Violations:

Site ID:	421895
Site Name:	CHILTON AUTO BODY INC
Violation Date:	12-28-2018
Citation:	22 CCR 12 66262.34(f) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.34(f)
Violation Description:	Failure to properly label hazardous waste accumulation containers and portable tanks with the following requirements: "Hazardous Waste", name and address of the generator, physical and chemical characteristics of the Hazardous Waste, and starting accumulation date.
Violation Notes:	Returned to compliance on 01/28/2019. The date is missing on the waste waterborne paint (only month provided). The used oil and waste antifreeze labels are missing from containers at the welding shiop. The bondo dust container at the welding shop does not have an EPA ID number so the address listed is not accurate. Update labels and provide evidence of correction to Env. Health within 30 days.
Violation Division:	San Mateo County Environmental Health
Violation Program:	HW
Violation Source:	CERS

Site ID:	421895
Site Name:	CHILTON AUTO BODY INC
Violation Date:	12-02-2016
Citation:	22 CCR 23 66273.36 - California Code of Regulations, Title 22, Chapter 23, Section(s) 66273.36
Violation Description:	Failure of universal waste handler to provide initial and/or annual refresher training for employees who manage or handle universal waste and to maintain a written record for three years of personnel who took

CHILTON AUTO BODY INC (Continued) **S121781001**

	the initial or annual training.
Violation Notes:	Returned to compliance on 01/12/2017. Facility generates a small amount of universal waste on site. A florescent bulb was found in the storage area and appeared to be stored unprotected, with the trash. Universal waste aerosols may also be collected in the future. Provide adequate training to employees who handle universal waste to ensure that all universal wastes (ex. non-empty aerosols, fluorescent bulbs, and small batteries) are handled properly and prevented from entering the trash. Provide evidence of completion to Env. Health within 30 days.
Violation Division:	San Mateo County Environmental Health
Violation Program:	HW
Violation Source:	CERS
Site ID:	421895
Site Name:	CHILTON AUTO BODY INC
Violation Date:	12-02-2016
Citation:	40 CFR 1 265.33 - U.S. Code of Federal Regulations, Title 40, Chapter 1, Section(s) 265.33
Violation Description:	Failure to test and maintain as necessary all facility communications or alarm systems, fire protection equipment, spill control equipment, and decontamination equipment to assure its proper operation in time of emergency.
Violation Notes:	Returned to compliance on 01/12/2017. Facility had fire extinguishers, a first aid kit, and an eyewash station on site. Fire extinguishers observed were properly certified however one in the paint area was missing the location sign. The eyewash station inspection label did not indicate when/if the fluid had been changed out. Continue to inspect and maintain safety equipment at your facility. Provide evidence that the eyewash station has been maintained within 30 days to Env. Health.
Violation Division:	San Mateo County Environmental Health
Violation Program:	HW
Violation Source:	CERS
Site ID:	421895
Site Name:	CHILTON AUTO BODY INC
Violation Date:	12-02-2016
Citation:	40 CFR 1 265.173 - U.S. Code of Federal Regulations, Title 40, Chapter 1, Section(s) 265.173
Violation Description:	Failure to meet the following container management requirements: (a) A container holding hazardous waste must always be closed during storage, except when it is necessary to add or remove waste. (b) A container holding hazardous waste must not be opened, handled, or stored in a manner which may rupture the container or cause it to leak.
Violation Notes:	Returned to compliance on 12/02/2016. The drums of used oil and antifreeze stored in the storage area near the metal shop and detail area were left open. Keep containers closed except when filling/draining them. Waste oil and antifreeze containers were closed during the inspection. Corrected on site.

Citation:	22 CCR 12 66262.34(d) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.34(d)
Violation Description:	Failure to send hazardous waste offsite for treatment, storage, or disposal within 180 days (or 270 days if waste is transported over 200 miles) for a generator who generates less than 1000 kilogram per month if all of the following conditions are met: (1) The quantity of hazardous waste accumulated onsite never exceeds 6,000 kilograms. (2) The generator complies with the requirements of 40 Code of Federal Regulations section 262.34(d), (e) and (f). (3) The generator does not hold acutely hazardous waste or extremely hazardous waste in an amount greater than one kilogram for more than 90 days.
Violation Notes:	Returned to compliance on 01/26/2017. No used oil manifest was able to be located during the inspection. Provide evidence that the used oil has been disposed of within the last 180 days. Currently the container does not met point of generation requirements. The container is not under the control of one person, nor is it located at the point of

CHILTON AUTO BODY INC (Continued) **S121781001**

waste generation. It is currently located in a storage area near the metal and detail shops. Provide evidence of completion to Env. Health within 30 days.

Violation Division: San Mateo County Environmental Health
Violation Program: HW
Violation Source: CERS

Site ID: 421895
Site Name: CHILTON AUTO BODY INC
Violation Date: 12-28-2018
Citation: 22 CCR 12 66262.11 - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.11
Violation Description: Failure to determine if wastes generated are hazardous waste by using generator knowledge or applying testing method.
Violation Notes: Returned to compliance on 04/04/2019. 4 metal 55 gallon drums and 2 5 gallon pails behind the 49 Railroad facility were labeled as acetone or were not labeled. It is not clear what is stored in these drums. Label them with their contents. Based on their determination, handle them properly. One 30 gallon drum labeled waterborne cleaning solvent is stored on the 49 Railroad lot next to the gate. The contents are unknown but the drum appears to be waste. Label them with their contents. Based on their determination, handle them properly. Provide Env. Health with an explanation within 30 days.

Eval Type: Routine done by local agency
Eval Notes: Last accepted submittal: Jun. 4, 2018. Please update the emergency contacts last submitted. Manager has changed. The welding shop is currently storing about 500-600 CF of CO2/argon, 100-200 CF acetylene and oxygen. There is also a 55 gallon drum for bondo dust stored at the welding shop. Based on this inventory and the separate address, it appears the facility will be required to submit a separate HMBP. Submit this within 30 days.
Eval Division: San Mateo County Environmental Health
Eval Program: HMRRP
Eval Source: CERS

Eval General Type: Other/Unknown
Eval Date: 01-26-2017

CHILTON AUTO BODY INC (Continued) **S121781001**

Violations Found:	No
Eval Type:	Other, not routine, done by local agency
Eval Notes:	Based on the inspection and previously submitted pictures, violations are closed. Used oil was reported to not be collected at the facility and the drum was determined to be empty. The violation is listed as unresolvable. Typically the facility only does radiator repair. Based on the operations, the facility will schedule a regular pickup to document that the used oil drum was serviced by Safety Kleen on schedule. Please see the used oil management fact sheet and SMC website for your options. http://www.smchealth.org/sites/main/files/file-attachments/usedoilforgenerators.pdf

Eval Notes:	Drums behind the building, on observation, had been removed. I spoke with Bill on a follow-up call 4/4/19 and he said that they had been picked up and he would send over the manifest. No signature obtained during the inspection. Re-inspection planned for 4/10/19 to review missing manifest copies.

Completed Info:

Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Voluntary Cleanup Consultation
Completed Date:	08/19/1998
Comments:	DTSC provided review and comment on the lead cleanup levels developed by the City of San Mateo for this redevelopment project. Lead originated from house paint on the houses which we scheduled to be demolished. A cleanup level of 400 parts per million average and 840 ppm maximum for lead was set. DTSC only provided consultatives services on the project.
Completed Area Name:	PROJECT WIDE

Waste Description:	SILVER
Waste Code:	F001
Waste Description:	THE FOLLOWING SPENT HALOGENATED SOLVENTS USED IN DEGREASING: TETRACHLOROETHYLENE, TRICHLORETHYLENE, METHYLENE CHLORIDE, 1,1,1-TRICHLOROETHANE, CARBON TETRACHLORIDE AND CHLORINATED FLUOROCARBONS; ALL SPENT SOLVENT MIXTURES/BLENDS USED IN DEGREASING

MILLS HEALTH CENTER (Continued) **1000291979**

CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F002, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste Code: F002
Waste Description: THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2, TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

SUNRISE CLEANERS (Continued) **1000362763**

Local Agency:	Not reported
RB Case Number:	41S0188
File Location:	All Files are on GeoTracker or in the Local Agency Database
Potential Media Affected:	Indoor Air, Soil, Soil Vapor, Under Investigation
Potential Contaminants of Concern:	Tetrachloroethylene (PCE), Stoddard solvent / Mineral Spriits / Distillates
Site History:	This site has contamination from a former dry cleaning operation. Soil and groundwater investigations have determined that soil, soil gas and groundwater have been affected. A feasibility study was conducted on the efficacy of the soil vapor extraction and groundwater extraction wells installed in December of 2013. Further investigations and remedial work plans are pending. .

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.
HAZARDOUS AIR POLLUTANT MAJOR

professional interpretations made in the referenced report. The site is a 30-foot wide by 130-foot long parcel of land fronting the north side of Baldwin Avenue in downtown San Mateo between North San Mateo Drive and North Ellsworth Avenue. The parcel immediately behind the site to the south at 22 N. San Mateo Drive is occupied by Mateo Garden Apartments, a group of two-story apartment buildings. The parcel to the east at 235 Baldwin is a dry cleaner. The parcel to the west at 210 Baldwin is a two-story office building. Existing site improvements include two structures that date back to the 1930s, including a main building fronting Baldwin Avenue and a separate 12-foot wide by 30-foot long building at the rear of the property. In the early 1990's, a 25-foot wide by 36-foot long building and wooden deck patio addition covering most of the remaining property was constructed at the rear of the parcel; the addition has served as the banquet hall for the Bella Mangiata Restaurant, the current tenant and leaseholder since the early 1990's. Mr. Michael Chang owns both the site and the adjacent property to the east at 235 Baldwin Avenue. Between the early 1930s to early 1980s, Sunrise Cleaners (the dry cleaner currently operating at 235 Baldwin Avenue) used the site for dry cleaning operations: the front building at the site was used as storefront. The rear building at the site was used for cleaning activities at least through the 1950's. Subsurface contamination was first documented in March 2006, following complaints of paint/solvent-like odors inside the banquet hall. A contractor was hired by the landlord to determine the cause of the odors. This led to the discovery of three vent lines and an abandoned steel UST (UST #1) positioned in a vertical configuration beneath the floor. The tank removal contractor estimated the capacity of the tank to be approximately 2,000-gallons. Upon its permitted removal during September 2006, the tank dimensions were reported to be approximately 5 feet wide by 8 feet long, or approximately 1,100 to 1,200 gallons. Use of the banquet hall was discontinued following tank removal activities. At the time of discovery, the tank was reportedly filled with a liquid that was later identified as water containing a low concentration of Stoddard solvent. Sludge at the bottom of the tank was also noted. The UST was apparently abandoned in the late 1950s or early 1960s when, according to industry reports, most dry cleaners switched from Stoddard solvent to perchloroethylene (PCE). In March 2006, under contract by the property owner, Express Plumbing of San Mateo, CA performed a video inspection of the vent lines at the rear building and also inspected beneath the banquet hall deck to locate possible USTs. A series of holes were cut into the deck to enable visual and physical access to soil beneath the deck. Hand excavations were made at each location to inspect the shallow soil. One of the locations was dug to approximately 5 feet below ground surface (bgs) exposing the top of a vertically positioned steel UST. In the process of exposing the USTs Express Plumbing created a pit that was approximately 8 feet wide, 9.5 feet long and 5 feet deep. Approximately 13 bank cubic yards (bcy) of soil spoils were off-hauled and disposed off at a landfill. Five steel pipes were encountered in the tank pit and partially cut and removed. Three other pipes and several concrete slabs were partially exposed in other locations. In April and May 2006, Clearwater Environmental Mgmt Inc. of Union City, CA, (Clearwater) sampled the contents of the UST and also the soil alongside the UST. The samples were analyzed for volatile organic compounds (VOCs) semi-VOCs (SVOCs), CAM 17 metals, and Total Recoverable Petroleum Hydrocarbons (TRPH) by a CA state

BELLA MANGIETA (Continued) **S108418328**

certified analytical laboratory. The liquid sample contained 6.4 milligrams per liter (mg/l) TRPH, and several VOCs representative of Stoddard solvent compounds including 940 micrograms per liter (ug/l) 1,2,4-trimethylbenzene, 240 ugll 1,3,5-trimethylbenzene, and trace levels of toluene and xylenes. The soil sample contained 36 milligrams per kilogram (mg/kg) TRPH and some of the same VOCs found in the liquid sample. On August 11, 2006, Geomatrix of Mountlake Terrace, Washington (contracted by the tenant) sampled the contents of the UST from the liquid surface (TANK-W1-081106). The same day, Clearwater used a vacuum tank truck to remove the liquid from the UST. Contents were hauled and disposed of at a licensed recycler under manifest. Geomatrix then collected a sample of the sludge remaining at the bottom of the tank (TANK-S-081106). Samples were analyzed for a wide range of constituents including VOCs, SVOCs, and total petroleum hydrocarbons as gasoline. Stoddard solvent, diesel, and motor oil (TPHg, TPHss, TPHd, and TPHmo, respectively) by a CA state certified analytical laboratory. Most notably, the liquid sample contained 12,000 ug/l TPHg and the sludge sample contained 20,000 mg/kg TPHg. However, the laboratory noted that the chromatographic pattern for the gasoline range organics resembled Stoddard solvent rather than gasoline. On August 31, 2006, Cruz Brothers was contracted by Clearwater to perform an underground utility survey to further locate the three suspected vent pipes. One of the pipes extended toward the adjacent property to the southwest, and the remaining two ran beneath the banquet hall addition toward the UST. A metal detector was also used to locate other possible abandoned USTs but none were found. On September 12 through 14, 2006, Clearwater transferred the sludge from the UST into a 55-gallon drum, cleaned the interior of the tank, cut the tank into pieces, and then removed it. All sludge, liquid wastes and tank debris were off-hauled and disposed of at a licensed recycling facility under manifest. According to Geomatrix, there were no holes, cracks, or obvious signs of leakage in the shell of the tank. There was; however, a strong solvent odor present in the open pit following tank removal. Geomatrix collected a bottom soil sample from beneath the tank (TANK-S-03) and one from the north sidewall (TANK-S-04) of the tank pit. The bottom sample contained 17 mg/kg TPHg and 10 mg/kg TPHss: the north sidewall sample contained 4,400 mg/kg TPHg and 2,500 mg/kg TPHss. Again, the laboratory noted that the chromatographic pattern for the gasoline range organics resembled Stoddard solvent rather than gasoline. In October 2006, Geomatrix conducted a review of historic site documents including Sanborn Maps and City of San Mateo Building Department records. The review revealed that the original dry cleaning buildings were constructed in the 1930s, but no records for USTs were found. A preliminary risk assessment that included an evaluation of acute and chronic effects of worker exposure to Stoddard solvent vapors was also conducted. Based on 4,400 mglkg TPHg and 2,500 mg/kg TPHss in the soil sample collected adjacent to the tank and using conventional transport modeling with conservative default assumptions for soil porosity and attenuation, an indoor air concentration of 10,500 micrograms per cubic meter (ugIm3) was predicted. This concentration is well above the odor threshold for TPHg vapor, which is considered similar to TPHss vapor with respect to the odor emissions. However, this concentration is well below all Occupational Safety and Health Administration (OSHA) and National Institute for Occupational Safety and Health (NIOSH) ceiling levels for worker exposure to TPHss vapor, assuming 8-hour or 10-hour

BELLA MANGIETA (Continued) **S108418328**

workdays. With respect to concerns associated with long-term exposure to low levels of Stoddard solvent vapors, Geomatrix predicted that the indoor air concentration was well above the San Francisco Regional Water Quality Control Board (RWQCB) commercial environmental screening level (ESL) for TPHg vapors which could be compared to Stoddard solvent vapors based on similar common carbon range compounds (C6 to C12). In January 2007, Advanced Geological Science, Inc. (AGS) performed a geophysical survey at the site to locate other possible USTs. They surveyed the entire banquet room area using a magnetometer and ground penetrating radar (GPR). Test results were negative. Similar to Cruz Brothers previous work, AGS applied an electrical current to the suspected vent pipes. Results differed from those of Cruz Brothers in that some of the piping routes did not match. In February 2007, ACC Environmental Consultants (ACC) of Oakland, California advanced ten soil borings (B1 through B10) to depths ranging from 8 feet to 25 feet bgs to delineate the extent of soil and groundwater contamination. Refusal at less than 2 feet bgs was met at two of the borings (B2 and B7) due to concrete slabs. Soil borings were sampled and logged at 5-foot intervals. Three grab groundwater samples and 20 soil samples were submitted for laboratory analysis. Groundwater was encountered at 25 feet bgs within more permeable sand strata that was first occurred at approximately 18 feet bgs. Groundwater samples contained 210 ug/l, 1,600 ug/1, and 130,000 ug/l TPHg with the highest concentration at Boring B4, located near the former UST. Only two of the twenty soil samples contained detectable TPHg concentrations. Concentrations were 2,100 mg/kg in Boring 84 at 18 feet and 23 mg/kg in Boring B-9 at 24 feet, both located in the capillary fringe. During the week of June 25, 2007, RRM subcontractors removed the majority of the wood deck flooring located in the banquet hall and covered patio area and the concrete floor in the former dry cleaning process room. Additionally, the wood fence at rear of the property was removed and replaced with temporary chain link fence panels to secure the sire. The section of deck covering the tank pit from UST #I was left in-place. RRM's Work Plan for Removal Actions, Interim Remedial Measures, Subsurface Investigations, and Pilot Testing was prepared in response to directives set forth in County correspondence dated May 31, 2007. The work plan presented a site conceptual transport and exposure model for a restaurant banquet room with a wood-deck floor overlying the backyard of an abandoned 1930-60s era dry cleaning facility that used Stoddard solvent. The conceptual model identified potential primary and secondary source areas and gaps in existing site data. The work plan proposed the following tasks: (1) removal of remaining wood deck flooring, rear wall of the banquet room, concrete floor of the former dry cleaning process room, and all concrete surfaces in the back yard area: (2) remove all abandoned USTs and UST piping and other inactive former dry cleaning operation piping and sample and analyze any suspect material under direction of County inspectors; (3) remove up to 500 bcy of contaminated soil, if encountered, under direction of County inspectors; (4) conduct exploratory excavations to 5 feet bgs to investigate areas of concern and collect and sample and analyze any suspect material under direction of County inspectors; (5) advance up to twelve direct-push borings to collect and analyze soil. groundwater, and vapor samples: (6) collect and analyze three sub-slab soil vapor samples; (7) install, develop, and sample three groundwater monitoring wells, one air-sparge well, and one soil vapor extraction (SVE) well and (8) perform air-sparge and SVE feasibility

BELLA MANGIETA (Continued) **S108418328**

testing. In the County correspondence dated August 6, 2007. Tasks 1, 2, 5, 6, and 7 were approved. Task 8 was denied, and additional explanation was requested for Tasks 3 and 4. In a letter dated August 20, 2007, RRM responded to questions and comments presented by the County in connection with Tasks 3 and 4 and strongly recommended that the County approve Task 8 in the interest of mitigating nuisance odors to allow the banquet hall to reopen. In their response dated August 6, 2007, the County approved Tasks 3 and 4, but again declined Task 8 on the basis that they would not approve pilot testing for interim remedial measures (IRMs) until site characterization work was complete and a feasibility study work plan was prepared and submitted. In September 2007, RRM subcontractors removed the remaining wood deck flooring and the lower half of the rear wall of the banquet hall. A mini-excavator was used to remove the concrete walkways and footings and to conduct exploratory trenching to locate and uncover other possible USTs and piping. The exploratory trenching followed the four vent lines from the southwest corner of the former dry cleaning process room and extended to depths of approximately 2 feet to 6 feet bgs. Three additional single-wall steel USTs (USTs #2 through #4) were discovered beneath the former wood deck (Figure 2). The piping connected to the USTs was exposed using the mini-excavator. Most of the piping led to the former dry cleaning process room. A 2-inch water line and an electrical conduit were identified in the area between the storage room and the main restaurant building where a previous utility survey identified a possible vent line. The approximate locations of the USTs and piping are shown on Figure 2. Also in September 2007, RRM conducted additional on-site investigation work. Seven direct-push exploratory borings were advanced up to 25 feet bgs using a limited access direct-push drill rig. A total of 16 soil samples, 5 grab-groundwater samples, and 6 soil vapor samples were collected and submitted for laboratory analysis. Analytical data is summarized in Tables 1 through 4. Sample analytical data show the presence of significant Stoddard solvent contamination in soil and groundwater including possible separate phase under the former banquet room floor. In an effort to complete the site investigation phase to the extent needed for the County to approve the pilot testing and implementation of the lRMs proposed in the July 2007 work plan, RRM prepared the Preliminary Subsurface Investigation Findings and Work Plan for Additional Subsurface Investigation, Well Installation, and Interim Remediation Pilot Testing, dated October 19, 2007. The work plan proposed additional on-site and off-site investigation work and feasibility testing for proposed IRMs. The lRMs were proposed to restore the use of the banquet hall by mitigating the vapor intrusion problems created from the former USTs and associated soil and groundwater contamination.

Case Type:	Cleanup Program Site
Case Worker:	KAW
Local Agency:	Not reported
RB Case Number:	41S0150
File Location:	Regional Board
Potential Media Affected:	Other Groundwater (uses other than drinking water), Soil, Surface water
Potential Contaminants of Concern:	Tetrachloroethylene (PCE)
Site History:	The Site (a former dry cleaner) is located downtown San Mateo. The Site was used for laundry cleaning until the 1970's where it shifted into a dry cleaning operation. Since the mid 80's the Site has been vacant. There is a building on the Site which is currently not utilized. The latest groundwater/ soil information was collected in 1998 and 1999. The analysis focused on metals and VOCs in soils and VOCs in groundwater. Arsenic ESLs are exceeded in shallow soils with a commercial/industrial screening and groundwater used for drinking water purposes. PCE, TCE, cis-DCE, VC ESLs are exceeded with similar screening site use scenario. PCE concentrations are as high as 640 ppb in groundwater. Piezometers are installed at the Site. Their adequacy for sampling purposes is unknown. There are no permanent groundwater monitoring points. The highest VOCs detections are found near a sump and sanitary sewer areas. It is the consultant position that off site contamination may have contributed to the groundwater impacts as detected near the sanitary areas. In May 2000, Water Board staff approved a mitigation plan (which has not been implemented) consisting of excavating X cubic feet of soil to a depth of 30 feet bgs. A site management plan, an updated health and safety plan and schedule for off-site are missing from the record. Full groundwater delineation has not been completed. A risk assessment dated March 2000, estimated the total excess cancer risk to 3x10E-7 for off site residents and 6X10E-8 for off site workers. The Site is slatted for mixed use redevelopment to include condos above businesses and a 3 levels garage (including one level at -10 feet bgs grade). However,

BLU-WHITE LAUNDRY (Continued) **1001610552**

as of July 2008 it is unclear if the current building will be razed in the near future. It is against city policy to tear down a building and leave a vacant lot.

Potential Media Affect:	Other Groundwater (uses other than drinking water)
Potential Contaminants of Concern:	Gasoline
Site History:	Extracted from Tetra Tech's December 8, 2006 REMEDIAL ACTION PLAN, San Mateo County does not take responsibility for the accuracy of the statements made or any professional interpretations made in the referenced report. The Site is located on the northeast corner of the intersection of El Camino Real and East Third Avenue in San Mateo, California. It was reportedly operated as a gasoline station from 1920 until 1992. The Site has been unoccupied since 1992. The Site lies within a mixed commercial and residential part of San Mateo. It is 105 feet wide and 105 feet long and zoned for commercial use. The adjacent property to the northeast contains a bank and other commercial properties. The adjacent property to the northwest is occupied by a parking garage. An active Unocal (former BP) gasoline station is located directly across El Camino to the southwest. A vacant lot that was a former Chevron gas station is located directly across East Third Avenue to the southeast. The property is flat and lies at an elevation of about 43 feet above mean sea level (msl). It is located between the Santa Cruz Mountains to the southwest and San Francisco Bay to the northeast. The closest surface water body is San Mateo Creek, located approximately 250 feet to the northwest of the site. San Francisco Bay lies approximately 1.3 miles northeast of the site. A total of eight phases of subsurface investigation have been performed at the Site since 1992 when the tanks were removed.1992 -

A & A BEACON (Continued) **S101303231**

Nine borings (BH-A through BH-J) were drilled to assess general subsurface conditions at the Site, 42 soil samples and 4 grab groundwater samples were collected and analyzed. 1993 - Two monitoring wells (LF-1 and LF-2) were installed upgradient and downgradient of the former tanks, and 4 soil samples were analyzed . 1994 - Three soil vapor extraction/groundwater monitoring wells (SVE-1, SVE-2, SVE-3) were installed. 1997 - Eight borings were advanced crossgradient and downgradient of the Site to assess the lateral extent of constituents in shallow groundwater; 6 grab groundwater samples (HP-1 through HP-6) were collected and two wells (MW-3 and MW-4) were installed. 2000 - Eleven borings (B-1 through B-11) were drilled at the Site to assess soil and groundwater conditions following remedial actions, 33 soil samples and 1 groundwater sample were collected and analyzed. 2001 - Four borings (SV-1 through SV-4) were advanced to assess soil gas concentrations at the Site; 12 soil gas samples were collected and analyzed. 2003 - Twelve soil samples were collected from soil located beneath the fuel dispensers, hydraulic hoists and oil water separator when the equipment was removed from the Site. 2005 - Seven borings (HP-9A, 9B, 10A, 10B, HP-11 through HP-13) were advanced along the upgradient and downgradient edges of the property and downgradient of the Site to further assess groundwater quality (7 grab groundwater samples were analyzed) and 2 borings (SG-5 and SG-6) were advanced at the Site to collect 4 samples of soil gas. Quarterly Groundwater Monitoring has been conducted at the Site since 1994. Five separate remedial activities have been conducted at the Site since 1992. In addition to removing physical features (underground storage tanks, other equipment), significant efforts have been made to address petroleum product detected in soil, in soil vapor and in groundwater. The work is described below: Underground Storage Tank (UST) removal and soil excavation. On October 15, 1992, four USTs were removed from the Site. Three USTs with capacities of 5000, 7500, and 10,000 gallons had been used to store gasoline and were located in the southeastern portion of the Site. The fourth tank (275 gallons), which had been used for storage of waste oil, was located behind the building in the northeastern portion of the Site. When the gasoline tanks were removed, they were found to have leaked and consequently soil containing petroleum beneath the tanks was excavated to depths of between 19 and 25 feet below ground surface (bgs). Approximately 800 cubic yards of material was removed and disposed of off-Site. The excavation was then backfilled with imported material. Soil Vapor Extraction Soil vapor was extracted from wells LF-1, SVE-1, SVE-2 and SVE-3 between June 1995 and December 1996 and treated using an internal combustion engine (ICE) under permit with the Bay Area Air Quality Management District (BAAQMD). During that period, the measurable separate-phase product was removed from well LF-1 and an estimated 392 gallons of gasoline were removed from the soil. Hydrogen Peroxide Injection Every week between April 1997 and September 1998, a 2 percent hydrogen peroxide solution was injected into four wells: LF-1, LF-2, SVE-1, and SVE-3. Between September 1998 and May 1999 smaller amounts of 35 percent hydrogen peroxide were injected into wells LF-1 and LF-2. We estimate that up to 300 gallons of gasoline may have been oxidized and eliminated from the subsurface during these activities. Product Dispenser, Hydraulic Hoist and Oil Water Separator removal and soil excavation Six product dispensers (and associated piping), three hydraulic hoists, and one oil-water separator (OWS) were removed from the Site in June 2003. No petroleum

A & A BEACON (Continued) **S101303231**

was detected in soil beneath the product dispensers but petroleum was detected in soil beneath the hoists and OWS inside the building. Approximately 15 cubic yards of soil was excavated from beneath the hoists and removed from the Site. The excavation was backfilled with imported fill. Clean soil removed during product dispenser and associated piping removal was placed back into trenches where the dispensers were located. Dual Phase Extraction A dual phase extraction system (DPE) was installed at the Site in 2003 and soil vapor and groundwater were extracted from wells SVE-2 and SVE-3 from November 2003 until February 2004. Initially the system was designed to extract soil vapor and groundwater from SVE-2, SVE-3 and LF-2 but ACC shut off extraction from well LF-2 after one week due to rapidly decreasing concentrations detected in soil vapor from LF-2. The DPE system treated soil vapor and groundwater using a process of air stripping, carbon adsorption and ICE. Treated soil vapor was released to the atmosphere under a BAAQMD permit and treated groundwater was discharged to the publicly owned treatment works (POTW) under permit. According to ACC, approximately 230 gallons of gasoline were removed from the subsurface by the DPE system.

Potential Media Affect:	Other Groundwater (uses other than drinking water)
Potential Contaminants of Concern:	Gasoline
Site History:	Extracted from Stantec's March 10, 2010, Groundwater Monitoring Report. More current site history is summarized in more recent reports. San Mateo County does not take responsibility for the accuracy of any statements or interpretations made in the consultants report. The site is an active 76-branded gasoline retail outlet located at the western corner of the intersection of El Camino Real and Third Avenue in San Mateo, California. BP acquired the property from Mobil Oil Corporation in 1989. In 1994, BP transferred the property to TOSCO Marketing Company and has not operated the facility since that time. The site is currently operated by ConocoPhillips (formerly TOSCO) as a 76-branded service station. There are no known plans to change site use. Except for several planters and the station building, the site is covered with concrete. The existing dispensers and underground storage tanks (USTs) are located in the north-central and northern portion of the site, respectively. A waste-oil tank is located west of the station building. The present USTs were installed in 1991 and consist of three double-wall fiberglass 10,000-gallon gasoline USTs and one double-wall fiberglass 1,000-gallon waste-oil UST. The former underground fuel tanks were located beneath the southern portion of the site, and consisted of one 4,000-gallon and two 6,000-gallon gasoline USTs. A former 285-gallon waste-oil tank was located at the site of the present waste-oil UST west of the service station building. The former USTs were removed in 1991. The site is located in a mixed commercial and residential area. The northern and eastern corners of the intersection of El Camino Real and Third Avenue were previously operated as a Beacon-branded station and Chevron-branded station, respectively. The former Beacon station is now a multi-level parking garage, and the former Chevron site is a parking lot. San Mateo Creek is located approximately 250 feet northwest of the site. A previous California Department of Water Resources well survey identified a City of San Mateo irrigation well approximately 1,300 feet southeast of the site. A January 4, 2001 Well Receptor Survey for the adjacent former Chevron site indicated that no water wells were within 400 feet of the Chevron site based on

BP OIL #11197 (Continued) **S101303232**

questionnaire mailings to property owners, reconnaissance, and tenant interviews of the survey area. Since 1989, multiple phases of investigation and remediation have been conducted at the site. A total of 14 monitoring wells have been installed, including eleven onsite wells (MW-1, MW-2, MW-3, MW-7, , MW-10, MW-11, RW-1, RW-2, RW-3, RW-4, and RW-5) and seven offsite wells (MW-4, MW-5, MW-6, MW-8, MW-9, MW-12, and MW-13). Five soil vapor extraction/air sparge (SVE/AS) wells (SVE/AS-1 through SVE-AS-5) were installed in 2005. Groundwater monitoring has taken place since 1990. Fourteen additional soil borings were drilled, including B-1, TB-1 through TB-5, CB-1S through CB-4S, and CB-1V through CB-4V. During tank replacement activities in 1991, soil in the UST vicinity was excavated to a depth of approximately 15 feet below ground surface (bgs) and soil in the western dispenser island vicinity was excavated to approximately 4 feet bgs. Wells MW-1 and MW-2 were destroyed during the 1991 tank replacement activities. Well MW-3 was paved over in 1992 and was uncovered intact in the fourth quarter of 2008. Interim remedial action took place in the late third quarter of 2000, involving the injection of 330 gallons of 7.5% hydrogen peroxide solution into wells MW-4 through MW-6 during four weekly events and to wells RW-2, RW-4, and RW-5 during one event to enhance natural attenuation. Based on the findings, Cambria proposed enhanced natural attenuation using hydrogen peroxide as the remedial approach. However, SMCHSA rejected this proposal due to insufficient data demonstrating stabilized hydrocarbon concentrations in site wells. A dual-phase extraction (DPE) pilot test was performed by URS from April 28 through May 1, 2003. The results of the DPE pilot test indicated that DPE could be implemented at the site. URS proposed additional pilot testing for in-situ enhanced bio-remediation alternatives. SMCHD rejected this proposal in a letter dated January 11, 2005. In response, URS recommended an AS/SVE feasibility study that was accepted by the SMCHD. In August and September 2005, URS installed two onsite monitoring wells (MW-10 and MW-11), two offsite monitoring wells (MW-12 and MW-13), and five dual-completion SVE/AS remedial wells (SVE/AS-1 through SVE/AS-5). The results of this investigation were reported in URS Well Installation Report, dated November 22, 2005. In November 2005, TRC Inc. (TRC) conducted a 4-day SVE/AS pilot test on the new remedial wells. The AS test was terminated after one day when field measurements indicated low to no response to air sparging. The remainder of the SVE test was completed, resulting in an estimated 46 to 48 foot radius of influence. In URS January 31, 2006 Feasibility Study and Revised Corrective Action Plan, DPE was proposed for implementation at the site to reduce the mass of hydrocarbons in soil and groundwater. The SMCHD accepted DPE as the remedial approach in a letter dated May 11, 2006. SECOR submitted a Remedial Action Work Plan, dated July 6, 2006, proposing a DPE system design using a thermal oxidizer and granular activated carbon to treat extracted vapor and groundwater, respectively. SMCHD approved the work plan in a letter dated December 6, 2006. Stantec (formerly SECOR) and Stratus Environmental Inc. completed DPE system installation in January 2009. On April 1, 2009, BP transferred the site to Delta Environmental as part of an environmental liability transfer contract executed by Delta. Delta will perform start-up of the DPE system in the second quarter of 2009. Stantec submitted a Remediation System Installation Report, dated April 3, 2009, documenting the installation of the DPE system and piping connections. Individual two-inch diameter Schedule 40

BP OIL #11197 (Continued) **S101303232**

Polyvinyl Chloride (Sch 40 PVC) extraction conduits were run underground from a manifold within the remediation compound and connected to existing wells RW-2, RW-4, RW-5, and SVE-1 through SVE-5. Two additional future extraction conduits were also installed during the installation activities. The future conduits were terminated and capped directly southwest of well SVE-2 and are housed within a traffic rated vault at the point of termination. The ten extraction conduits were connected to the extraction and abatement equipment. On October 27, 2009, BP transferred the environmental consulting responsibilities from Delta Environmental to Stantec.

Longitude:	-122.316567823291
Case Type:	Cleanup Program Site
Case Worker:	DGM
Local Agency:	SAN MATEO COUNTY LOP
RB Case Number:	Not reported
File Location:	All Files are on GeoTracker or in the Local Agency Database
Potential Media Affected:	Soil
Potential Contaminants of Concern:	Lead, Diesel, Waste Oil / Motor / Hydraulic / Lubricating
Site History:	September 2005 - four agencies inspected the property and identified various waste storage and disposal violations. Soil in a garbage can contained 42,000 mg/kg TPH-motor oil (TPH-mo) and 34,000 mg/kg TPH-diesel. A sample of the soil on the ground in the center of the site contained 55,000 mg/kg TPH-mo and 35,000 mg/kg TPH-diesel. September 2006 - surface soils were reportedly excavated. No details were provided to the oversight agency. March 2008 - Borings B-1 through B-7 were drilled to collect soil and groundwater samples. The soil samples were reported to contain up to 3,800 mg/kg TPH and 800 mg/kg of lead. Waste Extraction Testing of B-2 soil at 0.5 feet below grade (fbg) yielded 23 mg/l of lead. Refer to the 4/18/08 report. August 2016 - an approximately 30 foot x 30 foot area in the southern corner of the site was excavated to a depth of 1.5 fbg and the excavated soils were transported to the Chemical Waste Management disposal facility. Summary information is in the 2/28/17 monitoring well installation report. September 2016 - installed Monitoring Wells MW-1 through MW-3. The groundwater samples from the wells contained minimal impact. Refer to the 2/28/17 report. December 2016 - drilled Borings SPB-1 and SPB-2. No report was submitted to GeoTracker, but soil sampling results on other report tables did not identify significant impact. June 2017 - drilled Boring B-8. Refer to 12/4/17

SC PROPERTIES (Continued) **S106101929**

report. August 2018 - additional soil excavation performed northwest and north of the August 2016 soil excavation. Refer to the 11/20/18 report. October 2018 - development and sampling of an unknown monitoring well discovered immediately northwest of the August 2016 soil excavation. No groundwater impact was reported. Refer to 10/22/18 report. November 2018 - destroyed Monitoring Wells MW-1 through MW-3 and the unknown well discovered near the August 2016 soil excavation (Unk-1). Refer to 11/21/18 report.

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

THE TOWERS (Continued) **S106933068**

Eval Date:	10-02-2017
Violations Found:	No
Eval Type:	Routine done by local agency
Eval Notes:	I met with Tatiana Shestakov to follow-up on the initial inspection report from 9/25/17. On this visit we reviewed the HMBP including the map. The plan was in the office and will be available for review .Tatiana indicated that she would keep all the environmental documents together in a binder for future inspections. The fire extinguishers and first aid kit were both located for addition to the map. The spill kit was located in the generator room. The tank is located immediately outside the building and the generator is inside the building, below grade, approximately underneath the generator tank. We discussed the training plan requirements, including documenting the training for the two managers and one doorman. Submit an updated HMBP (in the online portal) and training records to Env. Health by Oct. 25th per the last inspection report.

Eval Source:	CERS
Eval General Type:	Compliance Evaluation Inspection
Eval Date:	10-22-2019
Violations Found:	No
Eval Type:	Routine done by local agency
Eval Notes:	An aboveground diesel tank (250 gal) fuels a below grade emergency generator and fire pumps system (includes power to building and water supply). Piping to generator from tank is does not have secondary containment. Continue to inspect this piping regularly to ensure no leaks occur in the diesel fuel line in steel pipes. Tatiana is the property manager on site for the owners associate which submits the business plan. Federal hazard categories updated and HMBP certified during the inspection.

THE TOWERS (Continued) **S106933068**

report from 9/25/17. On this visit we reviewed the HMBP including the map. The plan was in the office and will be available for review .Tatiana indicated that she would keep all the environmental documents together in a binder for future inspections. The fire extinguishers and first aid kit were both located for addition to the map. The spill kit was located in the generator room. The tank is located immediately outside the building and the generator is inside the building, below grade, approximately underneath the generator tank. We discussed the training plan requirements, including documenting the training for the two managers and one doorman. Submit an updated HMBP (in the online portal) and training records to Env. Health by Oct. 25th per the last inspection report.

Eval Division: San Mateo County Environmental Health

Eval Program: HMRRP
Eval Source: CERS

Eval General Type: Compliance Evaluation Inspection
Eval Date: 10-22-2019
Violations Found: No
Eval Type: Routine done by local agency
Eval Notes: An aboveground diesel tank (250 gal) fuels a below grade emergency generator and fire pumps system (includes power to building and water supply). Piping to generator from tank is does not have secondary containment. Continue to inspect this piping regularly to ensure no leaks occur in the diesel fuel line in steel pipes. Tatiana is the property manager on site for the owners associate which submits the business plan. Federal hazard categories updated and HMBP certified during the inspection.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 04/27/2021

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Federal CERCLIS list

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 02/22/2021

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Data Release Frequency: Quarterly

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

RCRA-VSQG: RCRA - Very Small Quantity Generators (Formerly Conditionally Exempt Small Quantity Generators)

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Very small quantity generators (VSQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

Data Release Frequency: Quarterly

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

Date of Government Version: 06/10/2021

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

RCRA NonGen / NLR: RCRA - Non Generators / No Longer Regulated

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing

Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water boards review found that more than one-third of the region's active disposal pits are operating without permission.

WDR: Waste Discharge Requirements Listing

In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

EDR Hist Cleaner: EDR Exclusive Historical Cleaners

EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Date of Government Version: 03/24/2021
Date Data Arrived at EDR: 05/11/2021
Date Made Active in Reports: 07/28/2021
Number of Days to Update: 78

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

UTM X (Meters):	560126.8
UTM Y (Meters):	4157670.0
Elevation:	22 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	5640626 SAN MATEO, CA
Version Date:	2012

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

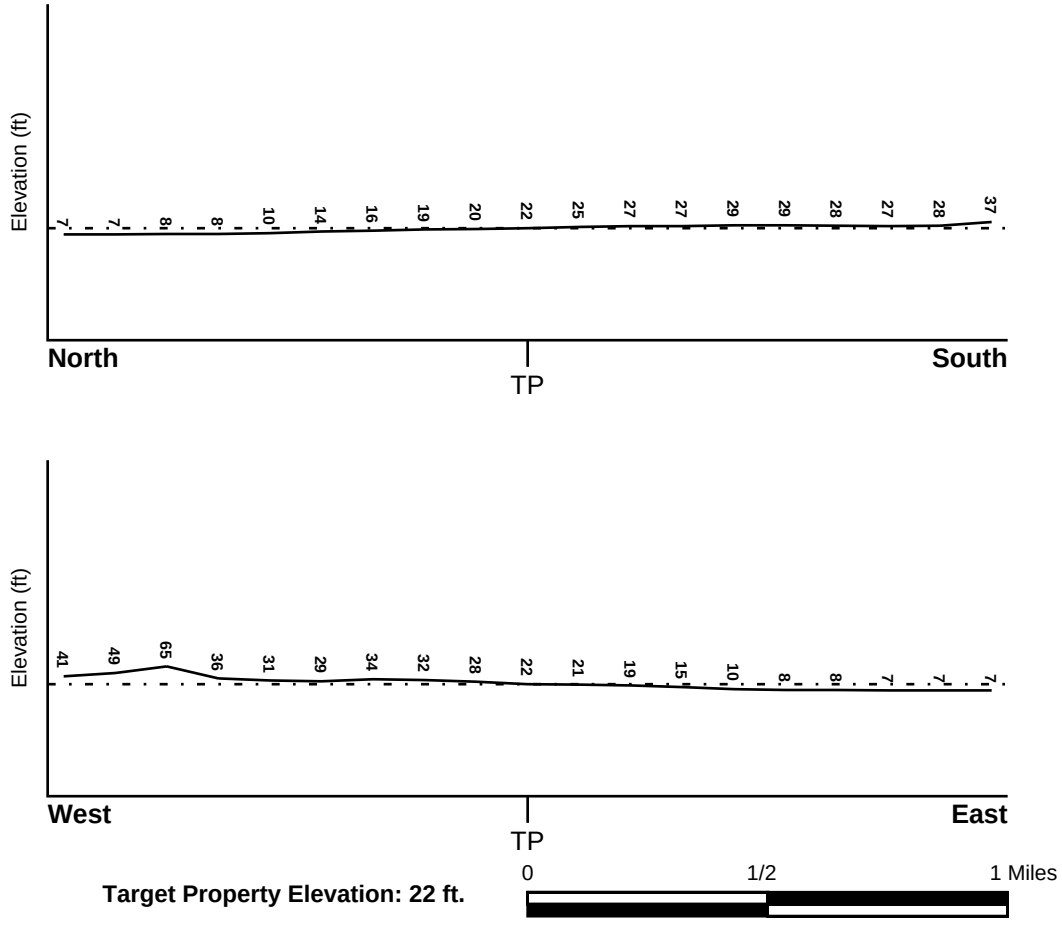
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General ENE

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Target Property Elevation: 22 ft.

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06081C0154F	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type

06081C0166F	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
SAN MATEO	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: Urban land

Soil Surface Texture:
Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class:
Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	5 inches		Not reported	Not reported	Max: 0.01 Min: 0	Max: Min:

Soil Map ID: 2

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory
Source: Department of Fish and Wildlife
Telephone: 916-445-0411

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

OTHER STATE DATABASE INFORMATION

Groundwater Ambient Monitoring & Assessment Program
State Water Resources Control Board
Telephone: 916-341-5577
The GAMA Program is Californias comprehensive groundwater quality monitoring program. GAMA collects data by testing the untreated, raw water in different types of wells for naturally-occurring and man-made chemicals. The GAMA data includes Domestic, Monitoring and Municipal well types from the following sources, Department of Water Resources, Department of Heath Services, EDF, Agricultural Lands, Lawrence Livermore National Laboratory, Department of Pesticide Regulation, United States Geological Survey, Groundwater Ambient Monitoring and Assessment Program and Local Groundwater Projects.

Water Well Database
Source: Department of Water Resources
Telephone: 916-651-9648

California Drinking Water Quality Database
Source: Department of Public Health
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

California Oil and Gas Well Locations
Source: Dept of Conservation, Geologic Energy Management Division
Telephone: 916-323-1779
Oil and Gas well locations in the state.

California Earthquake Fault Lines
Source: California Division of Mines and Geology
The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

RADON

State Database: CA Radon
Source: Department of Public Health
Telephone: 916-210-8558
Radon Database for California

PHYSICAL SETTING SOURCE RECORDS SEARCHED

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

OTHER

Airport Landing Facilities: Private and public use landing facilities
Source: Federal Aviation Administration, 800-457-6656

Epicenters: World earthquake epicenters, Richter 5 or greater
Source: Department of Commerce, National Oceanic and Atmospheric Administration

California Earthquake Fault Lines: The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines, prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

APPENDIX C

AERIAL PHOTOGRAPHS

Appendix C
Historical Aerial Photographs Review
524 East 4th Avenue and 402 South Delaware Street
San Mateo, California

Subject Property

Date	Photo Quality	Comments
1943	Poor	Four to five buildings are shown on the site. Poor resolution prevents further determination.
1946	Fair	Five residences are present on the subject property.
1956	Fair	No significant change to the property compared to the 1946 photograph.
1963	Good	One residence and garage remain on the subject property.
1968	Fair	One building is present on the site.
1974	Good	The site is in use as a gas station with two buildings and a canopy.
1982	Fair	No significant change to the property compared to the 1974 photograph.
1993	Good	No significant change to the property compared to the 1982 photograph.
1998	Fair	No significant change to the property compared to the 1993 photograph.
2005	Good	No significant change to the property compared to the 1998 photograph.
2009	Good	No significant change to the property compared to the 2005 photograph.
2012	Good	No significant change to the property compared to the 2009 photograph.
2016	Good	No significant change to the property compared to the 2012 photograph. The site is shown as currently existing

Adjacent Properties

Date	Photo Quality	Comments
1943	Poor	The surrounding area is developed with primarily residential buildings and some commercial buildings. A lumber yard/mill is present south of the site.
1946	Fair	The adjacent property to the west is in use as a lumber yard.
1956	Fair	The property immediately west of the site is a gas station. Two gas station are present northeast of the site across Delaware Street.
1963	Good	No significant change to the vicinity compared to the 1956 photograph.
1968	Fair	No significant change to the vicinity compared to the 1963 photograph.
1974	Good	The property immediately west of the site no longer appears in use as a gas station.
1982	Fair	No significant change to the vicinity compared to the 1974 photograph.
1993	Good	A gas station is present north of the site. The gas station formerly northeast of the site no longer appears in use as a gas station. The lumber yard farther south of the site no longer appears in use.
1998	Fair	The former lumber mill area south of the site is being redeveloped.
2005	Good	No significant change to the vicinity compared to the 1998 photograph.
2009	Good	No significant change to the vicinity compared to the 2005 photograph.
2012	Good	No significant change to the vicinity compared to the 2009 photograph.
2016	Good	No notable change to the property compared to the 2012 photograph. The site vicinity is shown as currently existing.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

APPENDIX D

SANBORN® FIRE INSURANCE MAPS

Appendix D
Historical Sanborn Fire Insurance Maps Review
524 East 4th Avenue and 402 South Delaware Street
San Mateo, California

Subject Property

Date	Comments
1888	The site is occupied by four residences and associated outbuildings.
1891	One of the small residences on the site has been replaced by a larger one.
1897	No significant change to the site compared to the 1891 map.
1901	No significant change to the site compared to the 1897 map.
1908	One of the residences on the site is now shown as Merchants Hotel.
1920	The former hotel is now shown as apartments.
1950	One of the residences has been removed from the site, and two buildings labeled as "Rooms" are present.
1953	Four residences and two garages remain onsite.
1956	The map shows the residences as present on the 1950 map.
1961	Only three residences remain on the subject property.
1969	The site is shown as a gas station with one building present.

Adjacent Properties

Date	Comments
1888	The site vicinity is residential with several vacant lots. The area southeast of 5th Avenue is shown as grain land.
1891	No significant change to the site vicinity compared to the 1888 map.
1897	San Mateo Electric Light Company is present farther southwest of the site.
1901	No significant change to the site vicinity compared to the 1897 map.
1908	The previously vacant lot immediately west of the site is now occupied by a residence and an associated outbuilding. Additional commercial businesses are present farther southwest of the site, including a lumber yard and planning mill. A lumber yard and planning mill is also present southwest of 5th Avenue.
1920	The residence immediately west of the site is now shown as storage. A PG&E substation and a warehouse are present farther west of the site. Residences have been constructed southwest of 5th Avenue.
1950	The property immediately west of the site is now occupied by a lumber yard. Additional residences are present in the site vicinity and southwest of 5th Avenue.
1953	The property immediately west of the site is shown as a gas station. Two gas stations are present northeast of the site across Delaware Street.
1956	The site vicinity is as shown as on the 1950 map.
1961	A printing company is present northwest of the site, and several auto repair facilities are present farther west of the site.
1969	An additional gas station is present north of the site across the intersection of 4th Avenue and Delaware Street.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by PES Environmental, Inc. were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Disclaimer - Copyright and Trademark Notice

This Report contains certain information obtained from a variety of public and other sources reasonably available to Environmental Data Resources, Inc. It cannot be concluded from this Report that coverage information for the target and surrounding properties does not exist from other sources. **NO WARRANTY EXPRESSED OR IMPLIED, IS MADE WHATSOEVER IN CONNECTION WITH THIS REPORT. ENVIRONMENTAL DATA RESOURCES, INC. SPECIFICALLY DISCLAIMS THE MAKING OF ANY SUCH WARRANTIES, INCLUDING WITHOUT LIMITATION, MERCHANTABILITY OR FITNESS FOR A PARTICULAR USE OR PURPOSE. ALL RISK IS ASSUMED BY THE USER. IN NO EVENT SHALL ENVIRONMENTAL DATA RESOURCES, INC. BE LIABLE TO ANYONE, WHETHER ARISING OUT OF ERRORS OR OMISSIONS, NEGLIGENCE, ACCIDENT OR ANY OTHER CAUSE, FOR ANY LOSS OR DAMAGE, INCLUDING, WITHOUT LIMITATION, SPECIAL, INCIDENTAL, CONSEQUENTIAL, OR EXEMPLARY DAMAGES. ANY LIABILITY ON THE PART OF ENVIRONMENTAL DATA RESOURCES, INC. IS STRICTLY LIMITED TO A REFUND OF THE AMOUNT PAID FOR THIS REPORT.** Purchaser accepts this Report "AS IS". Any analyses, estimates, ratings, environmental risk levels or risk codes provided in this Report are provided for illustrative purposes only, and are not intended to provide, nor should they be interpreted as providing any facts regarding, or prediction orforecast of, any environmental risk for any property. Only a Phase I Environmental Site Assessment performed by an environmental professional can provide information regarding the environmental risk for any property. Additionally, the information provided in this Report is not to be construed as legal advice.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Report is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Report includes a search of available city directory data at 5 year intervals.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

San Ramon, California 94583

Attention: Mr. Tim Howard

RE: Stockpiled Soil Sampling for
Unocal Service Station #6390
402 South Delaware Street
San Mateo, California

Dear Mr. Howard:

This letter report summarizes the analytical results of the composite soil samples that were collected from the stockpiled soil at the referenced site. The soil analyses were conducted to comply with the local regulatory agency requirements for proper disposal of potentially contaminated soil.

On August 5, 1992, soil samples from approximately 150 cubic yards of stockpiled soil that had been excavated from the fuel tank pit were collected to determine proper disposal of the soil. Three composite soil samples (designated as Comp A, Comp B, and Comp C) were taken. Each composite sample consisted of four individual grab samples taken at various locations and at depths of approximately 2 feet into the stockpile. The individual samples were subsequently composited as one sample by the lab. The samples were collected in two-inch diameter, clean brass tubes, which were then sealed with aluminum foil, plastic caps and tape, and placed in a cooled ice chest for subsequent delivery to a certified laboratory for analysis. All samples were analyzed at Sequoia Analytical Laboratory in Concord, California, and were accompanied by properly executed Chain of Custody documentation. Sample point locations are as shown on the attached Site Plan, Figure 1.

On August 24, 1992, Kaprealian Engineering, Inc. (KEI) returned to the site to collect soil samples from approximately 650 cubic yards of additional stockpiled soil that had been excavated from the fuel tank pit. Thirteen composite samples (designated as Comp D, Comp E, Comp F, Comp G, Comp H, Comp I, Comp J, Comp K, Comp L, Comp M, Comp N, Comp O, and Comp P) were collected and stored as described above. Sample point locations are as shown on the attached Site Plan, Figure 2.

Also, on August 24, 1992, soil samples from approximately 50 cubic yards of aerated stockpiled soil (previously sampled as Comp A) at

2401 Stanwell Drive, Suite 400
Concord, California 94520
Tel: 510.602.5100 Fax: 510.687.0602

the referenced site were collected to determine proper disposal of the soil. One composite soil sample (designated as Comp 1) was taken. The sample was collected and stored as described above. Sample point locations are as shown on the attached Site Plan, Figure 2.

On October 14, 1992, KEI returned to the site to collect soil samples from approximately 50 cubic yards of stockpiled soil that had been excavated from the pump island area during dispenser replacement. One composite soil sample (designated as Comp Q) was collected and stored as described above. Sample point locations are as shown on the attached Site Plan, Figure 3.

On October 22, 1992, one composite soil sample (designated as Comp R) was collected and stored as described above, from an additional 50 cubic yards of stockpiled soil that had been excavated from the pump island area during dispenser replacement. Sample point locations are as shown on the attached Site Plan, Figure 3.

On November 30, 1992, one composite soil sample (designated as Comp 4) from approximately 50 cubic yards of aerated stockpiled soil (previously sampled as Comp R) was collected and stored as described above to determine proper disposal of the soil. Sample point locations are as shown on the attached Site Plan, Figure 4.

Soil samples were analyzed to determine concentrations of total petroleum hydrocarbons (TPH) as gasoline by EPA method 5030 in conjunction with modified 8015, and benzene, toluene, xylenes, and ethylbenzene by EPA method 8020. In addition, samples Comp D through Comp P were re-composited as Comp DE, Comp FG, Comp HI, Comp JK, Comp LM, Comp NO, and Comp P and analyzed for organic lead and total lead. Also, composite sample Comp J was analyzed for Ignitability and a 96-hour Acute Hazardous Waste Bioassay was conducted. Results of the soil analyses are summarized in Table 1 and Table 2. Copies of the laboratory analyses, and the Chain of Custody documentation are attached to this report.

Based on the analytical results of the soil samples, approximately 250 cubic yards of stockpiled soil, represented by samples Comp B, Comp C, Comp 1, Comp Q and Comp 4, were disposed of at Mountain View Landfill in Mountain View, California (an approved Class III disposal facility) by Dillard Trucking of Byron, California. However, prior to loading and off-hauling of the stockpiled soil, KEI recommended that if isolated areas of contamination were detected within the stockpiled soil, those portions of the soil be separately stockpiled for further treatment and sampling.

In addition, approximately 650 cubic yards of stockpiled soil (represented by Comp D, Comp E, Comp F, Comp G, Comp H, Comp I, Comp J, Comp K, Comp L, Comp M, Comp N, Comp O, and Comp P) were transported to Ben's Truck and Equipment in Red Bluff, California, for treatment and disposal.

DISTRIBUTION

A copy of this report should be sent to Ms. Sabrina Mih of the San Mateo County Department of Environmental Health, and to the Regional Water Quality Control Board, San Francisco Bay Region.

Should you have any questions on this report, please do not hesitate to contact me at (510) 602-5100.

Sincerely,

Kaprealian Engineering, Inc.

Deanna L. Harding
Technical Assistant

Attention: Mr. Tim Howard

RE: Preliminary Ground Water Investigation at
Unocal Service Station #6390
402 South Delaware Street
San Mateo, California

Dear Mr. Howard:

This report presents the results of Kaprealian Engineering, Inc's. (KEI) most recent soil and ground water investigation for the referenced site, in accordance with KEI's proposal (KEI-P92-0801.P2) dated April 11, 1994. The purpose of the investigation was to determine the ground water flow direction, and to begin to determine the degree and extent of soil and ground water contamination at the site. The scope of the work performed by KEI consisted of the following:

Coordination with regulatory agencies

Geologic logging of three borings for the installation of three monitoring wells

Soil sampling

Ground water monitoring, purging, and sampling

Delivery of soil and ground water samples (including Chain of Custody documentation) to a California-certified analytical laboratory for laboratory analyses

Data analysis, interpretation, and report preparation

SITE DESCRIPTION AND BACKGROUND

The subject site contains a Unocal service station facility. The site is located on flat terrain and is situated approximately one mile from the present day shoreline of San Francisco Bay. A Location Map and Site Plans are attached to this report.

KEI's initial field work was conducted on August 5, 1992, when one 12,000 gallon regular unleaded gasoline storage tank and one 12,000

2401 Stanwell Drive, Suite 400
Concord, California 94520
Tel: 510.602.5100 Fax: 510.687.0602

gallon super unleaded gasoline storage tank were removed from the site. The tanks were made of fiberglass, and no apparent holes or cracks were observed in the regular unleaded gasoline tank. However, the super unleaded gasoline tank had a nine-inch long crack located near the east end of the tank. Tank removal and soil sampling were performed in the presence of Ms. Sabrina Mih of the San Mateo County Department of Health Services (SMCDHS). Mr. Jorge Gomar of the SMCDHS was also present during tank removal.

Two soil samples, labeled A1 and B1, were collected from beneath the west ends of the fuel tanks at depths of about 15 feet below grade. Two soil samples, labeled A2(22) and B2(18), were collected from beneath the east ends of the fuel tanks at depths of approximately 22 feet and 18 feet below grade, respectively. Due to obvious soil contamination observed beneath the east ends of the fuel tanks and per the request of Ms. Mih, two soil samples, labeled SW1 and SW2, were collected from the south and east sidewalls of the fuel tank pit at depths of approximately 15 feet below grade. The undisturbed soil samples were collected from bulk material excavated by backhoe. Sample point locations are as shown on the attached Figure 3.

KEI returned to the site on August 11, 1992, when one 550 gallon waste oil storage tank was removed from the site. The tank was made of steel, and two holes of 3/16 inch in diameter were observed in the tank. Mr. Gomar was present during tank removal. One soil sample, labeled WO1, was collected from beneath the waste oil tank at a depth of about 8 feet below grade. In addition, six soil samples, labeled P1 through P6, were collected from beneath the product piping trenches at depths of approximately 3 feet below grade. The samples were collected and handled as previously described. Sample point locations are as shown on the attached Figure 3. Soil sampling was again performed in the presence of Ms. Mih.

On August 21, 1992, the east side of the fuel tank pit was additionally excavated to a depth of approximately 22 feet below grade (over an area of about 30 feet by 27 feet). Ground water was observed at a depth of about 21 feet below grade. In an attempt to define the extent of existing soil contamination in the vicinity of the sidewalls, three additional soil samples, labeled SW1(2.5), SW2(2.5), and SW3, were collected from the sidewalls of the additionally excavated fuel tank pit at depths of approximately 16 feet below grade. The samples were also collected from bulk material excavated by backhoe. Ms. Mih was again present during excavation and soil sampling activities. Sample point locations are shown on the attached Figure 3. Excavated soil was stockpiled on-site and sampled prior to disposal. After the soil sampling was

completed, approximately 1,000 gallons of contaminated ground water (with floating product and heavy sheen) were pumped from the fuel tank pit.

On August 25, 1992, an additional 4,800 gallons of ground water were pumped from the fuel tank pit. One water sample, labeled W1, was then collected from the fuel tank pit in four clean glass VOA vials and one-liter amber bottles.

KEI returned to the site on October 22, 1992, in order to collect soil samples from beneath the former product dispensers prior to the new piping installation. Three soil samples, labeled D1, D2, and D3, were collected at depths of about 7 feet below grade. These samples were also collected as previously described. Sample point locations are shown on the attached Figure 3.

The subsurface soils exposed in the excavations consisted primarily of clayey silt to the maximum depth explored (approximately 22 feet below grade). However, the subsurface soils exposed in the waste oil tank pit excavation consisted primarily of silt with some gravel. Ground water was encountered in the fuel tank pit at a depth of about 21 feet below grade.

All samples were analyzed by Sequoia Analytical Laboratory in Concord, California. Samples from the fuel tank pit were analyzed for total petroleum hydrocarbons (TPH) as gasoline by EPA method 5030/modified 8015, and benzene, toluene, ethylbenzene, and xylenes (BTEX) by EPA method 8020. The sample from the waste oil tank pit was analyzed for TPH as gasoline, TPH as diesel by EPA method 3550/modified 8015, BTEX, total oil and grease (TOG) by Standard Methods 5520E&F, EPA method 8010 constituents, and the metals cadmium, chromium, lead, nickel, and zinc. The sidewall soil sample SW3 and the water sample W1 (collected from the fuel tank pit) were analyzed for TPH as gasoline, TPH as diesel, and BTEX. The water sample was also analyzed for organic lead by the California LUFT Manual procedure. The results of the soil analyses are summarized in Tables 5 and 6. The results of the water analyses are summarized in Table 7.

Based upon the analytical results of the soil samples collected through October 1992, it appeared that the majority of the contaminated soil has been excavated and removed in the vicinity of the pump islands, the product piping trenches, the waste oil tank pit, and the western portion of the fuel tank pit. Contaminated soil was also excavated and removed in the eastern portion of the fuel tank pit to a depth of 22 feet below grade, where ground water was encountered. Free product and a heavy sheen was detected on the ground water within the eastern portion of the tank pit. The

eastern end of the super unleaded tank was observed to contain a nine-inch long crack during the removal of this tank.

Therefore, based on the analytical results of the soil and ground water samples collected through October 1992, and in accordance with the guidelines established by the Regional Water Quality Control Board (RWQCB), KEI concluded that further work was warranted at the site because of the levels of contamination found in the soil and water samples collected from the eastern portion of the fuel tank pit. To comply with the requirements of the RWQCB and the SMCDHS, KEI recommended the installation of three monitoring wells at the site in order to begin to define the extent of the soil and ground water contamination, and to determine the ground water flow direction.

RECENT FIELD ACTIVITIES

On May 24 and 25, 1994, three two-inch diameter monitoring wells (designated as MW1 through MW3 on the attached Figure 1) were installed at the site. The wells were each drilled, constructed, and completed in accordance with the guidelines of the RWQCB and the California Well Standards (per Bulletin 74-90). The subsurface materials penetrated and details of the construction of the wells are described in the attached Boring Logs and Well Construction Diagrams, respectively.

The three wells (MW1 through MW3) were each drilled and completed to total depths ranging from 28 to 30 feet below grade. Ground water was encountered at depths ranging from 17.5 to 20 feet below grade during drilling. Soil samples were collected for laboratory analysis and for lithologic logging purposes at a maximum spacing of 5 foot intervals, at significant changes in lithology, at obvious areas of contamination, and at or within the soil/ground water interface, beginning at a depth of approximately 5 feet below grade and continuing until ground water was encountered. A representative soil sample of the saturated zone was collected from the boring for well MW1 at a depth of 22.5 feet below grade and submitted for particle size analysis (sieve and hydrometer) for verification of filter pack and well screen design. Other soil sampling conducted below the water table was for lithologic logging purposes only. The undisturbed soil samples were collected by driving a California-modified split-spoon sampler (lined with brass liners) ahead of the drilling augers. The two-inch diameter brass liners holding the samples were then sealed with aluminum foil, plastic caps and tape, labeled, and stored in a cooler, on ice, until delivery to a state-certified laboratory.

Each well casing was installed with a watertight cap and padlock. A round, watertight, flush-mounted well cover was cemented in place over each well casing. The surface of each well cover and the top of each well casing was surveyed by Kier & Wright of Pleasanton, California, to Mean Sea Level (MSL) and to a vertical accuracy of 0.01 foot.

The new wells (MW1 through MW3) were developed on June 9 and 10, 1994. Prior to development, the wells were checked for the depth to the water table (by the use of an electronic sounder) and the presence of free product (by the use of an interface probe or paste tape). No free product was noted in any of the wells. After recording the monitoring data, the three wells were each purged (by the use of a surface pump) of 105 to 115 gallons of water until the evacuated water was clear and free of visible suspended sediment. Monitoring and well development data are summarized in Table 1.

The three wells (MW1 through MW3) were sampled on June 15, 1994. During monitoring, the wells were checked for depth to water and the presence of free product or sheen. No free product or sheen was noted in any of the wells. After recording the monitoring data, the wells were each purged of between 8 and 12 gallons of water by the use of a surface pump. During purging operations, the field parameters pH, temperature, and electrical conductivity were recorded and are presented in Table 2. Once the field parameters were observed to stabilize and a minimum of approximately four casing volumes had been removed from each well, water samples were then collected by the use of a clean Teflon bailer. The samples were decanted into clean VOA vials that were then sealed with Teflon-lined screw caps, labeled, and stored in a cooler, on ice, until delivery to a state-certified laboratory.

ANALYTICAL RESULTS

Water and selected soil samples from the borings of MW1 through MW3 were analyzed at Sequoia Analytical Laboratory. All samples analyzed were accompanied by properly executed Chain of Custody documentation. The samples were analyzed for TPH as gasoline by EPA method 5030/modified 8015, and BTEX by EPA method 8020.

The concentrations of TPH as gasoline and benzene detected in the ground water samples collected on June 15, 1994, are shown on the attached Figure 2. The results of the soil analyses are summarized in Table 4, and the results of the water analyses are summarized in Table 3. Copies of the laboratory analyses and the Chain of Custody documentation are attached to this report.

HYDROLOGY AND GEOLOGY

On June 15, 1994, the measured depth to ground water in the monitoring wells ranged from 15.33 to 16.71 feet below grade. The ground water flow direction appeared to be to the east, as shown on the attached Figure 1. The hydraulic gradient at the site on June 15, 1994, was approximately 0.004, based on water level data collected from the monitoring wells prior to purging.

Based on review of regional geologic maps (U.S. Geological Survey Professional Paper 943, "Flatland Deposits of the San Francisco Bay Region, California, Their Geology and Engineering Properties, and Their Importance to Comprehensive Planning," by E.J. Helley and K.R. Lajoie, et. al., 1979), the subject site is underlain directly by Holocene medium-grained alluvium (Qham), which is described as typically consisting of unconsolidated, well bedded, moderately sorted, moderately permeable fine sand, silt, and clayey silt with occasional thin beds of coarse sand. The thickness of these deposits generally does not exceed 12 feet. The site is also located closely adjacent to mapped geologic contacts of Holocene coarse-grained alluvium (Qhac), and late Pleistocene alluvium (Qpa). The older Qhac sequence is described as consisting of well bedded, unconsolidated, moderately sorted, permeable sand and silt, locally interbedded with coarse sand and gravel. The maximum thickness of this alluvial sequence is estimated at 50 feet. The Qpa deposits are the oldest of the sediments noted here and consist of weakly consolidated, slightly weathered, poorly sorted and irregularly interbedded clay, silt, sand, and gravel. The maximum thickness of the Qpa alluvial sequence is unknown, but is estimated to be at least 150 feet.

Based on the results of our subsurface studies, the site is underlain by fill materials to a depth of about 2 feet below grade. The fill is in turn underlain by alluvium to the maximum depth explored (30 feet below grade). The alluvium underlying the site consists predominantly of silty or clayey gravel and sandy or clayey silt. Lesser amounts of silty sand and silty clay are also present.

As of June 1994, the unsaturated zone beneath the site is approximately 16 feet thick and consists of silty or clayey gravel and sandy or clayey silt. The unsaturated zone consists predominantly of clayey, sandy or gravelly silt, and silty or sandy gravel. Lesser amounts of silty sand and clay have also been encountered. The units immediately above and below the water table are composed of silty sand in wells MW2 and MW3, and clay in well MW1.

The results of the particle size analysis (sieve and hydrometer) of the soil sample collected from the boring for monitoring well MW1 at a depth of 22.5 feet below grade indicate that the sample is composed of approximately 49% sand, 31% gravel, 11% clay, and 9% silt. However, the lab reported that the sample subjected to particle size analysis contained organic material that did not pass the No. 4 sieve, and therefore the resulting determination of percent gravel may be artificially elevated. The sample is classified as a silty sand with gravel (SM). The results of the particle size analysis are shown on the attached Particle Size Distribution sheets and Graph of Acquired Data.

DISCUSSION AND RECOMMENDATIONS

Based upon the analytical results of the soil and ground water samples collected and evaluated to date, the area of hydrocarbon-impacted soil and ground water at the site appears to be limited to the vicinity of the underground fuel storage tanks. In addition, based upon the analytical results of the soil and ground water samples collected from recently-installed wells MW2 and MW3, the extent of hydrocarbon contamination in the vicinity of the underground fuel storage tanks has not been delineated. However, before making recommendations pertaining to additional exploratory borings/monitoring wells or evaluation of potential remedial options, KEI recommends the implementation of a three month ground water monitoring and sampling program. The purpose of this three month program will be to attempt to establish consistent ground water flow directions and contaminant concentration levels at the site. Therefore, the existing wells will be monitored monthly and sampled at the end of the three month period. At that time, KEI will provide additional recommendations for further contaminant delineation and/or an evaluation of potential remedial activities at the site.

DISTRIBUTION

Copies of this report should be sent to the SMCDHS, and to the RWQCB, San Francisco Bay Region.

LIMITATIONS

Soil deposits and rock formations may vary in thickness, lithology, saturation, strength and other properties across any site. In addition, environmental changes, either naturally-occurring or artificially-induced, may cause changes in the extent and concentration of any contaminants. Our studies assume that the field and laboratory data are reasonably representative of the site as a whole, and assume that subsurface conditions are reasonably conducive to interpolation and extrapolation.

The results of this study are based on the data obtained from the field and laboratory analyses obtained from a state-certified laboratory. We have analyzed this data using what we believe to be currently applicable engineering techniques and principles in the Northern California region. We make no warranty, either expressed or implied, regarding the above, including laboratory analyses, except that our services have been performed in accordance with generally accepted professional principles and practices existing for such work.

Should you have any questions regarding this report, please do not hesitate to call at (510) 602-5100.

Sincerely,

Kaprealian Engineering, Inc.

Haig (Gary) Tejirian
Project Geologist

Joel G. Greger, C.E.G.

	OH	Organic clays of medium to high plasticity, organic silty clays, organic silts
HIGHLY ORGANIC SOILS	Pt	Peat and other highly organic soils

CLASSIFICATION CHART (Unified Soil Classification System)

BORING LOG

Project No. KEI-P92-0801	**Boring Diameter** 8.5" **Casing Diameter** 2"	**Logged By** JGG D.L. CE61633
Project Name Unocal S/S #6390 402 South Delaware Street, San Mateo	**Well Cover Elevation** N/A	**Date Drilled** 5/25/94
Boring No. MW1	**Drilling Method** Hollow-stem Auger	**Drilling Company** Woodward Drilling

Penetration blows/6"	G. W. level	Depth (feet) Samples	Strati-graphy USCS	Description
		0		A.C. Pavement over sand and gravel base.
			ML	Sandy silt, sand is very fine to fine-grained, hard, friable, moist, dark brown to dark reddish brown.
21/19/25		5	GM	Silty gravel with sand, trace clay, estimated at 15% silt, angular to rounded gravel to 1 inch in diameter, dense, slightly moist, dark brown and dark reddish brown, some gravel is weathered and decomposed.
12/15/23		10	GC	Clayey gravel with sand, trace silt, estimated at 15% clay, gravel to 1 inch in diameter, medium dense to dense, moist, dark yellowish brown.
9/11/14		15	CL	Silty clay, estimated at 10-15% sand and gravel to 5/8 inch in diameter, very stiff, moist, olive brown and dark yellowish brown, mottled, sand and gravel content decreasing with depth.
8/11/16				Silty clay, as above, trace sand.
			ML	Sandy silt, estimated at 5-15% clay, sand is fine to medium-grained, very stiff, moist to very moist, olive brown.
7/10/14	▽	20	GM	Silty gravel with sand, estimated at 15% silt, medium dense to dense, very moist to wet, olive brown grading to dark yellowish brown.

Project No. KEI-P92-0801	**Boring Diameter** 8.5" **Casing Diameter** 2"	**Logged By** JGG D.L. CEG 1633
Project Name Unocal S/S #6390 402 South Delaware Street, San Mateo	**Well Cover Elevation** N/A	**Date Drilled** 5/24/94
Boring No. MW2	**Drilling Method** Hollow-stem Auger	**Drilling Company** Woodward Drilling

Penetration blows/6"	G. W. level	Depth (feet) Samples	Strati-graphy USCS	Description
		0		Concrete slab
				Sand and gravel base.
			ML	Sandy silt, hard, friable, dry to slightly moist, dark yellowish brown.
				Clayey silt, estimated at 5-10% gravel and sand, hard, friable, slightly moist, dark yellowish brown, with roots and root holes.
15/23/40		5	GM	Silty gravel with sand, estimated at 15-20% silt, very dense, slightly moist, dark yellowish brown.
26/19/21		10		Silty gravel with sand, trace clay, gravel to 1 inch in diameter, slightly moist to moist, dark yellowish brown.
10/14/17			ML	Sandy silt, estimated at 5-10% clay, very stiff to hard, moist, dark yellowish brown, fissured, slightly disturbed.
12/9/11		15	SM	Silty sand, estimated at 15% silt, locally with up to 20% gravel to 3/4 inch in diameter, medium dense, very moist, dark yellowish brown.
			GM	Silty gravel with sand, dense, very moist to wet, olive to olive brown.
8/22/23	▽		SW	Well graded sand, trace fines, dense, wet, dark yellowish brown.
3/3/4		20	ML	Clayey silt, firm, moist, yellowish brown, with iron oxide staining.
				Silt, estimated at 20-30% very fine to fine-grained sand, firm, wet, yellowish brown and dark yellowish brown, mottled.

Please Note:
The LCS is a control sample of known, interferent free matrix that is analyzed using the same reagents, preparation, and analytical methods employed for the samples. The matrix spike is an aliquot of sample fortified with known quantities of specific compounds and subjected to the entire analytical procedure. If the recovery of analytes from the matrix spike does not fall within specified control limits due to matrix interference, the LCS recovery is to be used to validate the batch.

Please Note:
The LCS is a control sample of known, interferent free matrix that is analyzed using the same reagents, preparation, and analytical methods employed for the samples. The matrix spike is an aliquot of sample fortified with known quantities of specific compounds and subjected to the entire analytical procedure. If the recovery of analytes from the matrix spike does not fall within specified control limits due to matrix interference, the LCS recovery is to be used to validate the batch.

RE: Continuing Ground Water Investigation at
Unocal Service Station #6390
402 South Delaware Street
San Mateo, California

Dear Mr. Camille:

This report presents the results of Kaprealian Engineering, Inc's. (KEI) most recent soil and ground water investigation in the vicinity of the referenced site, in accordance with KEI's proposal (KEI-P92-0801.P3) dated December 13, 1994. The purpose of this investigation was to further define the degree and extent of soil and ground water contamination at and in the vicinity of the site. The scope of the work performed by KEI consisted of the following:

Coordination with regulatory agencies

Geologic logging of two borings for the installation of two monitoring wells

Soil sampling

Development of the newly-installed monitoring wells

Delivery of soil samples (including properly executed Chain of Custody documentation) to a California-certified analytical laboratory for laboratory analyses

Data analysis, interpretation, and report preparation

SITE DESCRIPTION AND BACKGROUND

The subject site contains an operating Unocal service station facility, and is located on the southwest corner of the intersection of 4th Avenue and South Delaware Street in San Mateo, California. The site occupies flat terrain and is situated approximately one mile from the present day shoreline of San Francisco Bay. A Location Map is attached to this report.

2401 Stanwell Drive, Suite 400
Concord, California 94520
Tel: 510.602.5100 Fax: 510.687.0602

KEI's initial field work was conducted on August 5, 1992, when one 12,000 gallon regular unleaded gasoline storage tank and one 12,000 gallon super unleaded gasoline storage tank were removed from the site. The tanks were made of fiberglass, and no apparent holes or cracks were observed in the regular unleaded gasoline tank. However, the super unleaded gasoline tank had a nine-inch long crack located near the east end of the tank. Tank removal and soil sampling activities were performed in the presence of Ms. Sabrina Mih of the San Mateo County Department of Health Services (SMCDHS). Mr. Jorge Gomar of the SMCDHS was also present during tank removal operations.

Two soil samples, labeled A1 and B1, were collected from beneath the west ends of the fuel tanks at depths of about 15 feet below grade. Two soil samples, labeled A2(22) and B2(18), were collected from beneath the east ends of the fuel tanks at depths of approximately 22 feet and 18 feet below grade, respectively. Due to obvious hydrocarbon-impacted soil observed beneath the east ends of the fuel tanks and per the request of Ms. Mih, two soil samples, labeled SW1 and SW2, were collected from the south and east sidewalls of the fuel tank pit at depths of approximately 15 feet below grade. The undisturbed soil samples were collected from bulk material excavated by backhoe. Sample point locations are as shown on the attached Figure 3.

KEI returned to the site on August 11, 1992, when one 550 gallon waste oil storage tank was removed from the site. The tank was made of steel, and two holes of 3/16 inch in diameter were observed in the tank. Mr. Gomar was present during tank removal activities. One soil sample, labeled WO1, was collected from beneath the former waste oil tank at a depth of about 8 feet below grade. In addition, six soil samples, labeled P1 through P6, were collected from the bottom of the product piping trenches at depths of approximately 3 feet below grade. The samples were collected and handled as previously described. Sample point locations are as shown on the attached Figure 3. Soil sampling was again performed in the presence of Ms. Mih.

On August 21, 1992, the east side of the fuel tank pit was additionally excavated to a depth of approximately 22 feet below grade (over an area of about 30 feet by 27 feet). Ground water was observed at a depth of about 21 feet below grade. In an attempt to define the extent of existing hydrocarbon-impacted soil in the vicinity of the sidewalls, three additional soil samples, labeled SW1(2.5), SW2(2.5), and SW3, were collected from the sidewalls of the additionally excavated fuel tank pit at depths of approximately 16 feet below grade. The samples were also collected from bulk material excavated by backhoe. Ms. Mih was again present during excavation and soil sampling activities. Sample point locations

are shown on the attached Figure 3. Excavated soil was stockpiled on-site and sampled prior to disposal. After the soil sampling was completed, approximately 1,000 gallons of hydrocarbon-impacted ground water (with floating product and heavy sheen) were pumped from the fuel tank pit.

On August 25, 1992, an additional 4,800 gallons of ground water were pumped from the fuel tank pit. One water sample, labeled W1, was then collected from the fuel tank pit in four clean glass VOA vials and one-liter amber bottles.

KEI returned to the site on October 22, 1992, in order to collect soil samples from beneath the former product dispensers prior to the new piping installation. Three soil samples, labeled D1, D2, and D3, were collected at depths of about 7 feet below grade. These samples were also collected as previously described. Sample point locations are again shown on the attached Figure 3.

The subsurface soils exposed in the excavations consisted primarily of clayey silt to the maximum depth explored (approximately 22 feet below grade). However, the subsurface soils exposed in the waste oil tank pit excavation consisted primarily of silt (with some gravel). Ground water was encountered in the fuel tank pit at a depth of about 21 feet below grade.

All samples were analyzed by Sequoia Analytical Laboratory. Samples from the fuel tank pit were analyzed for total petroleum hydrocarbons (TPH) as gasoline by EPA method 5030/modified 8015, and benzene, toluene, ethylbenzene, and xylenes (BTEX) by EPA method 8020. The sample from the waste oil tank pit was analyzed for TPH as gasoline, TPH as diesel by EPA method 3550/modified 8015, BTEX, total oil and grease (TOG) by Standard Methods 5520E&F, EPA method 8010 constituents, and the metals cadmium, chromium, lead, nickel, and zinc. The sidewall soil sample SW3 and the water sample W1 (collected from the fuel tank pit) were analyzed for TPH as gasoline, TPH as diesel, and BTEX. The water sample was also analyzed for organic lead by the California LUFT Manual procedure. The results of the soil analyses are summarized in Tables 5 and 6. The results of the water analyses are summarized in Table 7.

Based upon the analytical results of the soil samples collected through October 1992, it appeared that the majority of the known hydrocarbon-impacted soil had been excavated and removed in the vicinity of the pump islands, the product piping trenches, the waste oil tank pit, and the western portion of the fuel tank pit. Hydrocarbon-impacted soil was also excavated and removed from the eastern portion of the fuel tank pit to a depth of 22 feet below grade, where ground water was encountered. Free product and a heavy sheen was detected on the ground water within the eastern

portion of the tank pit. As previously stated, the eastern end of the super unleaded tank was observed to contain a nine-inch long crack during the removal of this tank.

Therefore, based on the analytical results of the soil and ground water samples collected through October 1992, and in accordance with the guidelines established by the Regional Water Quality Control Board (RWQCB), KEI concluded that further work was warranted at the site because of the levels of contamination found in the soil and water samples collected from the eastern portion of the fuel tank pit. To comply with the requirements of the RWQCB and the SMCDHS, KEI recommended the installation of three monitoring wells at the site in order to begin to define the extent of the soil and ground water contamination, and to determine the ground water flow direction.

On May 24 and 25, 1994, three two-inch diameter monitoring wells (designated as MW1 through MW3 on the attached Figure 1) were installed at the site. The three wells were each drilled and completed to total depths ranging from 28 to 30 feet below grade. Ground water was encountered at depths ranging from 17.5 to 20 feet below grade during drilling.

The new wells (MW1 through MW3) were developed on June 9 and 10, 1994, and were initially monitored and sampled on June 15, 1994.

Water and selected soil samples from the borings of MW1 through MW3 were analyzed at Sequoia Analytical Laboratory. The samples were analyzed for TPH as gasoline by EPA method 5030/modified 8015, and BTEX by EPA method 8020. The results of the soil analyses are summarized in Table 4, and the results of the water analyses are summarized in Table 3.

Based upon the analytical results of the soil and ground water samples collected and evaluated through June 1994, KEI concluded that the area of hydrocarbon-impacted soil and ground water on-site appeared to be limited to the vicinity of the underground fuel storage tanks. In addition, based upon the analytical results of the soil and ground water samples collected from wells MW2 and MW3, KEI concluded that the extent of hydrocarbon contamination in the vicinity of the underground fuel storage tanks had not been delineated. However, before making recommendations pertaining to additional exploratory borings/monitoring wells or evaluation of potential remedial options, KEI recommended the implementation of a three month ground water monitoring and sampling program. The purpose of this three month program was to attempt to establish a consistent ground water flow direction and contaminant concentration levels at the site.

RECENT FIELD ACTIVITIES

On March 23, 1995, two additional two-inch diameter monitoring wells (designated as MW4 and MW5 on the attached Figure 1) were installed in the vicinity of the subject site. The wells were each drilled, constructed, and completed in accordance with the guidelines of the Regional Water Quality Control Board (RWQCB) and the California Well Standards (per Bulletin 74-90). The subsurface materials penetrated and details of the construction of the wells are described in the attached Boring Logs and Well Construction Diagrams, respectively.

The two wells (MW4 and MW5) were each drilled and completed to a total depth of 27 feet below grade. During drilling, ground water was encountered at a depth of 10.5 feet below grade in MW4, and at a depth of 12 feet below grade in MW5. Soil samples were collected for laboratory analysis and for lithologic logging purposes at a maximum spacing of 5 foot intervals, at significant changes in lithology, at obvious areas of contamination, and at or immediately below the soil/ground water interface, beginning at a depth of approximately 5 feet below grade and continuing until ground water was encountered. All other soil sampling conducted below the ground water table was for lithologic logging purposes only. The undisturbed soil samples were collected by driving a California-modified split-spoon sampler (lined with brass liners) ahead of the drilling augers. The two-inch diameter brass liners holding the samples were sealed with Teflon-lined plastic caps, labeled, and placed in individually sealed plastic bags, which were then stored in a cooler, on ice, until delivery to a state-certified laboratory.

Each well casing was installed with a watertight cap and a padlock. A round, watertight, flush-mounted well cover was cemented in place over each well casing. The top of each well casing was surveyed by Kier & Wright of Pleasanton, California, to Mean Sea Level (MSL) and to a vertical accuracy of 0.01 foot.

The new wells were developed on April 4, 1995. Prior to development, the wells were checked for the depth to the water table and the presence of free product. No free product was noted in either of the two wells. After recording the monitoring data, the two new wells were each purged (by the use of a pump) of 110 gallons of water until the evacuated water was clear and free of visible suspended sediment.

All of the wells, including the newly installed wells MW4 and MW5, were monitored and sampled on April 7, 1995, by MPDS Services, Inc., of Concord, California. The monitoring and well development data are summarized in Table 1, and the field parameter data are summarized in Table 2.

ANALYTICAL RESULTS

Selected soil samples collected from the boring of monitoring wells MW4 and MW5 were analyzed at Sequoia Analytical Laboratory. All samples analyzed were accompanied by properly executed Chain of Custody documentation. The samples were analyzed for TPH as gasoline by EPA method 5030/modified 8015, and BTEX by EPA method 8020. The analytical results of the soil samples are summarized in Table 4. Copies of the laboratory analyses and the Chain of Custody documentation for the soil samples are attached to this report.

The analytical results of the ground water samples collected from all of the monitoring wells (MW1 through MW5) on April 7, 1995, are summarized in Table 3. The concentrations of TPH as gasoline and benzene detected in ground water samples collected on April 7, 1995, are shown on the attached Figure 2. Copies of the laboratory analyses and the Chain of Custody documentation for the water samples are attached to MPDS Services, Inc. Quarterly Data Report (MPDS-UN6390-03) dated May 5, 1995.

HYDROLOGY AND GEOLOGY

On April 7, 1995, the measured depth to ground water in the monitoring wells ranged from 9.11 to 10.47 feet below the top of the well casings. The ground water flow direction appeared to be to the east, as shown on the attached Figure 1. The hydraulic gradient at the site on April 7, 1995, was approximately 0.003, based on water level data collected from the monitoring wells prior to purging.

Based on review of regional geologic maps (U.S. Geological Survey Professional Paper 943, "Flatland Deposits of the San Francisco Bay Region, California, Their Geology and Engineering Properties, and Their Importance to Comprehensive Planning," by E.J. Helley and K.R. Lajoie, et. al., 1979), the subject site is underlain directly by Holocene medium-grained alluvium (Qham), which is described as typically consisting of unconsolidated, well-bedded, moderately sorted, moderately permeable fine sand, silt, and clayey silt, with occasional thin beds of coarse sand. The thickness of these deposits generally does not exceed 12 feet. The site is also located closely adjacent to mapped geologic contacts of older Holocene coarse-grained alluvium (Qhac) and late Pleistocene

alluvium (Qpa). The older Qhac sequence is described as consisting of well bedded, unconsolidated, moderately sorted, permeable sand and silt, locally interbedded with coarse sand and gravel. The maximum thickness of this alluvial sequence is estimated at 50 feet. The Qpa deposits, the oldest of the sediments listed here, consist of weakly consolidated, slightly weathered, poorly sorted and irregularly interbedded clay, silt, sand, and gravel. The maximum thickness of the Qpa alluvial sequence is unknown, but is estimated to be at least 150 feet.

Based on the results of our subsurface studies, the subject site and vicinity are underlain by fill materials to a depth of about 2 feet below grade. The fill is in turn underlain by alluvium to the maximum depth explored (30 feet below grade). The alluvium underlying the site consists predominantly of silty or clayey gravel and sandy or clayey silt. Lesser amounts of silty sand and silty clay are also present.

No. Does not jive. Likely <10 fbg.

As of March 1995, the unsaturated zone beneath the site is approximately 16 feet thick and consists of silty or clayey gravel and sandy or clayey silt. The first water bearing unit beneath the site (first aquifer) consists largely of gravel. Subordinate amounts of silt and sand were also encountered during drilling.

The results of the particle size analysis (sieve and hydrometer) previously conducted on the soil sample collected from the boring for monitoring well MW1 at a depth of 22.5 feet below grade indicated that the sample was composed of approximately 49% sand, 31% gravel, 11% clay, and 9% silt. However, the lab reported that the sample subjected to particle size analysis contained organic material that did not pass the No. 4 sieve, and therefore the resulting determination of percent gravel may be artificially elevated. The sample was classified as a silty sand with gravel (SM).

DISTRIBUTION

Copies of this report should be sent to the SMCDHS, and to the RWQCB, San Francisco Bay Region.

LIMITATIONS

Soil deposits and rock formations may vary in thickness, lithology, saturation, strength and other properties across any site. In addition, environmental changes, either naturally-occurring or artificially-induced, may cause changes in the extent and concentration of any contaminants. Our studies assume that the field and laboratory data are reasonably representative of the site as a whole, and assume that subsurface conditions are reasonably conducive to interpolation and extrapolation.

The results of this study are based on the data obtained from the field and laboratory analyses obtained from a state-certified laboratory. We have analyzed this data using what we believe to be currently applicable engineering techniques and principles in the Northern California region. We make no warranty, either expressed or implied, regarding the above, including laboratory analyses, except that our services have been performed in accordance with generally accepted professional principles and practices existing for such work.

Should you have any questions regarding this report, please do not hesitate to call me at (510) 602-5100.

Sincerely,

Kaprealian Engineering, Inc.

Haig (Gary) Tejirian

Please Note:
The LCS is a control sample of known, interferent free matrix that is analyzed using the same reagents, preparation, and analytical methods employed for the samples. The matrix spike is an aliquot of sample fortified with known quantities of specific compounds and subjected to the entire analytical procedure. If the recovery of analytes from the matrix spike does not fall within specified control limits due to matrix interference, the LCS recovery is to be used to validate the batch.

Mr. Syed Rizvi
Unocal Corporation
Post Office Box 2390
Brea, California 92622-2390

Subject: Oil/Water Separator Abandonment at Unocal Service Station No. 6390, 402 South Delaware Street, San Mateo, California.

Mr. Rizvi:

This report was prepared by GeoStrategies (GSI) and summarizes field activities and chemical analytical data associated with the abandonment of an oil/water separator performed in January 1996 at the above referenced site. Excavation and abandonment work described in this report was performed by Gettler-Ryan Inc. (G-R) of Dublin, California. Field work was performed to comply with Regional Water Quality Control Board (RWQCB) - San Francisco Bay Region and San Mateo County Department of Health Services (SMCDHS) guidelines.

FIELD PROCEDURES

The site is occupied by an Unocal Service Station with five pump islands, an underground storage tank complex, and a station building with two repair bays. Currently the station is being reconstructed. The 2.0 by 4.0 by 2.5-foot deep oil/water separator is located in the southern repair bay as shown on Figure 1.

G-R bailed the contents of the separator into a 55-gallon steel drum. The separator and the lube bay drain pipes were steam cleaned, the rinsate bailed into drums, and the inside surfaces of the separator wiped dry with absorbent pads. The concrete bottom of the separator was then broken out with a jackhammer to allow for collection of a soil sample.

Soil Sampling

Soil sample OWS-S-4.5 was collected by a GSI geologist on January 12, 1996, from beneath the oil/water separator. Ms. Sabrina Mih of the SMCDHS was present at the site to observe sample collection. A hand auger was used to remove soil from beneath the concrete bottom of the inflow box. The soil beneath the separator consisted of orange brown silty sand. A hand-driven soil sampler, fitted with a stainless steel sample tube, was used to collect the soil sample. Soil sample OWS-S-4.5 was collected at a depth of approximately 4.5 feet below ground surface. The sample location is shown on Figure 1. After removing the sample from the sampling device, both ends were covered with teflon sheeting and sealed with plastic end caps. The sample was then labelled, placed in a cooler with blue ice, entered on a chain-of-custody form, and transported to McCampbell Analytical Inc. (McCampbell), a State-certified environmental laboratory located in Pacheco, California (ELAP # 1644).

Backfilling

After receiving laboratory analytical results for the soil sample, G-R backfilled the former oil/water separator with clean base rock to approximately four inches below ground surface. Concrete was then placed on top of the base rock in the separator and in the drain pipes, and finished even with the lube bay floor.

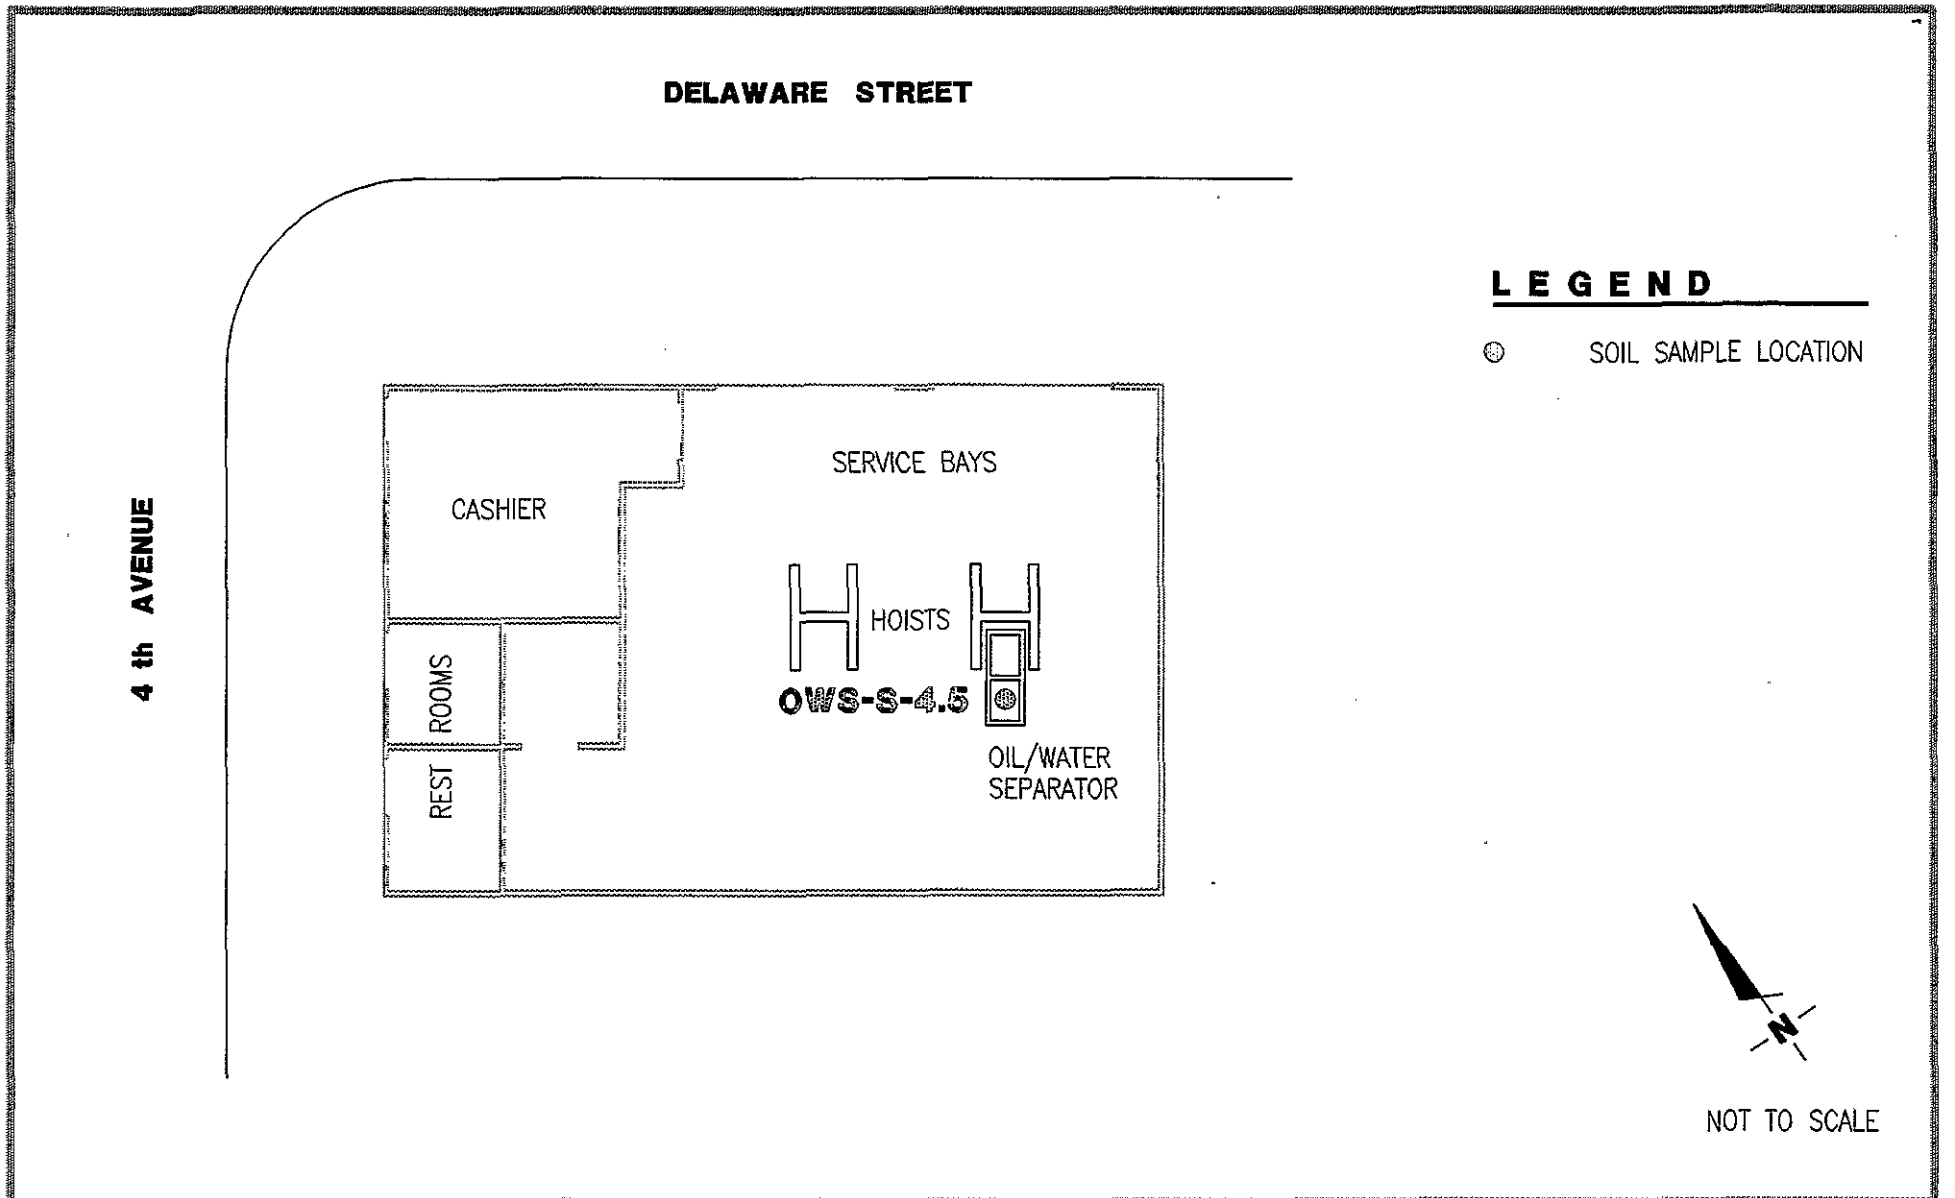
Waste Disposal

Liquid and solid wastes generated during the oil/water separator cleaning and abandonment were disposed by H & H Environmental Services of San Francisco, California. Waste manifest is presented in Attachment A.

ANALYSIS AND RESULTS

Soil sample OWS-S-4.5 was analyzed for total petroleum hydrocarbons as gasoline (TPHg) and gasoline constituents benzene, toluene, ethylbenzene and xylenes (BTEX) using Environmental Protection Agency (EPA) Methods 5030/modified 8015/8020; total petroleum hydrocarbons as diesel (TPHd) using EPA Methods modified 8015/3550; oil and grease (O&G) using

Standard Method (SM) 5520 D/E&F; chlorinated hydrocarbons (Cl-HCs) using EPA Method 8010; and the metals cadmium, chromium, nickel, lead and zinc using EPA Methods 6010/200.7.



Laboratory analytical results for soil sample OWS-S-4.5 indicated nondetectable concentrations of TPHg, benzene, ethylbenzene, O&G, VOCs and cadmium. Toluene, xylenes and TPHd were detected in this sample at concentrations of 0.006 parts per million (ppm), 0.009 ppm, and 1.5 ppm, respectively. Chromium, lead, nickel and zinc were detected at concentrations of 160 ppm, 12 ppm, 99 ppm and 69 ppm, respectively. These metal concentrations are below their respective current Total Threshold Limit Concentrations (TTLCs) as presented in Title 22 of the California Code of Regulations. The McCampbell chemical analytical report and completed chain-of-custody form are presented in Attachment B.

If you have questions, please call us at (510) 551-8777.

Tele: 510-798-1620 Fax: 510-798-1622

01/19/96

Dear Barbara:

Enclosed are:

1). the results of **1** samples from your **Unocal SS # 6390; Job # 2000.01** project,

2). a QC report for the above samples

3). a copy of the chain of custody, and

4). a bill for analytical services.

If you have any questions please contact me. McCampbell Analytical Laboratories strives for excellence in quality, service and cost. Thank you for your business and I look forward to working with you again.

Yours truly,

Edward Hamilton

Attention: Mr. David J. Camille

RE: Continuing Subsurface Investigation at
Unocal Service Station #6390
402 So. Delaware Street
San Mateo, California

Dear Mr. Camille:

This report presents the results of Kaprealian Engineering, Inc's. (KEI) most recent subsurface investigation at the referenced site, in accordance with KEI's proposal (KEI-P92-0801.P4) dated August 10, 1995. The purpose of the investigation was to further determine the extent of the dissolved hydrocarbon plume in the ground water in the vicinity of the site. The scope of the work performed by KEI consisted of the following:

Coordination with regulatory agencies

Installation of three GeoProbe ground water sample points

Ground water sampling

Delivery of ground water samples (including properly executed Chain of Custody documentation) to a California-certified analytical laboratory for laboratory analyses

Data analyses, interpretation, and report preparation

SITE DESCRIPTION AND BACKGROUND

The subject site contains an operating Unocal service station facility, and is located on the southwest corner of the intersection of 4th Avenue and South Delaware Street in San Mateo, California. The site occupies flat terrain and is situated approximately one mile from the present day shoreline of San Francisco Bay. A Location Map is attached to this report. Detailed background information and hydrogeologic conditions are presented in KEI's report (KEI-P92-0801.R5) dated May 11, 1995. The most recent and historical ground water analytical results are presented in MPDS Services, Inc's. Quarterly Data Report (MPDS-UN6390-03) dated January 16, 1996.

2401 Stanwell Drive, Suite 400
Concord, California 94520
Tel: 510.602.5100 Fax: 510.687.0602

RECENT FIELD ACTIVITIES

On February 14, 1996, three ground water sample points (designated as SP1, SP2, and SP4 on the attached Figure 1) were installed in the vicinity of the subject site.

The three ground water sample points were completed by the use of a GeoProbe small diameter, hydraulically-driven drill rig. The sample points were completed to a total depth of 13 feet below grade. During drilling, ground water was encountered at a depth of approximately 10.5 feet below grade at each sample point. Soil samples were not collected during drilling.

Sample point SP3 was abandoned after three attempts due to the presence of underground utilities. Sample point SP5 was not installed after the field screening of samples collected from SP1 and SP2 indicated non-detectable levels of hydrocarbons.

After the water samples were collected, neat cement was used to seal the borings. Neat cement was placed from the bottom of each boring to the surface in one continuous pour by the use of a tremie pipe. A hardening agent was used for the upper 1 to 2 feet of the borings to reduce curing time.

ANALYTICAL RESULTS

All ground water samples were analyzed at Sequoia Analytical Laboratory in Walnut Creek, California, and were accompanied by properly executed Chain of Custody documentation. Water samples from SP1, SP2, and SP4 were analyzed for total petroleum hydrocarbons (TPH) as gasoline by EPA method 5030/modified 8015, and benzene, toluene, ethylbenzene, and xylenes by EPA method 8020.

The results of the water analyses are summarized in Table 1. Copies of the laboratory analyses and the Chain of Custody documentation are attached to this report.

HYDROLOGY

During recent drilling activities, ground water was encountered in exploratory borings SP1, SP2, and SP4 at a depth of approximately 10.5 feet below the surface.

DISCUSSION

Based on the analytical results of the ground water samples collected during the most recent study, it appears that ground water in the area southwest of the vicinity of the site (SP1 and

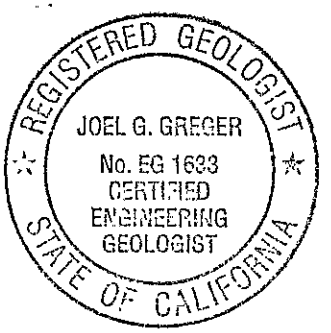
SP2) has not been impacted by hydrocarbons. However, the sample taken from SP4 contained relatively low levels of dissolved-phase hydrocarbons. The source of these hydrocarbons is unclear due to the proximity of Jiffy Lube (former Shell station), where a separate ground water investigation is being conducted.

DISTRIBUTION

A copy of this report should be sent to the San Mateo County Department of Health Services, and to the Regional Water Quality Control Board, San Francisco Bay Region.

LIMITATIONS

Soil deposits and rock formations may vary in thickness, lithology, saturation, strength and other properties across any site. In addition, environmental changes, either naturally-occurring or artificially-induced, may cause changes in ground water levels and flow paths, thereby changing the extent and concentration of any contaminants. Our studies assume that the field and laboratory data are reasonably representative of the site as a whole, and assume that subsurface conditions are reasonably conducive to interpolation and extrapolation.



The results of this study are based on the data obtained from the field and laboratory analyses obtained from a state-certified laboratory. We have analyzed this data using what we believe to be currently applicable engineering techniques and principles in the Northern California region. We make no warranty, either expressed or implied, regarding the above, including laboratory analyses, except that our services have been performed in accordance with generally accepted professional principles and practices existing for such work.

Should you have any questions on this report, please call me at (510) 602-5100.

Sincerely,

Kaprealian Engineering, Inc.

Thomas E. Seeliger

Please Note:
The LCS is a control sample of known, interferent free matrix that is analyzed using the same reagents, preparation, and analytical methods employed for the samples. The matrix spike is an aliquot of sample fortified with known quantities of specific compounds and subjected to the entire analytical procedure. If the recovery of analytes from the matrix spike does not fall within specified control limits due to matrix interference, the LCS recovery is to be used to validate the batch.

Project Manager

Please Note:
The LCS is a control sample of known, interferent free matrix that is analyzed using the same reagents, preparation, and analytical methods employed for the samples. The matrix spike is an aliquot of sample fortified with known quantities of specific compounds and subjected to the entire analytical procedure. If the recovery of analytes from the matrix spike does not fall within specified control limits due to matrix interference, the LCS recovery is to be used to validate the batch.

RE: Soil Sampling Report
Unocal Service Station #6390
402 South Delaware Street
San Mateo, California

Dear Mr. Howard:

This report summarizes the soil sampling performed by Kaprealian Engineering, Inc. (KEI) at the referenced site. All work was performed in compliance with the guidelines established by the Regional Water Quality Control Board (RWQCB) and the San Mateo County Department of Health Services (SMCDHS).

The scope of the work performed by KEI consisted of the following:

Coordination with regulatory agencies

Collection of soil samples from beneath the fuel and waste oil storage tanks, from the sidewalls of the fuel tank pit excavation, and from beneath the product pipe trenches and dispensers

Collection of one ground water sample from the fuel storage tank pit

Delivery of soil and water samples, including proper Chain of Custody documentation, to a certified analytical laboratory

Technical review and preparation of this report

SITE DESCRIPTION AND BACKGROUND

The subject site contains a Unocal service station facility. A Location Map and a Site Plan are attached to this report. No previous subsurface work performed at the site is known to KEI.

2401 Stanwell Drive, Suite 400
Concord, California 94520
Tel: 510.602.5100 Fax: 510.687.0602

FIELD ACTIVITIES

KEI's initial field work was conducted on August 5, 1992, when one 12,000 gallon regular unleaded gasoline storage tank and one 12,000 gallon super unleaded gasoline storage tank were removed from the site. The tanks were made of fiberglass, and no apparent holes or cracks were observed in the regular unleaded gasoline tank. However, the super unleaded gasoline tank had a nine-inch long crack located near the east end of the tank. Tank removal and soil sampling were performed in the presence of Ms. Sabrina Mih of the SMCDHS. Mr. Jorge Gomar of the SMCDHS was also present during tank removal.

Two soil samples, labeled A1 and B1, were collected from beneath the west ends of the fuel tanks at depths of about 15 feet below grade. Two soil samples, labeled A2(22) and B2(18), were collected from beneath the east ends of the fuel tanks at depths of approximately 22 feet and 18 feet below grade, respectively. Due to obvious soil contamination observed beneath the east ends of the fuel tanks and per the request of Ms. Mih, two soil samples, labeled SW1 and SW2, were collected from the south and east sidewalls of the fuel tank pit at depths of approximately 15 feet below grade. The undisturbed soil samples were collected from bulk material excavated by backhoe. Soil samples were placed in clean, two-inch diameter brass tubes, sealed with aluminum foil, plastic caps and tape, labeled, and then stored in a cooled ice chest for delivery to a state-certified laboratory. Sample point locations are as shown on the attached Site Plan.

KEI returned to the site on August 11, 1992, when one 550 gallon waste oil storage tank was removed from the site. The tank was made of steel, and two holes of 3/16 inch in diameter were observed in the tank. Mr. Gomar was present during tank removal. One soil sample, labeled WO1, was collected from beneath the waste oil tank at a depth of about 8 feet below grade. In addition, six soil samples, labeled P1 through P6, were collected from beneath the product pipe trenches at depths of approximately 3 feet below grade. The samples were collected and handled as previously described. Sample point locations are as shown on the attached Site Plan. Soil sampling was performed in the presence of Ms. Mih.

On August 21, 1992, the east side of the fuel tank pit was additionally excavated to a depth of approximately 22 feet below grade (over an area of about 30 feet by 27 feet). Ground water was observed at a depth of about 21 feet below grade. In an attempt to define the extent of existing soil contamination in the vicinity of the sidewalls, three additional soil samples, labeled SW1(2.5), SW2(2.5), and SW3, were collected from the sidewalls of the additionally excavated fuel tank pit at depths of approximately 16

likely ~21

feet below grade. The samples were also collected from bulk material excavated by backhoe and handled as described above. Ms. Mih was present during excavation and soil sampling activities. Sample point locations are shown on the attached Site Plan. Excavated soil was stockpiled on-site and sampled prior to disposal. After the soil sampling was completed, approximately 1,000 gallons of contaminated ground water (with floating product and heavy sheen) were pumped from the fuel tank pit.

On August 25, 1992, an additional 4,800 gallons of ground water were pumped from the fuel tank pit. One water sample, labeled W1, was then collected from the fuel tank pit in four clean glass VOA vials and one-liter amber bottles. The water sample was also stored as described above.

KEI returned to the site on October 22, 1992, in order to collect soil samples from beneath the former product dispensers prior to the new piping installation. Three soil samples, labeled D1, D2, and D3, were collected at depths of about 7 feet below grade. These samples were also collected and handled as previously described. Sample point locations are shown on the attached Site Plan.

SUBSURFACE CONDITIONS

The subsurface soils exposed in the excavations consisted primarily of clayey silt to the maximum depth explored (approximately 22 feet below grade). However, the subsurface soils exposed in the waste oil tank pit excavation consisted primarily of silt with some gravel. Ground water was encountered in the fuel tank pit at a depth of about 21 feet below grade. likely <21 fbg

ANALYTICAL RESULTS

All samples were analyzed by Sequoia Analytical Laboratory in Concord, California, and were accompanied by properly executed Chain of Custody documentation. Samples from the fuel tank pit were analyzed for total petroleum hydrocarbons (TPH) as gasoline by EPA method 5030/modified 8015, and benzene, toluene, xylenes, and ethylbenzene (BTX&E) by EPA method 8020. The sample from the waste oil tank pit was analyzed for TPH as gasoline, TPH as diesel by EPA method 3550/modified 8015, BTX&E, total oil and grease (TOG) by Standard Methods 5520E&F, EPA method 8010 constituents, and the metals cadmium, chromium, lead, nickel, and zinc. The sidewall soil sample SW3 and the water sample W1 (collected from the fuel tank pit) were analyzed for TPH as gasoline, TPH as diesel, and BTX&E. The water sample was also analyzed for organic lead by the California Luft Manual procedure.

The analytical results of the soil samples (A1 and B1) collected from beneath the west end of the fuel tank pit excavation indicated concentrations of TPH as gasoline at 33 ppm and 20 ppm, respectively. Samples A2 and B2, collected from beneath the east end of the fuel tank pit excavation, showed concentrations of TPH as gasoline at 480 ppm and 5,000 ppm, respectively. The analytical results of the initial soil samples (SW1 and SW2) collected from the sidewalls of the fuel tank pit indicated concentrations of TPH as gasoline at 980 ppm and 1,100 ppm, respectively. However, following the additional 2.5 feet lateral excavation of the fuel tank pit sidewalls, the additional sidewall soil samples showed concentrations of TPH as gasoline ranging from non-detectable to 16 ppm. TPH as diesel was detected in sample SW3 at a concentration of 5.9 ppm.

The analytical results of the soil samples collected from beneath the product dispensers and piping trenches indicated non-detectable concentrations of TPH as gasoline and BTX&E.

The analytical results of the soil sample collected from beneath the waste oil tank showed non-detectable concentrations of TPH as gasoline, TPH as diesel, BTX&E, TOG, and all EPA method 8010 constituents, except for tetrachloroethene, which was detected at a concentration of 6.4 ppb. The results of the soil analyses are summarized in Tables 1 and 2. The analytical results of the water sample (W1) collected from the fuel tank pit (after purging a total of 5,800 gallons of ground water) indicated concentrations of TPH as gasoline and TPH as diesel at 50,000 ppb and 28,000 ppb, respectively, and benzene at 1,200 ppb. The results of the water analyses are summarized in Table 3. Copies of the laboratory analyses and the Chain of Custody documentation are attached to this report.

DISCUSSION AND RECOMMENDATIONS

Based upon the analytical results of the soil samples collected to date, it appears that the majority of the contaminated soil has been excavated and removed in the vicinity of the pump islands, the product piping trenches, the waste oil tank pit, and the western portion of the fuel tank pit. Contaminated soil was also excavated and removed in the eastern portion of the fuel tank pit to a depth of 22 feet below grade, where ground water was encountered. Free product and a heavy sheen was detected on the ground water within the eastern portion of the tank pit. The eastern end of the super unleaded tank was observed to contain a nine-inch long crack during the removal of this tank.

Therefore, based on the analytical results of the soil and ground water samples collected to date, and in accordance with the

guidelines established by the RWQCB, further work is warranted at the site because of the levels of contamination found in the soil and water samples collected from the eastern portion of the fuel tank pit. To comply with the requirements of the RWQCB and the SMCDHS, KEI recommends the installation of three monitoring wells at the site in order to begin to define the extent of the soil and ground water contamination, and to determine the ground water flow direction. Our work plan/proposal for this work is attached for your review and consideration.

DISTRIBUTION

A copy of this report should be sent to Ms. Sabrina Mih of the SMCDHS, and to the RWQCB, San Francisco Bay Region.

LIMITATIONS

Soil deposits and rock formations may vary in thickness, lithology, saturation, strength and other properties across any site. In addition, environmental changes, either naturally-occurring or artificially-induced, may cause changes in the extent and concentration of any contaminants. Our studies assume that the field and laboratory data are reasonably representative of the site as a whole, and assume that subsurface conditions are reasonably conducive to interpolation and extrapolation.

The results of this study are based on the data obtained from the field and laboratory analyses obtained from a state-certified laboratory. We have analyzed this data using what we believe to be currently applicable engineering techniques and principles in the Northern California region. We make no warranty, either expressed or implied, regarding the above, including laboratory analyses, except that our services have been performed in accordance with generally accepted professional principles and practices existing for such work.

Should you have any questions regarding this report, please feel free to call at (510) 602-5100.

Sincerely,

Kaprealian Engineering, Inc.

The following MUST BE completed by the laboratory accepting samples for analysis:

1. Have all samples received for analysis been stored in ice? ✓
2. Will samples remain refrigerated until analyzed? ✓
3. Did any samples received for analysis have head space? No
4. Were samples in appropriate containers and properly packaged? ✓

1.0 INTRODUCTION

This report has been prepared by SECOR International, Inc. (SECOR) on behalf of the ConocoPhillips Company (ConocoPhillips) for a site assessment to evaluate the extent of petroleum hydrocarbons adsorbed to soil, dissolved-phase petroleum hydrocarbons in groundwater, and petroleum hydrocarbon vapor in subsurface soil at the property located at 402 South Delaware Street, San Mateo, California (the "Site"). SECOR submitted a work plan on December 5, 2005 to the San Mateo County Health Department – Groundwater Protection Program (SMCHD-GPP) addressing further assessment of the lateral and vertical extent of hydrocarbon-affected groundwater north, southeast, and south of the fuel UST cavity, and the potential vapor inhalation risk from hydrocarbon-affected groundwater in the southern half of the site. The SMCHD-GPP requested a revised work plan in their letter dated May 1, 2006 (Appendix A). SECOR submitted a *Revised Work Plan for Additional Site Assessment* on June 22, 2006. This revised work plan was conditionally approved by the SMCHD-GPP in their letter dated October 18, 2006 (Appendix A).

2.0 SITE BACKGROUND

2.1 Site Location

The 76 branded Service Station property (the "site") is located at 402 South Delaware Street, on the south corner of South Delaware Street and East Fourth Avenue in the City of San Mateo, San Mateo County, California (Figure 1). The site is bordered by South Delaware Street to the northeast, East Fourth Avenue to the northwest, and commercial buildings to the southwest and southeast. There are two active gasoline service stations located in the near vicinity: a Shell station on the north corner of East Third Avenue and South Delaware Street, and an ARCO station on the south corner of East Third Avenue and South Delaware Street. Historically, there used to be a Shell service station directly across South Delaware Street from the site on the east corner of South Delaware Street and East Fourth Avenue; a Jiffy Lube now exists at this location. Additionally, a former 76 branded service station was located on the west corner of East Third Avenue and El Dorado Street.

The site is an active service station dispensing 76 branded gasoline. The property is owned by Lucile G. Benedetti, whose contact information has been supplied to the SMCHD-GPP under separate cover. The station facilities include two unleaded gasoline underground storage tanks (USTs) located in a common pit in the southeast portion of the property, three product dispenser islands, and a station building (Figure 2). The USTs were installed at the site in August 1992 during station upgrade activities. A 550-gallon waste oil UST formerly located behind the station building was removed from the site when the current gasoline USTs were installed.

2.2 Site History

In August 1992, Kaprealian Engineering, Inc. (KEI) observed the removal of two 12,000-gallon capacity, fiberglass, gasoline underground storage tanks (USTs), one 505-gallon waste oil UST, and the associated product piping and dispensers. A 9-inch long crack was observed along the eastern end of the super unleaded gasoline UST upon removal. Subsequent petroleum hydrocarbon contamination was observed at the eastern end of the gasoline UST cavity. The cavity was over-excavated to remove as much of the impacted soil as possible, resulting in a final excavation that measured approximately 30 feet long by 27 feet wide by 22 feet deep. Initially, six soil samples were collected (A1, A2, B1, B2, SW1, and SW2) from the bottom and sidewalls of the UST cavity, one soil sample (WO1) was collected from the bottom of the waste oil UST cavity, and six soil samples (P1, P2, P3, P4, P5, and P6) were collected from the bottom of the product piping trenches. KEI returned at a later date to collect an additional three samples (SW1(2.5), SW2(2.5), and SW3) from the gasoline UST cavity and a grab water sample (W1). The water sample was collected after a total of approximately 5,800 gallons of water had been pumped form the gasoline UST cavity. The groundwater was observed to have floating product and a heavy sheen. Additionally, KEI collected three soil samples (D1, D2 , and D3) from beneath the gasoline dispensers. Laboratory analysis of soil samples collected from the gasoline UST cavity indicated the presence of up to 5,000 milligrams per kilogram (mg/kg) total petroleum hydrocarbons as gasoline (TPHg, B2), 47 mg/kg benzene (B2), 470 mg/kg toluene (B2), 120 mg/kg ethyl-benzene (B2), 790 mg/kg total xylenes (B2), and 5.9 mg/kg total petroleum hydrocarbons as diesel (TPHd, SW3). The requested petroleum hydrocarbon

constituents were not reported above laboratory detection limits in the soil samples collected from the product piping trenches and from beneath the gasoline dispensers. Laboratory analysis of the soil sample from the waste oil UST indicated the presence of the heavy metals cadmium, chromium, nickel, lead and zinc at concentrations of 1.1 mg/kg, 67 mg/kg, 73 mg/kg, 6.0 mg/kg, and 44 mg/kg, respectively, while the remaining petroleum hydrocarbon constituents were not indicated at concentrations above the laboratory detection limits. Analysis of the water sample collected from the gasoline UST indicated 28,000 micrograms per liter (µg/L) TPHd, 50,000 µg/L TPHg, 1,200 µg/L benzene, 6,700 µg/L toluene, 1,400 µg/L ethyl-benzene, and 10,000 µg/L total xylenes. Laboratory results are included in Table 1 (KEI, 1992).

In May 1994, KEI installed three monitoring wells (MW-1, MW-2 and MW-3) at the site (Figure 2). Laboratory analysis of the soil samples collected from the borings for monitoring wells MW-2 and MW-3 indicated the presence of TPHg and benzene, toluene, ethyl-benzene, and total xylenes (BTEX) at maximum concentrations of 2,600 mg/kg TPHg (MW2 at 17'), 26 mg/kg benzene (MW2 at 15'), 240 mg/kg toluene (MW2 at 15'), 62 mg/kg ethylbenzene (MW2 at 17'), and 410 mg/kg total xylenes (MW2 at 17'). The requested petroleum hydrocarbon constituents were not reported above laboratory detection limits in the soil samples collected form the MW-1 borehole. The wells were initially monitored and sampled in June 1994. Laboratory analysis of the water samples collected indicated the presence of petroleum hydrocarbons in MW-2 and MW-3, with maximum concentrations of 89,000 µg/L TPHg, 11,000 µg/L benzene, 37,000 µg/L toluene, 3,000 µg/L ethyl-benzene, and 20,000 µg/L total xylenes reported in MW-2. The depth to water ranged from 15.33 to 16.71 feet below ground surface (bgs), with the evaluated groundwater gradient being approximately 0.004 foot/foot to the east. KEI concluded to follow a three month monitoring program, at which point the wells would be re-sampled. Laboratory results are included in Tables 1 and 2 (KEI, 1994).

In March 1995, two additional monitoring wells (MW-4 and MW-5) were installed in offsite locations in the sidewalk along the opposite side of South Delaware Street form the site (Figure 2). The offsite wells were located in the downgradient direction from the site. Laboratory analysis of the soil samples collected from the monitoring well boreholes indicated the presence of TPHg and BTEX at maximum concentrations of 600 mg/kg TPHg, 3.3 mg/kg benzene, 38 mg/kg toluene, 14 mg/kg ethylbenzene, and 96 mg/kg total xylenes in soil sample MW4 at 5'. The new wells were added to the quarterly groundwater monitoring and sampling program, and were first sampled in April 1995. Laboratory analysis of the water samples collected from MW4 and MW5 indicated the presence of maximum concentrations of 150,000 µg/L TPHg, 12,000 µg/L benzene, 40,000 µg/L toluene, 4,700 µg/L ethyl-benzene, and 31,000 µg/L total xylenes reported in MW-4. Laboratory results are included in Tables 1 and 2 (KEI, 1995).

In January 1996, GeoStrategies (GSI) observed the excavation and removal of a 150 gallon capacity oil/water separator. A confirmation soil sample (OWS-S-4.5) was collected from underneath the oil/water separator at a depth of 4.5 feet bgs. Laboratory analysis of the sample indicated the presence of trace concentrations of TPHd, toluene, and total xylenes at 1.5 mg/kg, 0.006 mg/kg, and 0.009 mg/kg, respectively. Additionally, the presence of the heavy metals chromium, nickel, lead, and zinc were indicated at concentrations of 160 mg/kg, 99 mg/kg, 13 mg/kg, and 69 mg/kg, respectively. The remaining requested petroleum hydrocarbon constituents were not reported above laboratory detection limits. Laboratory results are included in Table 1 (GSI, 1996).

In February 1996, KEI supervised the advancement of three Geoprobe® soil borings (SP1, SP2, and SP4) at offsite locations (Figure 2). The soil borings were terminated at a depth of 13 feet bgs, with groundwater encountered at approximately 10.5 feet bgs. Grab water samples were collected from each borehole. Laboratory analysis of the water samples indicated the presence of TPHg, benzene, ethylbenzene, and total xylenes in the sample from boring SP-4 at concentrations of 450 µg/L, 71 µg/L, 6.7 µg/L, and 17 µg/L, respectively. The requested petroleum hydrocarbon constituents were not reported above laboratory detection limits in the groundwater samples from borings SP-1 and SP-2. A summary of laboratory results is included in Table 2 (KEI, 1996).

The site has been monitored and sampled since the second quarter 1994. From 1994 to 2000, the site was monitored on a quarterly basis. Since 2001, the frequency has been reduced to semi-annual monitoring and sampling. Historically, the highest dissolved phase petroleum hydrocarbon concentrations have occurred in wells MW-2 and MW-3. The groundwater gradient has been mainly to the east and southeast (SECOR, 2006). Laboratory results are included in Table 2.

Historical soil and groundwater sampling locations are shown on Figure 2, and historical soil, groundwater, and gradient data are summarized in Tables 1 through 3 and Figure 3.

3.0 SCOPE OF WORK

On December 14 and 15, 2006, SECOR field staff observed Gregg Drilling and Testing, Incorporated (Gregg) of Martinez, California, advance four direct push soil borings (SP-5, SP-6 SP-7, and SP-8). On December 27, 2006, SECOR field staff observed Vironex of San Leandro, California, install three soil vapor wells (VP-1, VP-2, and VP-3) and one subslab soil vapor probe (SUBSLAB). From January 2 through 4, 2007, SECOR field staff observed Gregg install four groundwater monitoring wells (MW-6, MW-7, MW-8, and MW-9) and destroy four groundwater monitoring wells (MW-1, MW-2, MW-3, and MW-5) using hollow stem auger (HSA). On February 2, 2007, SECOR field staff observed Vironex reinstall the subslab soil vapor probe. The soil boring, monitoring well, and soil vapor well locations are illustrated on Figure 2. The completed scope of work is discussed below.

3.1 Site Health and Safety Plan

As required by the Occupational Health and Safety Administration Standard "Hazardous Waste Operations and Emergency Response" guidelines (29 CFR 1910.120), and by the California Occupational Health and Safety Administration "Hazardous Waste Operations and Emergency Response" guidelines (CCR Title 8, Section 5192), SECOR updated the current site-specific Health and Safety Plan (HASP) prior to the commencement of fieldwork. The HASP was reviewed by field staff and contractors before beginning field operations, and was in the possession of SECOR personnel while conducting work activities at the site.

3.2 Permitting

Prior to site assessment activities, SECOR applied for an encroachment permit from the City of San Mateo Department of Public Works (CSMDPW) for the advancement of soil borings SP-5, SP-6, SP-7, and SP-8, the destruction of monitoring well MW-5, and the installation of monitoring well MW-8. The CSMDPW encroachment permit was approved on December 14, 2006. SECOR also applied for subsurface drilling permits from the SMCHD-GPP, and these permits were granted on December 5, 2006. Copies of the permits are included in Appendix A.

3.3 Subsurface Utility Clearance

Prior to initiating field activities, SECOR marked the boring locations, contacted Underground Service Alert (USA) 48 hours prior to the initiation of field work, and contracted a private utility locator to investigate whether the proposed boring locations were clear of potential subsurface obstructions. Under the direction of SECOR field staff, the private utility locator identified an anomalous metallic signal in the vicinity of SP-6, and recommended moving the borehole either onsite, or into the second lane of traffic. The boring was moved onsite to prohibit the impedance of traffic on South Delaware Street. The private utility locator also identified an anomalous metallic signal in the vicinity of soil borings SP-5 and SP-7. The utility locator recommended moving SP-5 to the left northbound lane of South Delaware Street and recommended moving SP-7 to the center of East Fifth Avenue. SECOR discussed the new locations with traffic control, and both accepted the new location of the boreholes. The surface markings made by the utility companies contacted as member services of USA indicated that SECOR could not advance soil boring SP-8 and monitoring well MW-8 due to the presence of

subsurface utilities. SECOR instructed the private locator to determine the depth of the utility and the private locator determined the utility was marked incorrectly. SECOR contacted the USA member to remark the location. The USA member determined the utility was incorrectly marked the first time and correctly marked the utility. Soil boring SP-8 was in a location cleared for utilities. The location for monitoring well MW-8 was moved from the street to the sidewalk area which was cleared by both the private locator and the members of USA. The USA markings were corroborated by the private utility locator. The private utility locator did not identify potential subsurface obstructions at the locations for monitoring wells MW-6, MW-7, and MW-9, for soil vapor wells VP-1, VP-2, and VP-3, or the sub-slab vapor probe.

In order to decrease the chance of damaging an unidentified subsurface utility line, it is ConocoPhillips policy to use a pressurized air lance and vacuum to remove the top five feet of subsurface material. Soil borings SP-5 through SP-8 and MW-6 through MW-9 were cleared to a depth of 5 feet bgs using an air lance and vacuum truck prior to commencement of mechanical drilling. Additionally, the annulus materials surrounding wells MW-2 and MW-5 were cleared to a depth of 5 feet bgs.

The private utility locator identified electrical lines adjacent to groundwater monitoring wells MW-1 and MW-3. The distance between the lines and the monitoring wells was such that the wells could not be destroyed by over drilling, as stated in the work plan. These two wells were destroyed following the SMCEHD protocol for pressure grouting.

SECOR's field procedures are included in Appendix B.

3.4 Direct Push Soil Borings

On December 14 and 15, 2006, four soil borings (SP-5, SP-6, SP-7, and SP-8) were advanced. Soil boring SP-5 was advanced in the left northbound lane on South Delaware Street approximately 50 feet northwest of the intersection of South Delaware Street and East Fifth Avenue; soil boring SP-6 was advanced onsite approximately 12 feet northwest of the northeast dispenser island canopy; and soil borings SP-7 and SP-8 were advanced on East Fifth Avenue, approximately 88 feet southwest and approximately 87 feet northeast of the intersection of East Fifth Avenue and South Delaware Street, respectively (Figure 2).

The soil borings were advanced to depths of 28 feet bgs (SP-6), 30 feet bgs (SP-5 and SP-8), and 34 feet bgs (SP-7). Dual wall, direct push Geoprobe was utilized for soil boring SP-5 to a depth of 24 feet. Single wall, direct push Geoprobe casing was utilized for the remaining 6 feet in soil boring SP-5 and the total depths of soil borings SP-6, SP-7 and SP-8, because a possible shallow saturated zone between 5 and 15 feet bgs was not encountered. Groundwater was first observed in borings SP-5 and SP-8 at a depth of 20 feet bgs, in soil boring SP-6 at a depth of 21 feet bgs and in soil boring SP-7 at a depth of 32 feet bgs. Groundwater stabilized at depths between approximately 15 and 15.5 feet. SECOR's field procedures are included in Appendix B.

3.5 Soil Vapor Well Installation

On December 27, 2006, three soil vapor wells (VP-1, VP-2, and VP-3) were installed. Soil vapor wells VP-1 and VP-2 were advanced south of the UST pit, and soil vapor well VP-3 was

advanced north of the UST pit (Figure 2). The boreholes for the soil vapor wells were advanced using a 6-inch diameter hand auger to depths of 5.5 feet bgs (VP-2), and 6 feet bgs (VP-1 and VP-3). The soil vapor wells were completed by holding the vapor probe tip (attached to 8 feet of Tygon tubing) 6 inches above the bottom of the borehole and emplacing a #3 Monterey sand filter pack that extended 6 inches below and 6 inches above the probe. A six-inch hydrated bentonite seal was placed above the sand, and neat cement grout was placed above the bentonite seal to approximately six inches bgs. The probes were completed at the surface with a well box and concrete dyed to match existing grade. A Swagelok fitting was place on the end of the Tygon tubing, and was turned to the closed position during the construction of the soil vapor well.

SECOR's field procedures are included in Appendix B.

3.6 Subslab Vapor Probe Installation

On December 27, 2006, a subslab vapor probe (SUBSLAB) was installed in the southeast corner of the station building, inside the auto repair bay (Figure 2). A 1/8-inch diameter, 6-inch long, stainless steel tube with a ½-inch diameter Swagelok compression fitting attached to the top was used to create the soil vapor probe. Spacer fittings were installed between the Swagelok fitting and the tubing to allow for the cement seal. The probe was assembled by Vironex after arrival at the site. A ¼-inch diameter inner hole was advanced to a depth of approximately 3 inches below the concrete building slab, and the cuttings were removed with a vacuum. A 1.5-inch diameter outer hole was advanced along the centerline of the inner hole to a depth of approximately 4.5 inches into the concrete slab. The probe was set in the inner hole and a cement seal was emplaced so as not to contact the Swagelok fitting. SECOR emplaced putty over the probe to protect it from foot traffic in the garage area.

When SECOR personnel returned to sample the subslab probe on February 1, 2007, the Swagelok fitting on the probe was loose. SECOR returned with Vironex on February 2, 2007 to remove the subslab vapor probe, tighten the Swagelok fitting, and reinstall the probe in the same location.

A schematic of the soil vapor probe is included as Figure 4. SECOR's field procedures are included in Appendix B. Concrete cuttings generated during the installation of the soil vapor probe were disposed of by Vironex as construction waste.

3.7 Groundwater Monitoring Well Installation

From January 2 to 4, 2007 four groundwater monitoring wells (MW-6, MW-7, MW-8, and MW-9) were installed using a HSA rig equipped with 8-inch diameter auger flights. Monitoring well MW-6 was installed near the location of destroyed monitoring well MW-2, monitoring well MW-7 was installed in the southern corner of the site, monitoring well MW-8 was installed on the east corner of South Delaware Street and East Fourth Avenue, and monitoring well MW-9 was installed near the location of destroyed monitoring well MW-1 (Figure 2). The groundwater monitoring well borings were advanced to a depth of 20 feet bgs for MW-6, 26.5 feet bgs for MW-7, 30 feet bgs for MW-8, and 17 feet bgs for MW-9. Groundwater was first encountered at 15.9 feet bgs in MW-6, 22 feet bgs in MW-7, 18 feet bgs in MW-8, and 14.7 feet bgs in MW-9. Groundwater stabilized at depths between approximately 13 and 18 feet bgs.

The monitoring wells were constructed using 2-inch diameter poly vinyl chloride (PVC) casing with a 0.020-inch slotted screen interval extending from 13 to 19 feet bgs for MW-6, 22 to 25 feet bgs for MW-7, 17 to 30 feet bgs for MW-8, and 11.5 to 15 feet bgs for MW-9. A filter pack of #3 Monterey sand was placed in the annulus across from the screen and 1 to 2 feet above the screen. A 2 to 3 foot thick bentonite seal (hydrated chips) was placed above the sand pack. Neat cement grout (mixed at a ratio of 6 gallons of water per 94 pounds of Portland cement) was tremmied from the top of the bentonite seal to 1 foot bgs. The wells were completed at the surface with a traffic rated well box set in concrete dyed to match the existing grade, and a locking well cap was placed on the casing. The well materials were tremmied through the annulus of the HSA flights. Because a potential aquitard was encountered at the bottom of the boreholes for monitoring wells MW-6, MW-7, and MW-9, a bentonite seal was emplaced within this fine-grained material at the bottom of each of these three boreholes prior to well construction. These potential aquitards were not penetrated through during the drilling operations.

SECOR's field procedures are included in Appendix B. Boring logs illustrating well construction details are included in Appendix C.

3.8 Grab Groundwater Sample Collection and Analysis

Grab groundwater samples were collected from soil borings SP-5 through SP-8. The groundwater samples were collected by lowering a disposable bailer through the annulus of the direct push casing. The samples were transferred from the bailers, using a low-flow control spigot, into 40 milliliter (ml) volatile organic analyte (VOA) vials preserved with hydrochloric acid (HCl). The VOAs were placed on ice, and submitted to a California certified laboratory to be analyzed for the presence of total purgeable petroleum hydrocarbons (TPPH); BTEX; MTBE; ethanol, TBA, tertiary amyl methyl ether (TAME), di-isopropyl ether (DIPE), ethyl tertiary butyl ether (ETBE), ethylene dibromide (EDB), and 1,2-dichloroethane (1,2-DCA) by EPA Method 8260B.

3.9 Soil Sample Collection and Analysis

The direct push soil borings were sampled continuously, and the monitoring well borings were sampled every 5 feet, or more frequently to continuously as necessary to investigate soil stratigraphy, using a modified California sampler. The borings were described in accordance with the Unified Soil Classification System (USCS) by a SECOR scientist under the direction of a California Professional Geologist. Soil samples from the direct push soil borings were contained in Teflon® liners that were inserted into the sample collection rod. Soil samples from the monitoring well borings were contained in 2 inch diameter by 6 inch long brass sleeves that were inserted into the modified California sampler. Soil samples were examined for odors, visible signs of petroleum hydrocarbons, and screened for hydrocarbon vapors using a photo-ionization detector (PID). Samples were submitted for analysis from above the water bearing zone, potential aquitards at the bottom of the borings, depths of previously known impact, and if elevated hydrocarbon vapors were detected from that approximate depth using the PID. The soil samples were placed on ice and submitted to a California certified laboratory to be analyzed for the presence of TPPH; BTEX; MTBE; ethanol, TBA, TAME, DIPE, ETBE, EDB, and 1,2-DCA by EPA Method 8260B.

Boring logs are included in Appendix C.

3.10 Soil Boring Borehole Completion

Upon completion of groundwater sampling, each soil boring borehole was backfilled with neat cement grout. In accordance with SMCHD-GPP guidelines, the grout was mixed at a ratio of 6 gallons of water per 94 pounds of Portland cement, and was introduced into the borehole through a tremmie pipe to displace standing water in the hole. A cement cap was placed at the surface of soil borings SP-6 and SP-8 to match the existing grade. An asphalt cold patch cap was placed at the surface of soil borings SP-5 and SP-8.

3.11 Monitoring Well Development, Sampling, and Analysis

On January 9, 2007, SECOR personnel developed the newly installed monitoring wells MW-6 through MW-9. Approximately 10 casing volumes were purged from wells MW-6 and MW-8, approximately 12 casing volumes were purged from well MW-7, and approximately 34 casing volumes were purged from well MW-9. The last three successive measurements of temperature, conductivity, and pH of the purged groundwater varied by ≤10%, ≤3%, and ≤0.1, respectively.

On January 26, 2007, SECOR personnel purged and sampled groundwater monitoring wells MW-4 and MW-6 through MW-8, using low-flow protocol at a flow rate of less than 200 milliliter (mL) per minute using a bladder pump. Due to the small amount of groundwater in groundwater monitoring well MW-9, a peristaltic pump was used to purge and sample the water at a flow rate of less than 100 mL per minute. The pump intakes were placed at depths in the water column that were opposite the portion of the saturated zone expected to contain the greatest hydrocarbon impact. Criteria for this selection included the depth of the highest soil impact encountered during well installation, the as-built screen interval, and the recorded depth to water. The pump intake was placed at 15 and 17 feet deep in MW-4 and MW-6, respectively (depths of highest soil impact), at the top of the screened interval in wells MW-7 and MW-8 (because there was no detected soil impact and the screens were submerged), and at the only depth possible due to minimal water encountered in MW-9. The conductivity, temperature, and pH of the delivered effluent were monitored every three to five minutes using a flow-through cell during purging and recorded on the field data sheets. Purging ended once three successive measurements of pH, conductivity, and temperature of the purged water stabilized to within 0.1, 3%, and 10%, respectively.

Following monitoring well purging, groundwater samples from wells MW-4, MW-6, MW-7, and MW-8 were collected using a low-flow bladder pump, and the groundwater sample from well MW-9 was collected using a peristaltic pump. Each groundwater sample was discharged from the pump tubing, after disconnecting the tubing from the inlet of the flow-through cell, into 40-mL VOAs preserved with HCl. The VOAs were placed on ice, and submitted to a California certified laboratory to be analyzed for the presence of TPPH, BTEX, MTBE, and tetrachloroethene (PCE) by EPA Method 8260B.

Field data sheets illustrating onsite activities, including system or line volumes, actual purge volumes, purging equipment, and sampling equipment used, are included in Appendix D.

3.12 Groundwater Monitoring Well Destruction

On January 2 and 3, 2007, four groundwater monitoring wells (MW-1, MW-2, MW-3, and MW-5) were destroyed. Due to the close proximity of underground electric lines, groundwater monitoring wells MW-1 and MW-3 were destroyed following SMCEHD guidelines for pressure grouting. Neat cement grout (mixed at a ratio of 6 gallons of water per 94 pounds of Portland cement) was tremmied into the well from the bottom up to displace standing groundwater in the well. A pressure fitting was attached to the top of the well casing and 25 pounds per square inch (psi) pressure was applied to the grout column inside the well casing for approximately 5 minutes. The well box and the upper foot of the well casing were removed prior to surface completion with concrete, dyed to match the existing grade. Groundwater that was displaced from the borehole during pressure grouting was contained and managed as site waste. Groundwater monitoring wells MW-2 and MW-5 were destroyed by over drilling, and were cleared to 5 feet bgs using an air lance and vacuum truck prior to mechanical drilling. From 5 feet bgs to the well terminus, the groundwater monitoring wells were drilled using 8-inch diameter HSA, and the well casing and annular materials were removed. The destroyed monitoring well boreholes were backfilled using neat grout cement (mixed at a ratio of 6 gallons of water per 94 pounds of Portland cement), tremmied from the bottom of the borehole to approximately 1 foot bgs. The boreholes were completed at the top using concrete dyed to match the existing grade.

SECOR's field procedures are included in Appendix B.

3.13 Monitoring Well Surveying

On January 16, 2007 SECOR observed Morrow Surveying, Inc. (Morrow) survey soil borings SP-5 through SP-8, newly installed monitoring wells MW-6 through MW-9, and soil vapor wells/probe VP-1 through VP-3 and SUBSLAB. The borings and wells were surveyed for geographical location to the NAD 83 (1986) Datum, and for elevation to the NAVD 88 Datum from geo-positioning satellite (GPS) observations. A copy of the Morrow survey map is included in Appendix E.

3.14 Groundwater Gradient Evaluation

On January 26, 2007, SECOR field staff collected depth to water measurements prior to the purging and sampling of groundwater monitoring wells MW-4 and MW-6 through MW-9. These depths to water were used to calculate groundwater elevations and evaluate the groundwater gradient. The groundwater gradient was evaluated to flow to the east at a magnitude of 0.003 foot per foot (Figure 5). This groundwater gradient is consistent with historical gradients that have been evaluated at the site (Table 3, Figure 3).

3.15 Soil Vapor Sample Collection and Analysis

On January 19, 2007, SECOR performed soil vapor sampling. Prior to sampling, SECOR field personnel verified that there had not been a significant precipitation event within the previous 5 days. It was determined that 0.14 inches of rain fell on January 16, 2007 and 0.02 inches of rain fell on January 18, 2007 by referencing www.wunderground.com. According to the

Department of Toxic Substances Control (DTSC) and California Regional Water Quality Control Board – Los Angeles Region (LARWQCB) Advisory dated January 28, 2003 "A. Wet Conditions: If no-flow or low-flow conditions are caused by wet soils, the soil gas sampling should cease. In addition, the Agency recommends that the soil gas sampling should not be conducted during or immediately after a significant rain even (e.g., ½ inch or greater) or onsite watering." Precipitation onsite was less than ½ inch in the past five days, so SECOR continued with the soil vapor sampling.

While performing a 15-minute leak test on the canisters and manifolds, one of the four manifolds would not hold a vacuum pressure. Field personnel decided to sample the three external soil vapor wells and return at a later date to sample the subslab vapor probe. SECOR returned to the site on January 26, 2007 to sample the subslab vapor probe. Soon after SECOR field personnel arrived on site it began to precipitate. The rate of precipitation was great enough to be considered a significant event, and soil vapor sampling was not performed. SECOR returned to the site on February 1, 2007 to perform additional sampling of soil vapor wells VP-1, VP-2, and VP-3, and to sample the subslab soil vapor probe. The Swagelok fitting on the subslab soil vapor probe was loose, indicating that a proper seal had not been created during the installation of the probe. Once the probe was reinstalled on February 2, 2007, SECOR field staff returned to the site on February 6, 2007 to sample the subslab probe.

During sampling events the summa canisters were received from the laboratory with the proper negative vacuum pressure of approximately -30.5 to -31 millimeters of Mercury (mmHg), a ½-hour flow regulator (airflow at 200 milliliters per minute) was used, the manifold system passed the 15 minute leak check, a purge was performed to remove approximately 5 liters (a 26.5 change in vacuum pressure) of sub-surface vapors from the soil vapor probes VP-1, VP-2, and VP-3, and isopropyl alcohol was applied to the Tygon tubing connections at intervals of approximately 5 minutes. The change in vacuum pressure to purge three systems volumes was calculated prior to arrival in the field, using a tubing inner diameter measurement of 0.25 inches, an assumed porosity of 30% airspace, and the tubing lengths and annulus measurements listed earlier in this report. The sampling interval on January 26, 2007 was between 31 minutes (VP-3) and 35 minutes (VP-2) and on February 1, 2007 was between 43 minutes (VP-1) and 46 minutes (VP-2). During the SUBSLAB sampling event, the summa canisters were received with a proper negative vacuum pressure of approximately -30.25 and -30.5 mmHg, a ½ hour flow regulator was used, the manifold system passed a 15 minute leak check, a purge was performed to remove 2 liters of sub-surface vapors from the probe, and isopropyl alcohol was applied to the Tygon tubing connections at intervals of approximately 5 minutes. The sampling interval was 14 minutes. A schematic of the Sub Slab soil vapor sampling apparatus is included as Figure 6. SECOR's field procedures, including purge calculations, are included in Appendix B. Copies of the field notes collected during sampling are included in Appendix D.

The soil vapor samples were sent under chain-of-custody documentation to AirToxics Ltd., a California-state certified laboratory in Folsom, California. The samples were analyzed for the presence of total gasoline range petroleum hydrocarbons by Environmental Protection Agency (EPA) Method TO-3; benzene, toluene, ethylbenzene, xylenes, MTBE, TBA, 1,2-DCA, ethyl tertiary butyl ether, tertiary amyl methyl ether, isopropyl ether, ethylene dibromide, ethanol, 1,3-dichlorobenzene, 1,4-dichlorobenzene, and isopropyl alcohol (IPA, or 2-propanol) by EPA Method TO-14A; and the atmospheric gases oxygen (O_2), methane (CH_4), and carbon dioxide (CO_2) by ASTM D-1946. Laboratory reporting limits for the atmospheric gases were set at

reporting limits less than or equal to ambient concentrations, and were set at ≤100 micrograms per cubic meter (µg/m3) for IPA.

3.16 Investigation Derived Waste

Soil cuttings, decontamination rinsate, and purge water generated during the site assessment activities performed between December 14, 2006 and January 26, 2007 were stored in 19 Department of Transportation (DOT) approved 55-gallon capacity steel drums (13 containing soil and 6 containing waste water). These drums were staged onsite pending laboratory characterization as non-hazardous waste. Filter Recycling Services (FRS) of Colton, California transported the drums to their licensed facility in Rialto, California for disposal on February 14, 2007. The waste disposal documentation is included as Appendix F.

4.0 FINDINGS

4.1 Subsurface Conditions

Subsurface materials encountered at the site generally correlated well with those previously reported, as shown on the geologic cross sections, Plate 1, and boring logs, Appendix C. Silt with some silty sand and gravel intervals was encountered from the ground surface to depths of approximately 5 to 16 feet bgs. This silt was underlain by silty sand and gravel with minor silt interbeds to approximate depths of 15 to 25 feet bgs. Wells MW-4, MW-6, MW-7, MW-8, and MW-9 appear to be screened in this first water bearing zone ranging between the approximate depths of 10 and 25 feet bgs. Beneath this water-bearing zone, a silt aquitard varying in thickness from approximate 1.5 to 14 feet thick was encountered. This aquitard was relatively continuous, except in the area of wells MW-4 and MW-8, which may be within a channel deposit. The aquitard was underlain by a deeper water-bearing zone beginning at the approximate depths of 18 feet bgs in the site area and east of the site, and 32 feet bgs southeast of the site (SP-7). The bottom of this deeper water-bearing zone was not encountered.

When SECOR first mobilized to the site in December 2006 to drill the Geoprobe borings, water was not encountered in the shallow water-bearing zone, enabling grab sampling of the groundwater in the deeper water bearing zone. SECOR anticipated drilling wells into this deeper water-bearing zone during the second mobilization less than three weeks later; however, upon the second mobilization, groundwater was present in the shallower water-bearing zone.

4.2 Soil Analytical Results

A total of 34 soil samples were submitted for laboratory analysis from soil borings SP-5, SP-6, SP-7, SP-8, MW-6, MW-7, MW-8, and MW-9. Analytical results indicated the presence of up to 1,300 milligrams per kilogram (mg/kg) TPPH (MW-6@16.5-17), 0.18 mg/kg benzene (MW-6@11-11.5), 32 mg/kg toluene (MW-6@11-11.5), 20 mg/kg ethylbenzene (MW-6@11-11.5), 110 mg/kg total xylenes (MW-6@11-11.5), and 0.089 mg/kg MTBE (MW-6@19.5-20). The remaining requested petroleum hydrocarbon constituents were not detected above the laboratory reporting limits.

Soil analytical results are summarized in Table 4 and included in Table 1. The laboratory reports with certified analytical results and chain-of-custody documentation are included in Appendix G.

4.3 Groundwater Analytical Results

Nine groundwater samples were submitted for laboratory analysis from soil borings SP-5, SP-6, SP-7, and SP-8, and monitoring wells MW-4, MW-6, MW-7, MW-8, and MW-9. Grab sample analytical results indicated the presence of up to 51,000 µg/L TPPH (SP-8), 1,300 µg/L benzene (SP-5), 1,500 µg/L toluene (SP-5), 1,500 µg/L ethylbenzene (SP-5), 9,600 µg/L total xylenes (SP-8), and 330 µg/L MTBE (SP-5). Groundwater samples from the wells contained petroleum hydrocarbons in MW-6 (67,000 µg/L TPPH, 380 µg/L benzene, 8,600 µg/L toluene, 3,600 µg/L ethylbenzene, 17,000 µg/L total xylenes, and 62 µg/L MTBE), and MW-9 (0.73 µg/L xylenes).

The remaining requested petroleum hydrocarbon constituents were not detected above the laboratory reporting limits.

Due to anomalous laboratory results during the third quarter 2006 groundwater sampling event in the TPPH range, SECOR requested that the groundwater samples be analyzed for the presence of PCE. Laboratory results indicated that analytical results within the TPPH range for four of the five site wells (MW-4, MW-7, MW-8, and MW-9) were due to the presence of PCE in the groundwater, and not the presence of petroleum hydrocarbons.

Groundwater analytical results are summarized in Table 5, and included on Table 2. The laboratory reports with certified analytical results and chain-of-custody documentation are included in Appendix G.

4.4 Soil Vapor Analytical Results

Laboratory analysis of the soil vapor samples collected from wells VP-1, VP-2, and VP-3 on January 19, 2007 indicated the presence of 0.75 µg/m^3 TPPH (VP-3), up to 16 µg/m^3 toluene (VP-1), 14 µg/m^3 ethylbenzene (VP-3), 42 µg/m^3 m,p-xylenes (VP-3), and 29 µg/m^3 o-xylenes (VP-3). The laboratory analysis additionally indicated that the samples were composed of 21-22% O_2 and 0.46-0.98% CO_2. The remaining requested compounds were not reported at concentrations greater than the laboratory reporting limits. IPA was not detected above the laboratory reporting limits in the soil vapor samples.

Laboratory analysis of the soil vapor samples collected from wells VP-1, VP-2, and VP-3 on February 1, 2007 indicated the presence of 0.27 µg/m^3 TPPH (VP-3), 5.4 µg/m^3 toluene (VP-1), 5.8 µg/m^3 ethylbenzene (VP-3), 7.8 µg/m^3 m,p-xylenes (VP-3), and 12 µg/m^3 o-xylenes (VP-3). The laboratory analysis additionally indicated that the samples were composed of 20-21% O_2 and 0.52-1.0% CO_2. The remaining requested compounds were not detected at concentrations greater than the laboratory reporting limits. IPA was detected at a concentration of 12 µg/m^3 in the vapor sample collected from well VP-3.

For comparison purposes, the environmental screening level (ESL), as established by the state of California Regional Water Quality control Board (CRWQCB), for TPPH in shallow soil gas is 26,000 µg/m^3. This ESL is for residential land use, which is stricter than the ESL for commercial/industrial land use. The residential ESL for TPPH in indoor air is 26 µg/m^3. The commercial ESLs for shallow soil gas and indoor air are 72,000 µg/m^3 and 36 µg/m^3, respectively (CRWQCB, 2005). The atmospheric gases O_2, CH_4, CO_2 exist in nature at approximately 20.95%, 0.00017%, and 0.0360%, respectively (Pidwirny, 2006).

Soil vapor analytical results are summarized in Table 6. The laboratory reports with certified analytical results and chain-of-custody documentation are included in Appendix G.

4.5 Geotracker Upload

Data associated with this assessment report has been uploaded to the California State Geotracker database. Confirmation of this electronic submittal is included in Appendix H.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Excavation has been performed at the eastern end of the tank pit and hydrocarbons in soil appear to be adequately delineated by borings MW-1, MW-7, MW-8, MW-9, SP-5, SP-6, and SP-7.

The groundwater gradient evaluated from the newly constructed wells discreetly screened in the shallow water-bearing zone is consistent with previous gradients. This is likely due to the seasonal presence of groundwater in the shallow water-bearing zone, and hydraulic connection between the two water bearing zones in the area of MW-4 and possibly MW-8.

The lateral extent of dissolved-phase hydrocarbons in shallow groundwater is delineated to the northwest, northeast, and southwest (upgradient and crossgradient) by wells MW-9, MW-8, and MW-7. SECOR recommends a downgradient well in the shallow water-bearing zone to delineate the lateral extent of dissolved-phase hydrocarbons in this zone.

The lateral extent of dissolved-phase hydrocarbons in deeper groundwater is delineated to the southwest (crossgradient) by SP-7. Concentrations of dissolved phase petroleum hydrocarbons in offsite soil borings SP-5 and SP-8 indicate that further downgradient delineation of the dissolved phase hydrocarbon plume in the deeper water-bearing zone is warranted. SECOR proposes to perform further offsite assessment to install downgradient wells along East Fifth Avenue and Delaware Street. Wells in the deeper water-bearing zone will also be necessary northwest and northeast of the site for gradient evaluation and delineation of hydrocarbons in this zone. SECOR recommends drilling these deeper zone wells during the summer or fall to avoid the necessity for conductor casing.

Due to previous detections of PCE in the groundwater, analysis for PCE and historical research of properties in the vicinity of the site to investigate a potential source of the solvent PCE should be performed.

The two separate soil vapor well sampling events showed good correlation between the analytical results. The gases (O_2, CH_4, and CO_2) did not show deviations between events, and were within an acceptable deviation of percentages found in the atmosphere. The maximum concentrations of toluene (16 µg/m^3), ethylbenzene (14 µg/m^3), and xylenes (42 µg/m^3) reported were less than or approximately 0.01 percent of the commercial land use shallow soil gas ESLs of 180,000 µg/m^3 toluene, 1,200,000 µg/m^3 ethylbenzene, and 410,000 µg/m^3 xylenes, and less than 0.1 percent of the residential land use ESLs of 63,000 µg/m^3 toluene, 420,000 µg/m^3 ethylbenzene, and 150,000 µg/m^3 xylenes (CRWQCB, 2005). Additionally, the maximum concentration of TPPH reported (0.75 µg/L, or 750 µg/m^3) was approximately 1 percent of the commercial land use shallow soil gas ESL of 72,000 µg/m^3 , and less than 3 percent of the residential land use shallow soil gas ESL of 26,000 µg/m^3. IPA was detected in the soil vapor sample from VP-3 during the second round of sampling. An overall decrease in the petroleum hydrocarbon compounds between sampling events in vapor well VP-3 could have been caused by a small leak in the sampling apparatus; however, the reported concentration of IPA (12 µg/m^3) was negligible, and the concentrations reported during the sampling event without evidence of a leak were below ESLs. The subslab soil vapor sample did not contain petroleum hydrocarbon compounds at concentrations greater than the laboratory limits. IPA was reported

in the subslab soil vapor sample, but the concentration does not indicate that large enough leak occurred to dilute the sample. None of the petroleum hydrocarbon compounds detected were at levels above the residential shallow soil gas ESLs. SECOR does not believe that vapor inhalation is an exposure pathway at the site due to the low concentrations of gaseous petroleum hydrocarbons at a depth of approximately 5 feet bgs, and that subsurface material between the surface and the depth of sampling (silt) most likely acts as a barrier to the migration of soil vapor.

6.0 LIMITATIONS

This report was prepared in accordance with the scope of work outlined in SECOR's contract and with generally accepted professional engineering and environmental consulting practices existing at the time this report was prepared and applicable to the location of the site. It was prepared for the exclusive use of ConocoPhillips Company and its representatives, for the express purpose stated above. Any re-use of this report for a different purpose or by others not identified above shall be at the user's sole risk without liability to SECOR. To the extent that this report is based on information provided to SECOR by third parties, SECOR may have made efforts to verify this third party information, but SECOR cannot guarantee the completeness or accuracy of this information. The opinions expressed and data collected are based on the conditions of the site existing at the time of the field investigation. No other warranties, expressed or implied are made by SECOR.

1 Analyzed by EPA Method 3550/8015M
2 Analyzed by Standard Method 5520 E&F (Gravimetric)
3 Analyzed by EPA Method 5030/8015M between 8/1992 and 3/1995; by EPA Method 8260 between 12/2006 and the present.
4 Analyzed by EPA Method 8020 between 8/1992 and 3/1995; by EPA Method 8260 between 12/2006 and the present.
5 Analyzed by EPA Method 8260B
6 Analyzed by EPA Method 6000/7000

a Sample was analyzed for Halogenated Volatile Organic Hydrocarbons (HVOCs) by EPA Method 8010. Tetrachloroethene was detected at 6.4 mg/kg. The additional HVOCs were reported as non-detect.
b Chromatograph pattern: Diesel and non-diesel mixture (<C14; >C22).
c Sample was analyzed for HVOCs by EPA Method 8010. All HVOCs were reported as non-detect.
d The Continuing Calibration Verification (CCV) recovery was not within established control limits.
e The PQL was raised due to sample dilution.

a Chromatograph pattern: diesel and non-diesel mixture (<C16; >C22).
b The presence of MTBE was potentially identified at reportable levels.
c The presence of MTBE was identified at a level equal to or above the taste and odor threshold of 40 µg/L.
d The hydrocarbons detected appeared to be gasoline and a non-gasoline mixture.
e Chromatograph pattern: unidentified hydrocarbons C6-C12

TABLE 2
HISTORICAL GROUNDWATER GAUGING AND ANALYTICAL DATA

76 Service Station #6390
402 South Delaware Street
San Mateo, California

Sample ID	As - Built Screen Interval (feet, below TOC)	TOC Elevation (feet)	Date Sampled	Depth to GW (feet)	GWE (feet)	GWE Change (feet)	SPH Thickness (feet)	Sheen	TPHd [1] (µg/L)	TPPH [2] (µg/L)	BTEX [3]				Fuel Oxygenates									Organic [6]
											Benzene (µg/L)	Toluene (µg/L)	Ethylbenzene (µg/L)	Xylenes (µg/L)	1,2-DCA [4] (µg/L)	DIPE [4] (µg/L)	EDB [4] (µg/L)	ETBE [4] (µg/L)	Ethanol [4] (µg/L)	MTBE [5] (µg/L)	TAME [4] (µg/L)	TBA [4] (µg/L)	PCE [4] (µg/L)	Lead (mg/L)

f Chromatograph pattern: weathered gasoline: C6-C12
g Chromatograph pattern: discrete peaks C8-C12
h Chromatograph pattern: discrete peaks
i Sample was additionaly run under EPA Method 8260B. MTBE was detected at 1,140 µg/L. All other analytes were non-detect.
j Single analyte peak(s) were present in the requested fuel quantitation range. Fuel hydrocarbon pattern was not present.
k The concentration reported reflect(s) individual or discrete unidentified peaks not matching a typical fuel pattern.
l Chromatogram not typical of gasoline.
m TPPH was positive due to tetrachloroethane present in the sample.
n PQL was raised due to sample dilution.
o Tetrachloroethene was subtracted from the gasoline range TPH.
p The Continuing Calibration Verification (CCV) recovery was not within established control limits.
q The BC laboratory report indicated that reported concentration of 200 µg/L TPPH was due only to the presence of 90 µg/L PCE, 15 µg/L trichloroethane, and 9.8 µg/L cis-1,2-DCA; therefore, SECOR has represented the results for TPPH in this laboratory report as non-detect.

Analytical data prepared by Sequoia Analytical between 6/15/94 and 2/18/04; by Severn Trent Laboratories between 8/21/03 and 3/01/06; by BC Laboratories between 8/02/06 and the present.

bgs	Below ground surface	EPA	Environmental Protection Agency	MTBE	Methyl tertiary butyl ether	TAME	Tert-amyl methyl ether		

1 TOC elevations were surveyed by Morrow Surveying to the NAVD 88 Datum by GPS observations on 1/18/2007.
2 Depth was recorded from below ground surface for soil borings and from below the TOC for monitoring wells.
3 Analyzed by EPA Method 8260

a The PQL was raised due to sample dilution.
b Tetrachloroethene was subtracted from the gasoline range TPH.
c The Continuing Calibration Verification (CCV) recovery was not within established control limits.
d The BC laboratory report indicated that reported concentration of 200 µg/L TPPH was due only to the presence of 90 µg/L PCE, 15 µg/L trichloroethane, and 9.8 µg/L cis-1,2-DCA; therefore, SECOR has represented the results for TPPH in this laboratory report as non-detect.

SUBJECT: CONOCOPHILLIPS 76 STATION #6390 AT 402 SOUTH DELAWARE STREET, SAN MATEO, CALIFORNIA

Dear Mr. Kosel:

Thank you for the December 5, 2005, work plan prepared by SECOR International Incorporated. Unfortunately, San Mateo County Groundwater Protection Program (GPP) staff cannot approve the work plan for the following reasons: 1) insufficient detail was provided to evaluate the value of the proposed work; 2) the proposed work appeared insufficient to meet the objective; and 3) some of the specified field protocols violate County requirements without justification. We must say we were disappointed with the work plan considering it was submitted almost eight months after it was due.

The laboratory results from the analysis of soil samples indicates the greatest hydrocarbon impact in soil is generally between 15 and 18 feet below grade (fbg). In addition, the boring logs indicate the site is underlain by an interbedded sequence of low and high permeability soils. Therefore, the laboratory results from SP-1, SP-2, and SP-4 have limited use to assess the lateral and vertical extent of dissolved-phase hydrocarbons because these borings were drilled to only 13 fbg. This situation was discussed at the bottom of Page One of our letter dated January 20, 2005. However, it appears the work plan only proposes to sample "first" groundwater (Bullet #3 on Page Five). The work plan does indicate an additional groundwater sample will be collected from the "desired depth" from a hydropunch drilled in an adjacent boring if a low-permeability layer is encountered, but we cannot establish what this action proposes to investigate. Therefore, we cannot approve the work because we cannot establish if it has a reasonable chance of obtaining the objective (assessment of dissolved-phase plume). Clearly, there is sufficient historical data to propose and justify grab groundwater sampling intervals. Furthermore, we expect the work plan to indicate what sample selection will be based on if field data do not support the historical data. It is imperative soil and groundwater sample selection for laboratory analysis not only be based on PID readings and depth to groundwater, as stated in the work plan, but also stratigraphy, distance from source areas, and the depth of previously identified impacts.

GPP staff concur Monitoring Wells MW-5 and MW-1 through MW-3 should be destroyed because they are screened across low permeability strata. We also concur some replacement wells are necessary. However, the work plan simply proposed to install one replacement well per destroyed well and did not provide any details on the proposed construction of the replacement wells. Again, we would argue there is sufficient historical data to propose and

justify the number of replacement wells and appropriate screened interval(s). Furthermore, we expect the work plan to indicate what the screened interval will be based on if field data does not support the historical data (just saying stratigraphy is not sufficient). ConocoPhillips might be able to justify not installing a replacement well near MW-1 to monitor the sand and gravel between 20 and 25 fbg based on the laboratory results from the historical analysis of groundwater samples from MW-1 when depth to groundwater was >15 fbg (below the uppermost gravel layer). Also, installing the replacement well(s) for MW-3 a little further southwest (e.g. 10 feet) of the existing location may assist in assessment.

The proposed subsurface vapor sampling locations appear reasonable. However, the work plan was extremely inadequate in discussing the proposed vapor sampling work. It is essential all details of the sampling apparatus and sampling methodology be provided and justified (especially given the high failure rates we have seen in performing this task). Furthermore, some of the proposed vapor sampling procedures (e.g. using a Tedlar bag for the vapor sample; raising drill rod before installing and sealing sample tubing; using bentonite to backfill the unsaturated zone portion of vapor borings) violate GPP requirements. Proposed deviations from our requirements must be justified in the work plan. Please note, the groundwater monitoring well portion of the field procedures in Attachment 3 indicates the stability criterion for pH is 0.1%. In addition, the Well Installation and Groundwater Monitoring Well Development portion of the field procedures in Attachment 3 indicates the balance of the borehole above the two-foot-thick bentonite seal placed above the filter pack will consist of bentonite. These procedures would also violate County requirements.

Please upload a revised work plan to the State Geotracker database by **June 26, 2006**. The revised work plan should include the area map prepared by Morrow Surveying in December 2005 (Page Four of the December 2005 work plan).

Please call me at (650) 363-4972 if you have any questions.

Sincerely,

Deno G. Milano, P.G.

Sacramento, CA 95818

SUBJECT: CONOCOPHILLIPS 76 STATION #6390 AT 402 SOUTH DELAWARE STREET, SAN MATEO, CALIFORNIA

Dear Mr. Kosel:

Thank you for the June 22, 2006, work plan prepared by SECOR International Incorporated. The following comments are based on San Mateo County Groundwater Protection Program (GPP) staff review of this work plan and the project file.

The three monitoring wells at the Jiffy Lube site on Figure 2 were installed for the former Shell station at 407 S. Delaware Street. The field point name (FPN) of these wells is S-1, S-2, and S-3 (northwest, northeast, and southeast of the former UST cavity, respectively). These wells were destroyed in September 2001 as a condition of case closure. Please update the electronic file of Figure 2 to show the proper FPN of these wells and to indicate these wells were destroyed.

Page Five of the work plan proposes to collect soil samples from many depths for hydrocarbon analysis. One of the proposed depths is the bottom of the borehole. Please note, the objective of collecting soil samples below the water table is to assess the thickness of the smear zone and give an indication of groundwater contamination if groundwater samples cannot be collected from that depth. Simply deciding to sample soil at the total depth of the boring may or may not provide useful data for hydrocarbon assessment.

GPP staff are concerned that the proposed depth discrete groundwater sampling method may cross-contaminate groundwater samples collected below the water table. Groundwater may enter the boring through the bottom of the drill rod when soil samples are retrieved causing groundwater from different depths to mix and potentially cross-contaminate the hydropunch tool when it is lowered through the drill pipe. In addition, collecting soil and groundwater from the same drilling location makes it impossible to sample groundwater from a particular soil sample depth (i.e. one must assume the lithology surrounding the hydropunch is similar to the lithology of the previously logged soil sample). Nevertheless, to expedite the work, GPP staff will approve the depth discrete groundwater sampling portion of the work plan if the following conditions are implemented:

- Drill two borings at each depth discrete groundwater sampling location (one for soil logging to select appropriate groundwater sampling depths, the other to collect depth

RECEIVED
OCT 20 2006
By

discrete groundwater samples using a Waterloo Profiler or similar tool) unless you can demonstrate the proposed sampling method will obtain representative samples; and

- Delete proposed boring SP-5 unless you can demonstrate adequate smear zone assessment cannot be obtained from the boring proposed for MW-6.

The well destruction and vapor sampling portion of the work plan is approved with the following conditions:

- Destroy MW-5 and MW-1 through MW-3 as proposed in Bullet Three on Page Four of the work plan, not MW-1 and MW-3 through MW-5 as proposed on the top of Page Four of the work plan;

- Ensure the Swagelok® valve at the end of the tubing in the well box is installed in the closed position;

- Use bentonite granules, not powder, and limit bentonite thickness above the sand pack to 0.5 foot;

- Base the adequacy of vapor purging on vacuum drop, not time (submit purge calculations with the drilling permit application);

- Include the volume of air in the filter pack in purge calculations;

- Generate a isopropyl alcohol atmosphere around all connections not tested by the equipment leak (vacuum) test;

- Collect at least one additional subsurface vapor sample beneath the southeast portion of the station building to evaluate if a current vapor inhalation risk may exist to the occupants of the station building; and

- Do not collect vapor samples <5 days after the occurrence of measurable precipitation unless you can demonstrate such data would be representative of subsurface conditions.

GPP staff approve the replacement wells proposed for the onsite wells. However, it appears the construction of the offsite wells should be postponed pending the results of the depth discrete groundwater sampling. In the interim, please consider drilling additional depth discrete groundwater sampling boring pairs near MW-8, SP-4, and MW-5. The need and proposed construction of offsite wells can be recommended in the report on the depth discrete groundwater sampling.

The assessment report must include waste manifest(s), base 10 scaled figures showing all sampling locations to date, and tables summarizing historical gauging data and the laboratory results of all soil, groundwater, and vapor sample analyses performed to date (one table for soil, one for groundwater, and one for vapor). Do not simply include historical tables in an appendix. Each table should indicate the date and depth of sample collection, as appropriate, and the proper FPN. In addition, the site plan in the report should show the limits of excavation stated on Page Two of the work plan.

Table 1 and Paragraph One of Page Two of the work plan cite ethylbenzene, xylenes, nickel, and lead concentrations for Samples A1 through SW3 that differ from the concentrations listed in Tables 5 and 6 of the Kaprealian report dated May 11, 1995. Please verify these concentrations before finalizing the tables in the assessment report. Please upload the report and associated EDFs, GeoWell, GeoBore, GeoMap, and GeoXYZ files to the State Geotracker database by **February 28, 2007**.

Compliance Issues

Review of the State Geotracker database indicates a corrected GeoMap file for denied Confirmation # 6794980704 has not been uploaded as required. Please upload this file by **February 28, 2007**.

A recent public hearing notice mailed to GPP staff by the City of San Mateo indicated the property owner's address was 555 Laurel Avenue, Apartment #425 in San Mateo, California. Our records indicate the property owner lives in Paso Robles, California. Please investigate this discrepancy and notify GPP staff of the property owner's current address. I can be reached at (650) 363-4972 if you have any questions.

Sincerely,

Deno G. Milano, P.G.

Revised March 2006

SUBSURFACE DRILLING APPLICATION

REQUIREMENTS:

An accurate & correct map of existing and proposed well/boring locations must be included with the permit application. The well/boring location map must include the following.

1. North arrow, existing & historic site features, wells, approximate property lines and any other pertinent existing & historic features and information.
2. Proposed well/boring locations to scale. As-built locations/dimensions must be finalized in subsequent report of findings.

A workplan is required by County Staff. Upon review of information on this application and the submitted workplan, and subject to approval noted below, a permit will be issued allowing well/boring owner, driller, and responsible professional (consultant) to perform the specified work. The permit is subject to both General and Special Conditions stated below. A copy of the approved Subsurface Drilling Permit must be available on site while work related to the permit is being performed. Drilling date and time must be scheduled with County staff at least three (3) working days in advance of field work.

GENERAL CONDITIONS:

A. Well and boring construction and destruction under this permit is subject to the Standards for the Construction of Wells in San Mateo County, County Groundwater Protection Program (GPP) Guidelines, Policies & Procedures, the State Water Well Standards, and any instructions by a Health Department representative.

B. Well/Boring Owner, Driller, and Responsible Professional assume responsibility for all activities and uses under the permit, including compliance with Workmen's Compensation Laws, and indemnify, defend and save the County of San Mateo, its' officers, agents and employees, free and harmless from any and all expense, cost, or liability in connection with or resulting from work or stopped-work associated with the permit, including, but not limited to, property damage, personal injury, wrongful death, and loss of income.

C. All borings must be properly destroyed (grouted/sealed) within 24 hours of drilling unless special conditions are approved in writing as part of this permit.

D. Analytical results of all soil and groundwater samples collected during the execution of drilling under this permit must be submitted to County GPP staff by the Responsible Professional within 60 days of sample collection. If contamination is discovered during drilling, verbal notification to County GPP by the Responsible Professional is required within 72 hours of discovery. Proper storage, labeling & disposal of investigation-derived wastes are the responsibility of the consultant unless stated otherwise contractually.

E. In addition to the County copy of the State DWR Form 188, boring logs and well construction details for all borings/wells, signed by a Responsible Professional, must be submitted to County GPP within 60 days of drilling/construction/destruction.

F. Permit is valid only for the purpose specified herein. No change in construction procedure, as described on this permit application, in the associated workplan, or in the special conditions below, will be allowed except upon written permission from the County.

G. Permit may be voided if field check reveals any misrepresentation of proposed well/boring locations on this permit application, the attached location map, or the submitted workplan.

H. Permit is valid for one mobilization only and is automatically canceled if not exercised, or if an extension is not requested by Responsible Professional and granted by County GPP, within 90 days of permit issuance date. Failure to notify staff of cancellation or delay in start time, in a timely manner, may result in additional hourly charges to be invoiced to the consultant by GPP Staff.

I. Wells installed under this permit may not be used for domestic, municipal, commercial, or irrigation water supply.

J. All workplans and reports related to work performed under County oversight must conform to County GPP guidelines, Regional Water Quality Control Board guidelines, and State Water Well Standards.

K. Top-of-casing elevation of all wells must be surveyed to the nearest 0.01-foot relative to Mean Sea Level (NAVD88) and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate.

L. Latitude and longitude of all wells must be surveyed with sub-meter accuracy relative to NAD83 and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate.

M. Violation of any requirement or general or special permit condition may result in an order by GPP staff to cease work under this permit, correct the violation, and potentially re-permit the work as a new mobilization.

Revised March 2006

SUBSURFACE DRILLING APPLICATION

REQUIREMENTS:

An accurate & correct map of existing and proposed well/boring locations must be included with the permit application. The well/boring location map must include the following.

1. North arrow, existing & historic site features, wells, approximate property lines and any other pertinent existing & historic features and information.
2. Proposed well/boring locations to scale. As-built locations/dimensions must be finalized in subsequent report of findings.

A workplan is required by County Staff. Upon review of information on this application and the submitted workplan, and subject to approval noted below, a permit will be issued allowing well/boring owner, driller, and responsible professional (consultant) to perform the specified work. The permit is subject to both General and Special Conditions stated below. A copy of the approved Subsurface Drilling Permit must be available on site while work related to the permit is being performed. Drilling date and time must be scheduled with County staff at least three (3) working days in advance of field work.

GENERAL CONDITIONS:

A. Well and boring construction and destruction under this permit is subject to the Standards for the Construction of Wells in San Mateo County, County Groundwater Protection Program (GPP) Guidelines, Policies & Procedures, the State Water Well Standards, and any instructions by a Health Department representative.

B. Well/Boring Owner, Driller, and Responsible Professional assume responsibility for all activities and uses under the permit, including compliance with Workmen's Compensation Laws, and indemnify, defend and save the County of San Mateo, its' officers, agents and employees, free and harmless from any and all expense, cost, or liability in connection with or resulting from work or stopped-work associated with the permit, including, but not limited to, property damage, personal injury, wrongful death, and loss of income.

C. All borings must be properly destroyed (grouted/sealed) within 24 hours of drilling unless special conditions are approved in writing as part of this permit.

D. Analytical results of all soil and groundwater samples collected during the execution of drilling under this permit must be submitted to County GPP staff by the Responsible Professional within 60 days of sample collection. If contamination is discovered during drilling, verbal notification to County GPP by the Responsible Professional is required within 72 hours of discovery. Proper storage, labeling & disposal of investigation-derived wastes are the responsibility of the consultant unless stated otherwise contractually.

E. In addition to the County copy of the State DWR Form 188, boring logs and well construction details for all borings/wells, signed by a Responsible Professional, must be submitted to County GPP within 60 days of drilling/construction/destruction.

F. Permit is valid only for the purpose specified herein. No change in construction procedure, as described on this permit application, in the associated workplan, or in the special conditions below, will be allowed except upon written permission from the County.

G. Permit may be voided if field check reveals any misrepresentation of proposed well/boring locations on this permit application, the attached location map, or the submitted workplan.

H. Permit is valid for one mobilization only and is automatically canceled if not exercised, or if an extension is not requested by Responsible Professional and granted by County GPP, within 90 days of permit issuance date. Failure to notify staff of cancellation or delay in start time, in a timely manner, may result in additional hourly charges to be invoiced to the consultant by GPP Staff.

I. Wells installed under this permit may not be used for domestic, municipal, commercial, or irrigation water supply.

J. All workplans and reports related to work performed under County oversight must conform to County GPP guidelines, Regional Water Quality Control Board guidelines, and State Water Well Standards.

K. Top-of-casing elevation of all wells must be surveyed to the nearest 0.01-foot relative to Mean Sea Level (NAVD88) and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate.

L. Latitude and longitude of all wells must be surveyed with sub-meter accuracy relative to NAD83 and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate.

M. Violation of any requirement or general or special permit condition may result in an order by GPP staff to cease work under this permit, correct the violation, and potentially re-permit the work as a new mobilization.

APPENDIX B
FIELD AND LABORATORY PROCEDURES

Hydraulic Push (GEOPROBE) Drilling

Utility Locating

Prior to drilling, boring locations are marked with white paint or other discernible marking and cleared for underground utilities through Underground Service Alert (USA). In addition, the first five feet of each borehole are air-knifed, or carefully advanced with a hand auger if shallow soil samples are necessary, to help evaluate the borehole location for underground structures or utilities.

Borehole Advancement

Single-Wall GEOPROBE:
Pre-cleaned push rods (typically one to two inches in diameter) are advanced using a hydraulic push type rig for the purpose of collecting samples and evaluating subsurface conditions. The drill rod serves as a soil sampler, and an acetate liner is inserted into the annulus of the drill rod prior to advancement. Once the sample is collected, the rods and sampler are retracted and the sample tubes are removed from the sampler head. The sampler head is then cleaned, filled with clean sample tubes, inserted into the borehole and advanced to the next sampling point where the sample collection process is repeated.

Dual-Wall GEOPROBE:
Pre-cleaned push rods are advanced using a hydraulic push type rig for the purpose of collecting samples and evaluating subsurface conditions. Larger diameter push rod(s) (typically 4 inches outer diameter) are advanced to the desired depth to seal the upper water-bearing zone. Outer rods are not extended into the saturated zone before collection of groundwater samples. Smaller diameter push rod(s) (typically 2 inches in outer diameter, but larger enough to almost completely fill the annulus of the outer push rod(s)) are advanced within the annulus of the outer push rod to the total depth. The lead inner rod serves as a soil sampler, and an acetate liner is inserted into the annulus of the lead inner rod prior to advancement. Once the soil sample is collected, the inner rod(s) and sampler are retracted and the sample tubes are removed from the sampler head. The sampler head is cleaned, filled with clean sample tubes, and the process of advancing the outer rods prior to the advancement of the sampler rods repeated until the total depth of sampling is reached.

Soil Sample Collection

The undisturbed soil samples intended for laboratory analysis are cut away from the acetate sample liner using a hacksaw, or equivalent tool, in sections approximately 6 inches is length. Hand augered portions of the boring are sampled using a slide hammer to drive brass liners into the soil. The 6 inch samples are lined at each end with Teflon® sheets and capped with plastic caps. Labels documenting job number, borehole identification, collection date, and depth are affixed to each sample. The samples are then placed into an ice-filled cooler for delivery under chain-of-custody to a laboratory certified by the State of California to perform the specified tests. The remaining collected soil that has not been selected for laboratory analysis is logged using the United Soil Classification System (USCS) under the

direction of a State Registered Professional Geologist, and is field screened for organic vapors using a photo ionization detector (PID), or an equivalent tool. Soil cuttings generated are stored in Department of Transportation (DOT) approved 55-gallon steel drums, or an equivalent storage container.

Grab Groundwater Sample Collection

Once the desired groundwater sampling depth has been reached, a Hydropunch tip is affixed to the head of the sampling rods. The Hydropunch tip is advanced between approximately 6 inches to one foot within the desired groundwater sampling zone (effort is made to emplace the Hydropunch screen across the center of the water table), and retracted to expose the Hydropunch screen. Grab groundwater samples are collected by lowering a pre-cleaned, single-sample polypropylene, disposable bailer down the annulus of the sampler rod. The groundwater sample is discharged from the bailer to the sample container through a bottom emptying flow control valve to minimize volatilization. Alternatively, groundwater samples are collected by lowering a disposable bailer through the sampler rod or into the borehole.

Collected water samples are discharged directly into laboratory provided, pre-cleaned, vials or containers and sealed with Teflon-lined septum, screw-on lids. Labels documenting sample number, well identification, collection date, and type of preservative (if applicable, i.e. HCl for TPPH, BTEX, and fuel oxygenates) are affixed to each sample. The samples are then placed into an ice-filled cooler for delivery under chain-of-custody to a laboratory certified by the State of California to perform the specified tests.

Borehole Completion

Upon completion of drilling and sampling, the rods are retracted. Neat cement grout, mixed at a ratio of 6 gallons of water per 94 pounds of Portland cement, is introduced, via a tremmie pipe, and pumped to displace standing water in the borehole. Displaced groundwater is collected at the surface into DOT approved 55-gallon steel drums, or an equivalent storage container. In areas where the borehole penetrates asphalt or concrete, the borehole is capped with an equivalent thickness of asphalt or concrete patch to match finished grade.

Hollow Stem Auger Drilling/Monitoring Well Installation

Utility Locating

Prior to drilling, boring locations are marked with white paint or other discernible marking, and cleared for underground utilities through Underground Service Alert (USA). In addition, the first five feet of each borehole are air-knifed, or carefully advanced with a hand auger if shallow soil samples are necessary, to help evaluate the presence of underground structures or utilities.

Borehole Advancement

Pre-cleaned hollow stem augers (typically 8 to 10 inches in diameter) are advanced using a drill rig for the purpose of collecting samples and evaluating subsurface conditions. Upon completion of drilling and sampling, if no well is to be constructed, the augers are retracted, and the borehole is filled with neat cement grout, mixed at a ratio of 6 gallons of water per

94 pounds of Portland cement, through a tremmie pipe, and pumped to displace standing water in the borehole. In areas where the borehole penetrates asphalt or concrete, the borehole is capped with an equivalent thickness of asphalt or concrete patch to match finish grade.

During the drilling process, a physical description of the encountered soil characteristics (i.e. moisture content, consistency or density, odor, color, and plasticity), drilling difficulty, and soil type as a function of depth are described on boring logs. The soil cuttings are classified in accordance with the USCS.

Soil cuttings are temporarily stored on-site in 55-gallon DOT approved drums pending laboratory analysis, waste profiling and proper disposal. A label is affixed to the drums indicating the contents of the drum, suspected contaminants, date of drilling, borehole number, and depth interval from which the contents were generated.

Split-Spoon Sampling

The precleaned split spoon sampler lined with three 6-inch long brass or stainless steel tubes is driven 18 inches into the underlying soils at the desired sample depth interval. The sampler is driven by repeatedly dropping a 140-pound hammer a free fall distance of 30 inches. The number of blows (blow count) to advance the sampler for each six-inch drive length is recorded on the field logs. Once the sampler is driven the 18-inch drive length or the sampler has met refusal (typically 50 blows per six inches), the sampler is retrieved. Alternatively, with a limited access rig, soil samples are obtained by driving the sample using a pneumatic hammer.

Of the three sample tubes, the bottom sample is generally selected for laboratory analysis. The sample is carefully packaged for chemical analysis by capping each end of the sample with a Teflon sheet followed by a tight-fitting plastic cap, and sealing the cap with non-VOC, self-adhering silicon tape. A label is affixed to the sample indicating the sample identification number, borehole number, sampling depth, sample collection date, and job number. The sample is then annotated on a chain-of-custody form and placed in an ice-filled cooler for transport to the laboratory.

The remaining soil samples are used for soil classification and field evaluation of headspace volatile organic vapors, where applicable, using a photo ionization or flame ionization detector calibrated to a calibration gas (typically isobutylene or hexane). VOC vapor concentrations are recorded on the boring logs.

Groundwater Monitoring Well Installation and Development

Groundwater monitoring wells are constructed by inserting or tremmieing well materials through the annulus of the hollow stem auger. The groundwater monitoring wells are constructed with a screen interval determined from the encountered soil stratigraphy, to maintain a proper seal at the surface (minimum three feet), and to avoid penetrating aquitards. Groundwater wells are installed in accordance with the conditions of the well construction permit issued by the regulatory agency exercising jurisdiction over the project site.

The well screen generally consists of schedule 40 polyvinyl chloride (PVC) casing with 0.01 to 0.02 factory slots. As a general rule, 0.01 inch slots are used in fine-grained silts and

clays and 0.02 inch slots are used in coarse-grained materials. The screen is then filter packed with #2/12 or #3 sand, or equivalent, for the 0.01 and 0.02 inch slots, respectively.

Once the borehole has been drilled to the desired depth, bentonite chips (to backfill an aquitard) or six inches of filter sand are tremmied to the bottom of the boring. The well screen and blank well casing are then inserted through the annulus of the hollow stem augers. The well screen is sand packed by tremmieing the appropriate filter sand through the annulus between the casing and augers while slowly retracting the augers. During this operation, the depth of the sand pack in the auger is continuously sounded so that the sand remains in the auger annulus during auger retraction to avoid short-circuiting the well. The sand pack is tremmied to approximately two feet above the screen, at which time pre-development surging is performed to consolidate the sand pack. Additional sand is added as necessary to help ensure that the sand pack extends a minimum of two feet above top of screen. Following construction of the sand pack, a two foot thick bentonite seal is tremmied over the sand and hydrated in place. The remainder of the borehole is backfilled with Portland neat cement grout (or the equivalent), mixed at ratio of 6 gallons of water per 94 pounds of neat cement. The well head is then capped with a locking cap and secured with a lock to protect the well from surface water intrusion and vandalism.

The well head is further protected from damage with traffic a rated well box in paved areas or locking steel riser in undeveloped areas. The protective boxes or risers are set in concrete. The details of well construction are recorded on well construction logs.

Following well construction, the wells are developed in accordance with agency protocols by intermittently surging and bailing the wells. Development is deemed to be sufficient once pH, conductivity and temperature stabilize to within approximately ≤ 0.1, ≤ 3%, and ≤ 10%, respectively, or when ten casing volumes have been removed.

Semi-Annual Groundwater Sampling

Depth to Groundwater/SPH Thickness Measurements

Prior to the beginning of purging and sampling the wells, the depth to groundwater and thickness of SPH, if present, within each well casing are measured to the nearest 0.01 foot using either an electronic water level indicator or an electronic oil-water interface probe. This is done in within as narrow a time frame as possible, and before the first well is purged. Measurements are taken from a point of known elevation on the top of each well casing as determined in accordance with surveys by licensed land surveyors.

Groundwater Monitoring Well Purging

Groundwater wells are purged using low-flow protocol at a flow rate of less than 1 liter per minute using a bladder pump. The purge intake is placed opposite the portion of the saturated zone expected to contain the greatest hydrocarbon impact, and the depth of the purge intake is recorded during and after purging. The water level in each well is monitored, and care is taken that the well is not dewatered. The conductivity, temperature, and pH of the delivered effluent are monitored and recorded using a flow-through cell during purge operations. Purge operations are determined to be sufficient once three successive measurements of pH, conductivity, and temperature of the purged water at 3 to 5 minute intervals following the evacuation of one system or line volume vary by ≤ 0.1, ≤ 3%, and ≤ 10%, respectively. System

or line volumes, actual purge volumes, and the purging equipment used are recorded on the field data sheets.

Groundwater Sample Acquisition, Handling, and Analysis

Following purging operations, groundwater samples are collected from each of the wells, using a low-flow bladder pump. The groundwater sample is discharged from the pump tubing to the sample container before the water passes through the flow-through cell. The sampling equipment is recorded on the field data sheets.

Collected water samples are discharged directly into laboratory provided, pre-cleaned, and chemically preserved sample containers for the analyses requested. Preservatives are used in the samples if appropriate for the analyses, i.e. hydrochloric acid (HCl) for TPPH, BTEX, and fuel oxygenates by EPA Method 8260B.

Labels documenting sample number, well identification, collection date and time, type of sample and type of preservative (if applicable) are affixed to each sample. The samples are then placed into an ice-filled cooler for delivery under chain of custody to a certified laboratory. The type of preservative used is documented on the chain of custody form.

To help assure the quality of the collected samples and to evaluate the potential for cross contamination during transport to the laboratory, a distilled-water trip blank accompanies the samples in the cooler. The trip blank is analyzed for the presence of volatile organic compounds of concern. For petroleum hydrocarbons, the trip blank is typically analyzed for TPHg, BTEX, and fuel oxygenates by EPA Method 8260.

Subslab Soil Vapor Probe Installation

Utility Locating

Prior to drilling, boring locations are marked with white paint or other discernible marking, and cleared for underground utilities through Underground Service Alert (USA). In addition, a private sub-surface utility locator is contracted, to help evaluate the presence of underground structures or utilities.

Borehole Advancement

A pilot hole, approximately 1/16-inch larger in diameter than the diameter of the soil vapor probe (though smaller in diameter than the head of the soil vapor probe), is advanced no further than 3 inches into the native material beneath the concrete building slab, using a rotary hammer drill or equivalent equipment. A shallow outer hole is advanced on top of the pilot hole. The diameter of the outer hole is large enough to accommodate the head of the soil vapor probe and the tools necessary to attach the sampling tubing to the probe, and is deep enough to allow the probe to be set flush with the slab surface. Slab cuttings are removed using a small portable vacuum.

Probe Installation

The soil vapor probe is constructed of small diameter (1/8-inch to ¼-inch outside diameter) chromatography grade 316 stainless steel tubing, stainless steel compression to thread fittings, and a Swagelok-type valve at the top of the probe. The tubing at the bottom of the

probe is cut to allow the probe to "float" in the slab, and avoid obstruction of the subslab material by the probe. The probe is set in the inner hole to be flush with the ground surface. A quick drying concrete slurry, which expands upon drying, is applied within the annulus between the soil vapor probe and the outer hole to seal the probe in place. The seal is allowed to cure for at least 24 hours prior to sampling.

Installing Soil Vapor Probes and Soil Vapor Sampling

Utility Locating

Prior to drilling and sampling, the presence of utilities in the area of the proposed soil vapor point(s) is evaluated by marking the location of the boring(s) in white paint or other method, and clearing the area through Underground Service Alert (USA). At each sampling location, a two to four-inch core is made in the surface pavement to allow access of the boring equipment.

Borehole Advancement and Probe Installation

The borehole is advanced to the desired sampling depth using a 6-inch diameter hand auger. The soil vapor probe is attached a length of Tygon® tubing that is at least two feet greater than the total depth of the borehole with a closed Swagelok® type valve attached to the opposite end. The vapor probe is set at a depth approximately 6 inches above the total depth of the borehole in a #3 Monterey Sand (or the equivalent) filter pack that is at a minimum of one foot thick. A half-foot thick layer of granulated bentonite is placed above the filter pack and hydrated. The soil vapor point is completed to the surface with neat cement grout mixed at a ratio of 6 gallons of water per 94 pounds of cement. A traffic rated is will be set in concrete, flush with the ground surface. The excess length of Tygon® tubing with the Swagelok® type valve is coiled up inside the well box.

Vapor Sampling

Soil vapor sampling is performed after a minimum time duration of 1 week, to allow the neat cement grout to cure, and to allow the subsurface vapor concentrations disturbed during installation activities to equilibrate. The sampling apparatus consists of two six-liter Summa canisters (one for vapor sample collection and one for system purging) connected via a manifold to a vacuum gauge, a ½-hour (100 to 200 ml/minute) flow regulator, and a filter. The sampling apparatus is assembled and a leak check performed prior to mobilization to the field. The leak checked is performed by closing the system at the down-hole side of the filter and opening the valve on the purge Summa canister. If the negative vacuum pressure of 30 inches of mercury (inHg) is maintained over a fifteen minute period, the apparatus passes the leak check. Once the sampling apparatus is assembled in the field, Tygon® tubing is attached to the down-hole side of the filter and connected to the Swagelok® type valve on the soil vapor sampling point. The apparatus is leak checked again. Once the apparatus passes the field leak check, the system is purged of three system volumes. The system volume is determined by adding together the volume of the airspace within the Tygon® tubing, the volume of the vapor well annulus airspace, and the volume of the airspace within the manifold, being careful to account for the volume of the vapor point within the filter pack material. This system volume is used to calculate the vacuum pressure drop that will occur during the purging of three system volumes, and can be divided by the flow rate of 200 ml/minute to derive the purge time.

The following equations are used to calculate the purge rate:

$$V_s = \left[\pi \left(\frac{D_i}{2} \right)^2 L \right] x + V_a + V_m$$

V_s = System Volume
D_i = Tubing Inner Diameter (in inches)
L = Tubing Length (in inches)
x = Conversion Constant (16.39 mL/in^3)
V_a = Annulus Volume
V_m = Manifold Volume

$$V_a = \left[\pi \left(\frac{Da}{2} \right)^2 h \, x \, \varphi \right] + 0.7(V_p)$$

V_a = Annulus Airspace Volume
D_a = Annulus Diameter
h = Annulus Height
x = Conversion Constant (16.39 mL/in^3)
φ = Porosity
V_p = Vapor Point Volume

$$t_p = \frac{V_s}{F}$$

t_p = Purge Time
V_s = System Volume
F = Flow Rate

$$\frac{V_i}{P_i} = \frac{V_s}{P_p}$$

V_i = Summa Canister Volume
P_i = Initial Summa Pressure
V_s = System Volume
P_p = Purge Pressure Drop

After the system purge, the soil vapor is collected by closing the valve on the purge Summa canister and opening the valve on the sampling Summa canister. The sampling start time is recorded on the field data sheet. Isopropyl alcohol (IPA), or the equivalent, is used as a leak check compound. A piece of gauze is attached to the down-hole side of the Swagelok® type valve and moistened with IPA, taking care not to apply the IPA directly to the tubing, valves, and fittings. The gauze is re-moistened with IPA every five minutes. After approximately one half hour, or when the vacuum pressure of the system reaches 5 inHg, the sampling canister valve is closed and the end time is recorded. Prior to sampling subsequent sample locations, the used tubing is discarded.

The sampling canister(s) and chain of custody is labeled with the site name, sampling ID, time and date of sampling, final vacuum pressure, and the canister serial number. The sampling canister(s) are shipped to a California certified laboratory for analysis.

Organic Vapor Procedures

Soil samples are collected for analysis in the field for ionizable organic compounds using a PID with a 10.2 eV lamp. The test procedure involves measuring approximately 30 grams from an undisturbed soil sample, placing this sub-sample in a Ziploc™-type bag or in a clean glass jar, and sealing the jar with aluminum foil secured under a ring-type threaded lid. The container is warmed for approximately 20 minutes (in the sun); then the head-space within the container is tested for total organic vapor, measured in parts per million as benzene (ppm; volume/volume). The instrument is calibrated prior to drilling. The results of the field-testing are noted on the boring logs. PID readings are useful for indicating relative levels of contamination, but cannot be used to evaluate petroleum hydrocarbon levels with the confidence of laboratory analyses.

Equipment Decontamination

Equipment that could potentially contact subsurface media and compromise the integrity of the samples is carefully decontaminated prior to drilling and sampling. Drill augers and other large pieces of equipment are decontaminated using high pressure hot water spray. Samplers, groundwater pumps, liners and other equipment are decontaminated in an

Alconox scrub solution and double rinsed in clean tap water rinse followed by a final distilled water rinse.

The rinsate and other wastewater are contained in 55-gallon DOT-approved drums, labeled (to identify the contents, generation date and project) and stored on-site pending waste profiling and disposal.

Soil Cuttings and Rinsate/Purge Water

Soil cuttings and rinsate/purge water generated during drilling and sampling are stored on-site in DOT-approved 55-gallon steel drums pending characterization. A label is affixed to the drums indicating the contents of the drum, suspected contaminants, date of generation, and the boring number from which the waste is generated. The drums are removed from the site by a licensed waste disposal contractor to an appropriate facility for treatment/recycling.

6:30 - 9:00 AM Drive Time to site

9:00 AM - Health & Safety Tailgate. Regulator, Dena Milano, onsite. He expressed concerns regarding precipitation in the past 5 days. Call to Adrian Perez in office to obtain precipitation records. For South SF Precipitation was: .14" 1/16/07, .02" 1/18/07 website reference is www.wunderground.com

Less than .25" for 5 day period. Based on fine grained lithology, surface cover of asphalt/concrete, vadose zone is not likely saturated.

10:00 AM - Initial pressure on VP-1 through VP-3 & PURGE-1 through PURGE-3 at -30.5 mmHg.

10:10 AM - 15 min. pressure check on VP/PURGE set up

10:15 AM - VP3/PURGE3 Failed vacuum check after 2 mins. Used 4th manifold

10:40 AM - All three (VP1/P1, VP2/P2, VP3/P3) systems passed vapor vacuum test.

10:55 AM - VP3/P3 : Initial Vac. -26 mmHg → Final Vac <-1 mmHg

11:02 AM - VP2/P2 : Initial Vac. -31 mmHg → Final Vac -4.5 mmHg

11:08 AM - VP1/P1 : Initial Vac. -30.5 mmHg → Final Vac -4.5 mmHg

11:29 AM - VP3 Sampling initiated -27 , 12:00 end -2

11:39 AM - VP1 Sampling initiated -30.5 , 12:10 end -4

11:41 AM - VP2 Sampling initiated -31.0 , 12:16 end -4.5

1245 - Sampling Complete. offsite

Drums - 18, 13 solid 5 liquid

1.0 INTRODUCTION

This report has been prepared by SECOR International, Inc. (SECOR) on behalf of the ConocoPhillips Company (ConocoPhillips) for a site assessment to evaluate the extent of petroleum hydrocarbons adsorbed to soil, dissolved-phase petroleum hydrocarbons in groundwater, and petroleum hydrocarbon vapor in subsurface soil at the property located at 402 South Delaware Street, San Mateo, California (the "Site"). SECOR submitted a work plan on December 5, 2005 to the San Mateo County Health Department – Groundwater Protection Program (SMCHD-GPP) addressing further assessment of the lateral and vertical extent of hydrocarbon-affected groundwater north, southeast, and south of the fuel UST cavity, and the potential vapor inhalation risk from hydrocarbon-affected groundwater in the southern half of the site. The SMCHD-GPP requested a revised work plan in their letter dated May 1, 2006 (Appendix A). SECOR submitted a *Revised Work Plan for Additional Site Assessment* on June 22, 2006. This revised work plan was conditionally approved by the SMCHD-GPP in their letter dated October 18, 2006 (Appendix A).

2.0 SITE BACKGROUND

2.1 Site Location

The 76 branded Service Station property (the "site") is located at 402 South Delaware Street, on the south corner of South Delaware Street and East Fourth Avenue in the City of San Mateo, San Mateo County, California (Figure 1). The site is bordered by South Delaware Street to the northeast, East Fourth Avenue to the northwest, and commercial buildings to the southwest and southeast. There are two active gasoline service stations located in the near vicinity: a Shell station on the north corner of East Third Avenue and South Delaware Street, and an ARCO station on the south corner of East Third Avenue and South Delaware Street. Historically, there used to be a Shell service station directly across South Delaware Street from the site on the east corner of South Delaware Street and East Fourth Avenue; a Jiffy Lube now exists at this location. Additionally, a former 76 branded service station was located on the west corner of East Third Avenue and El Dorado Street.

The site is an active service station dispensing 76 branded gasoline. The property is owned by Lucile G. Benedetti, whose contact information has been supplied to the SMCHD-GPP under separate cover. The station facilities include two unleaded gasoline underground storage tanks (USTs) located in a common pit in the southeast portion of the property, three product dispenser islands, and a station building (Figure 2). The USTs were installed at the site in August 1992 during station upgrade activities. A 550-gallon waste oil UST formerly located behind the station building was removed from the site when the current gasoline USTs were installed.

2.2 Site History

In August 1992, Kaprealian Engineering, Inc. (KEI) observed the removal of two 12,000-gallon capacity, fiberglass, gasoline underground storage tanks (USTs), one 505-gallon waste oil UST, and the associated product piping and dispensers. A 9-inch long crack was observed along the eastern end of the super unleaded gasoline UST upon removal. Subsequent petroleum hydrocarbon contamination was observed at the eastern end of the gasoline UST cavity. The cavity was over-excavated to remove as much of the impacted soil as possible, resulting in a final excavation that measured approximately 30 feet long by 27 feet wide by 22 feet deep. Initially, six soil samples were collected (A1, A2, B1, B2, SW1, and SW2) from the bottom and sidewalls of the UST cavity, one soil sample (WO1) was collected from the bottom of the waste oil UST cavity, and six soil samples (P1, P2, P3, P4, P5, and P6) were collected from the bottom of the product piping trenches. KEI returned at a later date to collect an additional three samples (SW1(2.5), SW2(2.5), and SW3) from the gasoline UST cavity and a grab water sample (W1). The water sample was collected after a total of approximately 5,800 gallons of water had been pumped form the gasoline UST cavity. The groundwater was observed to have floating product and a heavy sheen. Additionally, KEI collected three soil samples (D1, D2 , and D3) from beneath the gasoline dispensers. Laboratory analysis of soil samples collected from the gasoline UST cavity indicated the presence of up to 5,000 milligrams per kilogram (mg/kg) total petroleum hydrocarbons as gasoline (TPHg, B2), 47 mg/kg benzene (B2), 470 mg/kg toluene (B2), 120 mg/kg ethyl-benzene (B2), 790 mg/kg total xylenes (B2), and 5.9 mg/kg total petroleum hydrocarbons as diesel (TPHd, SW3). The requested petroleum hydrocarbon

constituents were not reported above laboratory detection limits in the soil samples collected from the product piping trenches and from beneath the gasoline dispensers. Laboratory analysis of the soil sample from the waste oil UST indicated the presence of the heavy metals cadmium, chromium, nickel, lead and zinc at concentrations of 1.1 mg/kg, 67 mg/kg, 73 mg/kg, 6.0 mg/kg, and 44 mg/kg, respectively, while the remaining petroleum hydrocarbon constituents were not indicated at concentrations above the laboratory detection limits. Analysis of the water sample collected from the gasoline UST indicated 28,000 micrograms per liter (µg/L) TPHd, 50,000 µg/L TPHg, 1,200 µg/L benzene, 6,700 µg/L toluene, 1,400 µg/L ethyl-benzene, and 10,000 µg/L total xylenes. Laboratory results are included in Table 1 (KEI, 1992).

In May 1994, KEI installed three monitoring wells (MW-1, MW-2 and MW-3) at the site (Figure 2). Laboratory analysis of the soil samples collected from the borings for monitoring wells MW-2 and MW-3 indicated the presence of TPHg and benzene, toluene, ethyl-benzene, and total xylenes (BTEX) at maximum concentrations of 2,600 mg/kg TPHg (MW2 at 17'), 26 mg/kg benzene (MW2 at 15'), 240 mg/kg toluene (MW2 at 15'), 62 mg/kg ethylbenzene (MW2 at 17'), and 410 mg/kg total xylenes (MW2 at 17'). The requested petroleum hydrocarbon constituents were not reported above laboratory detection limits in the soil samples collected form the MW-1 borehole. The wells were initially monitored and sampled in June 1994. Laboratory analysis of the water samples collected indicated the presence of petroleum hydrocarbons in MW-2 and MW-3, with maximum concentrations of 89,000 µg/L TPHg, 11,000 µg/L benzene, 37,000 µg/L toluene, 3,000 µg/L ethyl-benzene, and 20,000 µg/L total xylenes reported in MW-2. The depth to water ranged from 15.33 to 16.71 feet below ground surface (bgs), with the evaluated groundwater gradient being approximately 0.004 foot/foot to the east. KEI concluded to follow a three month monitoring program, at which point the wells would be re-sampled. Laboratory results are included in Tables 1 and 2 (KEI, 1994).

In March 1995, two additional monitoring wells (MW-4 and MW-5) were installed in offsite locations in the sidewalk along the opposite side of South Delaware Street form the site (Figure 2). The offsite wells were located in the downgradient direction from the site. Laboratory analysis of the soil samples collected from the monitoring well boreholes indicated the presence of TPHg and BTEX at maximum concentrations of 600 mg/kg TPHg, 3.3 mg/kg benzene, 38 mg/kg toluene, 14 mg/kg ethylbenzene, and 96 mg/kg total xylenes in soil sample MW4 at 5'. The new wells were added to the quarterly groundwater monitoring and sampling program, and were first sampled in April 1995. Laboratory analysis of the water samples collected from MW4 and MW5 indicated the presence of maximum concentrations of 150,000 µg/L TPHg, 12,000 µg/L benzene, 40,000 µg/L toluene, 4,700 µg/L ethyl-benzene, and 31,000 µg/L total xylenes reported in MW-4. Laboratory results are included in Tables 1 and 2 (KEI, 1995).

In January 1996, GeoStrategies (GSI) observed the excavation and removal of a 150 gallon capacity oil/water separator. A confirmation soil sample (OWS-S-4.5) was collected from underneath the oil/water separator at a depth of 4.5 feet bgs. Laboratory analysis of the sample indicated the presence of trace concentrations of TPHd, toluene, and total xylenes at 1.5 mg/kg, 0.006 mg/kg, and 0.009 mg/kg, respectively. Additionally, the presence of the heavy metals chromium, nickel, lead, and zinc were indicated at concentrations of 160 mg/kg, 99 mg/kg, 13 mg/kg, and 69 mg/kg, respectively. The remaining requested petroleum hydrocarbon constituents were not reported above laboratory detection limits. Laboratory results are included in Table 1 (GSI, 1996).

In February 1996, KEI supervised the advancement of three Geoprobe® soil borings (SP1, SP2, and SP4) at offsite locations (Figure 2). The soil borings were terminated at a depth of 13 feet bgs, with groundwater encountered at approximately 10.5 feet bgs. Grab water samples were collected from each borehole. Laboratory analysis of the water samples indicated the presence of TPHg, benzene, ethylbenzene, and total xylenes in the sample from boring SP-4 at concentrations of 450 µg/L, 71 µg/L, 6.7 µg/L, and 17 µg/L, respectively. The requested petroleum hydrocarbon constituents were not reported above laboratory detection limits in the groundwater samples from borings SP-1 and SP-2. A summary of laboratory results is included in Table 2 (KEI, 1996).

The site has been monitored and sampled since the second quarter 1994. From 1994 to 2000, the site was monitored on a quarterly basis. Since 2001, the frequency has been reduced to semi-annual monitoring and sampling. Historically, the highest dissolved phase petroleum hydrocarbon concentrations have occurred in wells MW-2 and MW-3. The groundwater gradient has been mainly to the east and southeast (SECOR, 2006). Laboratory results are included in Table 2.

Historical soil and groundwater sampling locations are shown on Figure 2, and historical soil, groundwater, and gradient data are summarized in Tables 1 through 3 and Figure 3.

3.0 SCOPE OF WORK

On December 14 and 15, 2006, SECOR field staff observed Gregg Drilling and Testing, Incorporated (Gregg) of Martinez, California, advance four direct push soil borings (SP-5, SP-6 SP-7, and SP-8). On December 27, 2006, SECOR field staff observed Vironex of San Leandro, California, install three soil vapor wells (VP-1, VP-2, and VP-3) and one subslab soil vapor probe (SUBSLAB). From January 2 through 4, 2007, SECOR field staff observed Gregg install four groundwater monitoring wells (MW-6, MW-7, MW-8, and MW-9) and destroy four groundwater monitoring wells (MW-1, MW-2, MW-3, and MW-5) using hollow stem auger (HSA). On February 2, 2007, SECOR field staff observed Vironex reinstall the subslab soil vapor probe. The soil boring, monitoring well, and soil vapor well locations are illustrated on Figure 2. The completed scope of work is discussed below.

3.1 Site Health and Safety Plan

As required by the Occupational Health and Safety Administration Standard "Hazardous Waste Operations and Emergency Response" guidelines (29 CFR 1910.120), and by the California Occupational Health and Safety Administration "Hazardous Waste Operations and Emergency Response" guidelines (CCR Title 8, Section 5192), SECOR updated the current site-specific Health and Safety Plan (HASP) prior to the commencement of fieldwork. The HASP was reviewed by field staff and contractors before beginning field operations, and was in the possession of SECOR personnel while conducting work activities at the site.

3.2 Permitting

Prior to site assessment activities, SECOR applied for an encroachment permit from the City of San Mateo Department of Public Works (CSMDPW) for the advancement of soil borings SP-5, SP-6, SP-7, and SP-8, the destruction of monitoring well MW-5, and the installation of monitoring well MW-8. The CSMDPW encroachment permit was approved on December 14, 2006. SECOR also applied for subsurface drilling permits from the SMCHD-GPP, and these permits were granted on December 5, 2006. Copies of the permits are included in Appendix A.

3.3 Subsurface Utility Clearance

Prior to initiating field activities, SECOR marked the boring locations, contacted Underground Service Alert (USA) 48 hours prior to the initiation of field work, and contracted a private utility locator to investigate whether the proposed boring locations were clear of potential subsurface obstructions. Under the direction of SECOR field staff, the private utility locator identified an anomalous metallic signal in the vicinity of SP-6, and recommended moving the borehole either onsite, or into the second lane of traffic. The boring was moved onsite to prohibit the impedance of traffic on South Delaware Street. The private utility locator also identified an anomalous metallic signal in the vicinity of soil borings SP-5 and SP-7. The utility locator recommended moving SP-5 to the left northbound lane of South Delaware Street and recommended moving SP-7 to the center of East Fifth Avenue. SECOR discussed the new locations with traffic control, and both accepted the new location of the boreholes. The surface markings made by the utility companies contacted as member services of USA indicated that SECOR could not advance soil boring SP-8 and monitoring well MW-8 due to the presence of

subsurface utilities. SECOR instructed the private locator to determine the depth of the utility and the private locator determined the utility was marked incorrectly. SECOR contacted the USA member to remark the location. The USA member determined the utility was incorrectly marked the first time and correctly marked the utility. Soil boring SP-8 was in a location cleared for utilities. The location for monitoring well MW-8 was moved from the street to the sidewalk area which was cleared by both the private locator and the members of USA. The USA markings were corroborated by the private utility locator. The private utility locator did not identify potential subsurface obstructions at the locations for monitoring wells MW-6, MW-7, and MW-9, for soil vapor wells VP-1, VP-2, and VP-3, or the sub-slab vapor probe.

In order to decrease the chance of damaging an unidentified subsurface utility line, it is ConocoPhillips policy to use a pressurized air lance and vacuum to remove the top five feet of subsurface material. Soil borings SP-5 through SP-8 and MW-6 through MW-9 were cleared to a depth of 5 feet bgs using an air lance and vacuum truck prior to commencement of mechanical drilling. Additionally, the annulus materials surrounding wells MW-2 and MW-5 were cleared to a depth of 5 feet bgs.

The private utility locator identified electrical lines adjacent to groundwater monitoring wells MW-1 and MW-3. The distance between the lines and the monitoring wells was such that the wells could not be destroyed by over drilling, as stated in the work plan. These two wells were destroyed following the SMCEHD protocol for pressure grouting.

SECOR's field procedures are included in Appendix B.

3.4 Direct Push Soil Borings

On December 14 and 15, 2006, four soil borings (SP-5, SP-6, SP-7, and SP-8) were advanced. Soil boring SP-5 was advanced in the left northbound lane on South Delaware Street approximately 50 feet northwest of the intersection of South Delaware Street and East Fifth Avenue; soil boring SP-6 was advanced onsite approximately 12 feet northwest of the northeast dispenser island canopy; and soil borings SP-7 and SP-8 were advanced on East Fifth Avenue, approximately 88 feet southwest and approximately 87 feet northeast of the intersection of East Fifth Avenue and South Delaware Street, respectively (Figure 2).

The soil borings were advanced to depths of 28 feet bgs (SP-6), 30 feet bgs (SP-5 and SP-8), and 34 feet bgs (SP-7). Dual wall, direct push Geoprobe was utilized for soil boring SP-5 to a depth of 24 feet. Single wall, direct push Geoprobe casing was utilized for the remaining 6 feet in soil boring SP-5 and the total depths of soil borings SP-6, SP-7 and SP-8, because a possible shallow saturated zone between 5 and 15 feet bgs was not encountered. Groundwater was first observed in borings SP-5 and SP-8 at a depth of 20 feet bgs, in soil boring SP-6 at a depth of 21 feet bgs and in soil boring SP-7 at a depth of 32 feet bgs. Groundwater stabilized at depths between approximately 15 and 15.5 feet. SECOR's field procedures are included in Appendix B.

3.5 Soil Vapor Well Installation

On December 27, 2006, three soil vapor wells (VP-1, VP-2, and VP-3) were installed. Soil vapor wells VP-1 and VP-2 were advanced south of the UST pit, and soil vapor well VP-3 was

advanced north of the UST pit (Figure 2). The boreholes for the soil vapor wells were advanced using a 6-inch diameter hand auger to depths of 5.5 feet bgs (VP-2), and 6 feet bgs (VP-1 and VP-3). The soil vapor wells were completed by holding the vapor probe tip (attached to 8 feet of Tygon tubing) 6 inches above the bottom of the borehole and emplacing a #3 Monterey sand filter pack that extended 6 inches below and 6 inches above the probe. A six-inch hydrated bentonite seal was placed above the sand, and neat cement grout was placed above the bentonite seal to approximately six inches bgs. The probes were completed at the surface with a well box and concrete dyed to match existing grade. A Swagelok fitting was place on the end of the Tygon tubing, and was turned to the closed position during the construction of the soil vapor well.

SECOR's field procedures are included in Appendix B.

3.6 Subslab Vapor Probe Installation

On December 27, 2006, a subslab vapor probe (SUBSLAB) was installed in the southeast corner of the station building, inside the auto repair bay (Figure 2). A 1/8-inch diameter, 6-inch long, stainless steel tube with a ½-inch diameter Swagelok compression fitting attached to the top was used to create the soil vapor probe. Spacer fittings were installed between the Swagelok fitting and the tubing to allow for the cement seal. The probe was assembled by Vironex after arrival at the site. A ¼-inch diameter inner hole was advanced to a depth of approximately 3 inches below the concrete building slab, and the cuttings were removed with a vacuum. A 1.5-inch diameter outer hole was advanced along the centerline of the inner hole to a depth of approximately 4.5 inches into the concrete slab. The probe was set in the inner hole and a cement seal was emplaced so as not to contact the Swagelok fitting. SECOR emplaced putty over the probe to protect it from foot traffic in the garage area.

When SECOR personnel returned to sample the subslab probe on February 1, 2007, the Swagelok fitting on the probe was loose. SECOR returned with Vironex on February 2, 2007 to remove the subslab vapor probe, tighten the Swagelok fitting, and reinstall the probe in the same location.

A schematic of the soil vapor probe is included as Figure 4. SECOR's field procedures are included in Appendix B. Concrete cuttings generated during the installation of the soil vapor probe were disposed of by Vironex as construction waste.

3.7 Groundwater Monitoring Well Installation

From January 2 to 4, 2007 four groundwater monitoring wells (MW-6, MW-7, MW-8, and MW-9) were installed using a HSA rig equipped with 8-inch diameter auger flights. Monitoring well MW-6 was installed near the location of destroyed monitoring well MW-2, monitoring well MW-7 was installed in the southern corner of the site, monitoring well MW-8 was installed on the east corner of South Delaware Street and East Fourth Avenue, and monitoring well MW-9 was installed near the location of destroyed monitoring well MW-1 (Figure 2). The groundwater monitoring well borings were advanced to a depth of 20 feet bgs for MW-6, 26.5 feet bgs for MW-7, 30 feet bgs for MW-8, and 17 feet bgs for MW-9. Groundwater was first encountered at 15.9 feet bgs in MW-6, 22 feet bgs in MW-7, 18 feet bgs in MW-8, and 14.7 feet bgs in MW-9. Groundwater stabilized at depths between approximately 13 and 18 feet bgs.

The monitoring wells were constructed using 2-inch diameter poly vinyl chloride (PVC) casing with a 0.020-inch slotted screen interval extending from 13 to 19 feet bgs for MW-6, 22 to 25 feet bgs for MW-7, 17 to 30 feet bgs for MW-8, and 11.5 to 15 feet bgs for MW-9. A filter pack of #3 Monterey sand was placed in the annulus across from the screen and 1 to 2 feet above the screen. A 2 to 3 foot thick bentonite seal (hydrated chips) was placed above the sand pack. Neat cement grout (mixed at a ratio of 6 gallons of water per 94 pounds of Portland cement) was tremmied from the top of the bentonite seal to 1 foot bgs. The wells were completed at the surface with a traffic rated well box set in concrete dyed to match the existing grade, and a locking well cap was placed on the casing. The well materials were tremmied through the annulus of the HSA flights. Because a potential aquitard was encountered at the bottom of the boreholes for monitoring wells MW-6, MW-7, and MW-9, a bentonite seal was emplaced within this fine-grained material at the bottom of each of these three boreholes prior to well construction. These potential aquitards were not penetrated through during the drilling operations.

SECOR's field procedures are included in Appendix B. Boring logs illustrating well construction details are included in Appendix C.

3.8 Grab Groundwater Sample Collection and Analysis

Grab groundwater samples were collected from soil borings SP-5 through SP-8. The groundwater samples were collected by lowering a disposable bailer through the annulus of the direct push casing. The samples were transferred from the bailers, using a low-flow control spigot, into 40 milliliter (ml) volatile organic analyte (VOA) vials preserved with hydrochloric acid (HCl). The VOAs were placed on ice, and submitted to a California certified laboratory to be analyzed for the presence of total purgeable petroleum hydrocarbons (TPPH); BTEX; MTBE; ethanol, TBA, tertiary amyl methyl ether (TAME), di-isopropyl ether (DIPE), ethyl tertiary butyl ether (ETBE), ethylene dibromide (EDB), and 1,2-dichloroethane (1,2-DCA) by EPA Method 8260B.

3.9 Soil Sample Collection and Analysis

The direct push soil borings were sampled continuously, and the monitoring well borings were sampled every 5 feet, or more frequently to continuously as necessary to investigate soil stratigraphy, using a modified California sampler. The borings were described in accordance with the Unified Soil Classification System (USCS) by a SECOR scientist under the direction of a California Professional Geologist. Soil samples from the direct push soil borings were contained in Teflon® liners that were inserted into the sample collection rod. Soil samples from the monitoring well borings were contained in 2 inch diameter by 6 inch long brass sleeves that were inserted into the modified California sampler. Soil samples were examined for odors, visible signs of petroleum hydrocarbons, and screened for hydrocarbon vapors using a photo-ionization detector (PID). Samples were submitted for analysis from above the water bearing zone, potential aquitards at the bottom of the borings, depths of previously known impact, and if elevated hydrocarbon vapors were detected from that approximate depth using the PID. The soil samples were placed on ice and submitted to a California certified laboratory to be analyzed for the presence of TPPH; BTEX; MTBE; ethanol, TBA, TAME, DIPE, ETBE, EDB, and 1,2-DCA by EPA Method 8260B.

Boring logs are included in Appendix C.

3.10 Soil Boring Borehole Completion

Upon completion of groundwater sampling, each soil boring borehole was backfilled with neat cement grout. In accordance with SMCHD-GPP guidelines, the grout was mixed at a ratio of 6 gallons of water per 94 pounds of Portland cement, and was introduced into the borehole through a tremmie pipe to displace standing water in the hole. A cement cap was placed at the surface of soil borings SP-6 and SP-8 to match the existing grade. An asphalt cold patch cap was placed at the surface of soil borings SP-5 and SP-8.

3.11 Monitoring Well Development, Sampling, and Analysis

On January 9, 2007, SECOR personnel developed the newly installed monitoring wells MW-6 through MW-9. Approximately 10 casing volumes were purged from wells MW-6 and MW-8, approximately 12 casing volumes were purged from well MW-7, and approximately 34 casing volumes were purged from well MW-9. The last three successive measurements of temperature, conductivity, and pH of the purged groundwater varied by ≤10%, ≤3%, and ≤0.1, respectively.

On January 26, 2007, SECOR personnel purged and sampled groundwater monitoring wells MW-4 and MW-6 through MW-8, using low-flow protocol at a flow rate of less than 200 milliliter (mL) per minute using a bladder pump. Due to the small amount of groundwater in groundwater monitoring well MW-9, a peristaltic pump was used to purge and sample the water at a flow rate of less than 100 mL per minute. The pump intakes were placed at depths in the water column that were opposite the portion of the saturated zone expected to contain the greatest hydrocarbon impact. Criteria for this selection included the depth of the highest soil impact encountered during well installation, the as-built screen interval, and the recorded depth to water. The pump intake was placed at 15 and 17 feet deep in MW-4 and MW-6, respectively (depths of highest soil impact), at the top of the screened interval in wells MW-7 and MW-8 (because there was no detected soil impact and the screens were submerged), and at the only depth possible due to minimal water encountered in MW-9. The conductivity, temperature, and pH of the delivered effluent were monitored every three to five minutes using a flow-through cell during purging and recorded on the field data sheets. Purging ended once three successive measurements of pH, conductivity, and temperature of the purged water stabilized to within 0.1, 3%, and 10%, respectively.

Following monitoring well purging, groundwater samples from wells MW-4, MW-6, MW-7, and MW-8 were collected using a low-flow bladder pump, and the groundwater sample from well MW-9 was collected using a peristaltic pump. Each groundwater sample was discharged from the pump tubing, after disconnecting the tubing from the inlet of the flow-through cell, into 40-mL VOAs preserved with HCl. The VOAs were placed on ice, and submitted to a California certified laboratory to be analyzed for the presence of TPPH, BTEX, MTBE, and tetrachloroethene (PCE) by EPA Method 8260B.

Field data sheets illustrating onsite activities, including system or line volumes, actual purge volumes, purging equipment, and sampling equipment used, are included in Appendix D.

3.12 Groundwater Monitoring Well Destruction

On January 2 and 3, 2007, four groundwater monitoring wells (MW-1, MW-2, MW-3, and MW-5) were destroyed. Due to the close proximity of underground electric lines, groundwater monitoring wells MW-1 and MW-3 were destroyed following SMCEHD guidelines for pressure grouting. Neat cement grout (mixed at a ratio of 6 gallons of water per 94 pounds of Portland cement) was tremmied into the well from the bottom up to displace standing groundwater in the well. A pressure fitting was attached to the top of the well casing and 25 pounds per square inch (psi) pressure was applied to the grout column inside the well casing for approximately 5 minutes. The well box and the upper foot of the well casing were removed prior to surface completion with concrete, dyed to match the existing grade. Groundwater that was displaced from the borehole during pressure grouting was contained and managed as site waste. Groundwater monitoring wells MW-2 and MW-5 were destroyed by over drilling, and were cleared to 5 feet bgs using an air lance and vacuum truck prior to mechanical drilling. From 5 feet bgs to the well terminus, the groundwater monitoring wells were drilled using 8-inch diameter HSA, and the well casing and annular materials were removed. The destroyed monitoring well boreholes were backfilled using neat grout cement (mixed at a ratio of 6 gallons of water per 94 pounds of Portland cement), tremmied from the bottom of the borehole to approximately 1 foot bgs. The boreholes were completed at the top using concrete dyed to match the existing grade.

SECOR's field procedures are included in Appendix B.

3.13 Monitoring Well Surveying

On January 16, 2007 SECOR observed Morrow Surveying, Inc. (Morrow) survey soil borings SP-5 through SP-8, newly installed monitoring wells MW-6 through MW-9, and soil vapor wells/probe VP-1 through VP-3 and SUBSLAB. The borings and wells were surveyed for geographical location to the NAD 83 (1986) Datum, and for elevation to the NAVD 88 Datum from geo-positioning satellite (GPS) observations. A copy of the Morrow survey map is included in Appendix E.

3.14 Groundwater Gradient Evaluation

On January 26, 2007, SECOR field staff collected depth to water measurements prior to the purging and sampling of groundwater monitoring wells MW-4 and MW-6 through MW-9. These depths to water were used to calculate groundwater elevations and evaluate the groundwater gradient. The groundwater gradient was evaluated to flow to the east at a magnitude of 0.003 foot per foot (Figure 5). This groundwater gradient is consistent with historical gradients that have been evaluated at the site (Table 3, Figure 3).

3.15 Soil Vapor Sample Collection and Analysis

On January 19, 2007, SECOR performed soil vapor sampling. Prior to sampling, SECOR field personnel verified that there had not been a significant precipitation event within the previous 5 days. It was determined that 0.14 inches of rain fell on January 16, 2007 and 0.02 inches of rain fell on January 18, 2007 by referencing www.wunderground.com. According to the

Department of Toxic Substances Control (DTSC) and California Regional Water Quality Control Board – Los Angeles Region (LARWQCB) Advisory dated January 28, 2003 "A. Wet Conditions: If no-flow or low-flow conditions are caused by wet soils, the soil gas sampling should cease. In addition, the Agency recommends that the soil gas sampling should not be conducted during or immediately after a significant rain even (e.g., ½ inch or greater) or onsite watering." Precipitation onsite was less than ½ inch in the past five days, so SECOR continued with the soil vapor sampling.

While performing a 15-minute leak test on the canisters and manifolds, one of the four manifolds would not hold a vacuum pressure. Field personnel decided to sample the three external soil vapor wells and return at a later date to sample the subslab vapor probe. SECOR returned to the site on January 26, 2007 to sample the subslab vapor probe. Soon after SECOR field personnel arrived on site it began to precipitate. The rate of precipitation was great enough to be considered a significant event, and soil vapor sampling was not performed. SECOR returned to the site on February 1, 2007 to perform additional sampling of soil vapor wells VP-1, VP-2, and VP-3, and to sample the subslab soil vapor probe. The Swagelok fitting on the subslab soil vapor probe was loose, indicating that a proper seal had not been created during the installation of the probe. Once the probe was reinstalled on February 2, 2007, SECOR field staff returned to the site on February 6, 2007 to sample the subslab probe.

During sampling events the summa canisters were received from the laboratory with the proper negative vacuum pressure of approximately -30.5 to -31 millimeters of Mercury (mmHg), a ½-hour flow regulator (airflow at 200 milliliters per minute) was used, the manifold system passed the 15 minute leak check, a purge was performed to remove approximately 5 liters (a 26.5 change in vacuum pressure) of sub-surface vapors from the soil vapor probes VP-1, VP-2, and VP-3, and isopropyl alcohol was applied to the Tygon tubing connections at intervals of approximately 5 minutes. The change in vacuum pressure to purge three systems volumes was calculated prior to arrival in the field, using a tubing inner diameter measurement of 0.25 inches, an assumed porosity of 30% airspace, and the tubing lengths and annulus measurements listed earlier in this report. The sampling interval on January 26, 2007 was between 31 minutes (VP-3) and 35 minutes (VP-2) and on February 1, 2007 was between 43 minutes (VP-1) and 46 minutes (VP-2). During the SUBSLAB sampling event, the summa canisters were received with a proper negative vacuum pressure of approximately -30.25 and -30.5 mmHg, a ½ hour flow regulator was used, the manifold system passed a 15 minute leak check, a purge was performed to remove 2 liters of sub-surface vapors from the probe, and isopropyl alcohol was applied to the Tygon tubing connections at intervals of approximately 5 minutes. The sampling interval was 14 minutes. A schematic of the Sub Slab soil vapor sampling apparatus is included as Figure 6. SECOR's field procedures, including purge calculations, are included in Appendix B. Copies of the field notes collected during sampling are included in Appendix D.

The soil vapor samples were sent under chain-of-custody documentation to AirToxics Ltd., a California-state certified laboratory in Folsom, California. The samples were analyzed for the presence of total gasoline range petroleum hydrocarbons by Environmental Protection Agency (EPA) Method TO-3; benzene, toluene, ethylbenzene, xylenes, MTBE, TBA, 1,2-DCA, ethyl tertiary butyl ether, tertiary amyl methyl ether, isopropyl ether, ethylene dibromide, ethanol, 1,3-dichlorobenzene, 1,4-dichlorobenzene, and isopropyl alcohol (IPA, or 2-propanol) by EPA Method TO-14A; and the atmospheric gases oxygen (O_2), methane (CH_4), and carbon dioxide (CO_2) by ASTM D-1946. Laboratory reporting limits for the atmospheric gases were set at

reporting limits less than or equal to ambient concentrations, and were set at ≤100 micrograms per cubic meter (µg/m3) for IPA.

3.16 Investigation Derived Waste

Soil cuttings, decontamination rinsate, and purge water generated during the site assessment activities performed between December 14, 2006 and January 26, 2007 were stored in 19 Department of Transportation (DOT) approved 55-gallon capacity steel drums (13 containing soil and 6 containing waste water). These drums were staged onsite pending laboratory characterization as non-hazardous waste. Filter Recycling Services (FRS) of Colton, California transported the drums to their licensed facility in Rialto, California for disposal on February 14, 2007. The waste disposal documentation is included as Appendix F.

4.0 FINDINGS

4.1 Subsurface Conditions

Subsurface materials encountered at the site generally correlated well with those previously reported, as shown on the geologic cross sections, Plate 1, and boring logs, Appendix C. Silt with some silty sand and gravel intervals was encountered from the ground surface to depths of approximately 5 to 16 feet bgs. This silt was underlain by silty sand and gravel with minor silt interbeds to approximate depths of 15 to 25 feet bgs. Wells MW-4, MW-6, MW-7, MW-8, and MW-9 appear to be screened in this first water bearing zone ranging between the approximate depths of 10 and 25 feet bgs. Beneath this water-bearing zone, a silt aquitard varying in thickness from approximate 1.5 to 14 feet thick was encountered. This aquitard was relatively continuous, except in the area of wells MW-4 and MW-8, which may be within a channel deposit. The aquitard was underlain by a deeper water-bearing zone beginning at the approximate depths of 18 feet bgs in the site area and east of the site, and 32 feet bgs southeast of the site (SP-7). The bottom of this deeper water-bearing zone was not encountered.

When SECOR first mobilized to the site in December 2006 to drill the Geoprobe borings, water was not encountered in the shallow water-bearing zone, enabling grab sampling of the groundwater in the deeper water bearing zone. SECOR anticipated drilling wells into this deeper water-bearing zone during the second mobilization less than three weeks later; however, upon the second mobilization, groundwater was present in the shallower water-bearing zone.

4.2 Soil Analytical Results

A total of 34 soil samples were submitted for laboratory analysis from soil borings SP-5, SP-6, SP-7, SP-8, MW-6, MW-7, MW-8, and MW-9. Analytical results indicated the presence of up to 1,300 milligrams per kilogram (mg/kg) TPPH (MW-6@16.5-17), 0.18 mg/kg benzene (MW-6@11-11.5), 32 mg/kg toluene (MW-6@11-11.5), 20 mg/kg ethylbenzene (MW-6@11-11.5), 110 mg/kg total xylenes (MW-6@11-11.5), and 0.089 mg/kg MTBE (MW-6@19.5-20). The remaining requested petroleum hydrocarbon constituents were not detected above the laboratory reporting limits.

Soil analytical results are summarized in Table 4 and included in Table 1. The laboratory reports with certified analytical results and chain-of-custody documentation are included in Appendix G.

4.3 Groundwater Analytical Results

Nine groundwater samples were submitted for laboratory analysis from soil borings SP-5, SP-6, SP-7, and SP-8, and monitoring wells MW-4, MW-6, MW-7, MW-8, and MW-9. Grab sample analytical results indicated the presence of up to 51,000 µg/L TPPH (SP-8), 1,300 µg/L benzene (SP-5), 1,500 µg/L toluene (SP-5), 1,500 µg/L ethylbenzene (SP-5), 9,600 µg/L total xylenes (SP-8), and 330 µg/L MTBE (SP-5). Groundwater samples from the wells contained petroleum hydrocarbons in MW-6 (67,000 µg/L TPPH, 380 µg/L benzene, 8,600 µg/L toluene, 3,600 µg/L ethylbenzene, 17,000 µg/L total xylenes, and 62 µg/L MTBE), and MW-9 (0.73 µg/L xylenes).

The remaining requested petroleum hydrocarbon constituents were not detected above the laboratory reporting limits.

Due to anomalous laboratory results during the third quarter 2006 groundwater sampling event in the TPPH range, SECOR requested that the groundwater samples be analyzed for the presence of PCE. Laboratory results indicated that analytical results within the TPPH range for four of the five site wells (MW-4, MW-7, MW-8, and MW-9) were due to the presence of PCE in the groundwater, and not the presence of petroleum hydrocarbons.

Groundwater analytical results are summarized in Table 5, and included on Table 2. The laboratory reports with certified analytical results and chain-of-custody documentation are included in Appendix G.

4.4 Soil Vapor Analytical Results

Laboratory analysis of the soil vapor samples collected from wells VP-1, VP-2, and VP-3 on January 19, 2007 indicated the presence of 0.75 µg/m^3 TPPH (VP-3), up to 16 µg/m^3 toluene (VP-1), 14 µg/m^3 ethylbenzene (VP-3), 42 µg/m^3 m,p-xylenes (VP-3), and 29 µg/m^3 o-xylenes (VP-3). The laboratory analysis additionally indicated that the samples were composed of 21-22% O_2 and 0.46-0.98% CO_2. The remaining requested compounds were not reported at concentrations greater than the laboratory reporting limits. IPA was not detected above the laboratory reporting limits in the soil vapor samples.

Laboratory analysis of the soil vapor samples collected from wells VP-1, VP-2, and VP-3 on February 1, 2007 indicated the presence of 0.27 µg/m^3 TPPH (VP-3), 5.4 µg/m^3 toluene (VP-1), 5.8 µg/m^3 ethylbenzene (VP-3), 7.8 µg/m^3 m,p-xylenes (VP-3), and 12 µg/m^3 o-xylenes (VP-3). The laboratory analysis additionally indicated that the samples were composed of 20-21% O_2 and 0.52-1.0% CO_2. The remaining requested compounds were not detected at concentrations greater than the laboratory reporting limits. IPA was detected at a concentration of 12 µg/m^3 in the vapor sample collected from well VP-3.

For comparison purposes, the environmental screening level (ESL), as established by the state of California Regional Water Quality control Board (CRWQCB), for TPPH in shallow soil gas is 26,000 µg/m^3. This ESL is for residential land use, which is stricter than the ESL for commercial/industrial land use. The residential ESL for TPPH in indoor air is 26 µg/m^3. The commercial ESLs for shallow soil gas and indoor air are 72,000 µg/m^3 and 36 µg/m^3, respectively (CRWQCB, 2005). The atmospheric gases O_2, CH_4, CO_2 exist in nature at approximately 20.95%, 0.00017%, and 0.0360%, respectively (Pidwirny, 2006).

Soil vapor analytical results are summarized in Table 6. The laboratory reports with certified analytical results and chain-of-custody documentation are included in Appendix G.

4.5 Geotracker Upload

Data associated with this assessment report has been uploaded to the California State Geotracker database. Confirmation of this electronic submittal is included in Appendix H.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Excavation has been performed at the eastern end of the tank pit and hydrocarbons in soil appear to be adequately delineated by borings MW-1, MW-7, MW-8, MW-9, SP-5, SP-6, and SP-7.

The groundwater gradient evaluated from the newly constructed wells discreetly screened in the shallow water-bearing zone is consistent with previous gradients. This is likely due to the seasonal presence of groundwater in the shallow water-bearing zone, and hydraulic connection between the two water bearing zones in the area of MW-4 and possibly MW-8.

The lateral extent of dissolved-phase hydrocarbons in shallow groundwater is delineated to the northwest, northeast, and southwest (upgradient and crossgradient) by wells MW-9, MW-8, and MW-7. SECOR recommends a downgradient well in the shallow water-bearing zone to delineate the lateral extent of dissolved-phase hydrocarbons in this zone.

The lateral extent of dissolved-phase hydrocarbons in deeper groundwater is delineated to the southwest (crossgradient) by SP-7. Concentrations of dissolved phase petroleum hydrocarbons in offsite soil borings SP-5 and SP-8 indicate that further downgradient delineation of the dissolved phase hydrocarbon plume in the deeper water-bearing zone is warranted. SECOR proposes to perform further offsite assessment to install downgradient wells along East Fifth Avenue and Delaware Street. Wells in the deeper water-bearing zone will also be necessary northwest and northeast of the site for gradient evaluation and delineation of hydrocarbons in this zone. SECOR recommends drilling these deeper zone wells during the summer or fall to avoid the necessity for conductor casing.

Due to previous detections of PCE in the groundwater, analysis for PCE and historical research of properties in the vicinity of the site to investigate a potential source of the solvent PCE should be performed.

The two separate soil vapor well sampling events showed good correlation between the analytical results. The gases (O_2, CH_4, and CO_2) did not show deviations between events, and were within an acceptable deviation of percentages found in the atmosphere. The maximum concentrations of toluene (16 µg/m^3), ethylbenzene (14 µg/m^3), and xylenes (42 µg/m^3) reported were less than or approximately 0.01 percent of the commercial land use shallow soil gas ESLs of 180,000 µg/m^3 toluene, 1,200,000 µg/m^3 ethylbenzene, and 410,000 µg/m^3 xylenes, and less than 0.1 percent of the residential land use ESLs of 63,000 µg/m^3 toluene, 420,000 µg/m^3 ethylbenzene, and 150,000 µg/m^3 xylenes (CRWQCB, 2005). Additionally, the maximum concentration of TPPH reported (0.75 µg/L, or 750 µg/m^3) was approximately 1 percent of the commercial land use shallow soil gas ESL of 72,000 µg/m^3 , and less than 3 percent of the residential land use shallow soil gas ESL of 26,000 µg/m^3. IPA was detected in the soil vapor sample from VP-3 during the second round of sampling. An overall decrease in the petroleum hydrocarbon compounds between sampling events in vapor well VP-3 could have been caused by a small leak in the sampling apparatus; however, the reported concentration of IPA (12 µg/m^3) was negligible, and the concentrations reported during the sampling event without evidence of a leak were below ESLs. The subslab soil vapor sample did not contain petroleum hydrocarbon compounds at concentrations greater than the laboratory limits. IPA was reported

in the subslab soil vapor sample, but the concentration does not indicate that large enough leak occurred to dilute the sample. None of the petroleum hydrocarbon compounds detected were at levels above the residential shallow soil gas ESLs. SECOR does not believe that vapor inhalation is an exposure pathway at the site due to the low concentrations of gaseous petroleum hydrocarbons at a depth of approximately 5 feet bgs, and that subsurface material between the surface and the depth of sampling (silt) most likely acts as a barrier to the migration of soil vapor.

6.0 LIMITATIONS

This report was prepared in accordance with the scope of work outlined in SECOR's contract and with generally accepted professional engineering and environmental consulting practices existing at the time this report was prepared and applicable to the location of the site. It was prepared for the exclusive use of ConocoPhillips Company and its representatives, for the express purpose stated above. Any re-use of this report for a different purpose or by others not identified above shall be at the user's sole risk without liability to SECOR. To the extent that this report is based on information provided to SECOR by third parties, SECOR may have made efforts to verify this third party information, but SECOR cannot guarantee the completeness or accuracy of this information. The opinions expressed and data collected are based on the conditions of the site existing at the time of the field investigation. No other warranties, expressed or implied are made by SECOR.

1 Analyzed by EPA Method 3550/8015M
2 Analyzed by Standard Method 5520 E&F (Gravimetric)
3 Analyzed by EPA Method 5030/8015M between 8/1992 and 3/1995; by EPA Method 8260 between 12/2006 and the present.
4 Analyzed by EPA Method 8020 between 8/1992 and 3/1995; by EPA Method 8260 between 12/2006 and the present.
5 Analyzed by EPA Method 8260B
6 Analyzed by EPA Method 6000/7000

a Sample was analyzed for Halogenated Volatile Organic Hydrocarbons (HVOCs) by EPA Method 8010. Tetrachloroethene was detected at 6.4 mg/kg. The additional HVOCs were reported as non-detect.
b Chromatograph pattern: Diesel and non-diesel mixture (<C14; >C22).
c Sample was analyzed for HVOCs by EPA Method 8010. All HVOCs were reported as non-detect.
d The Continuing Calibration Verification (CCV) recovery was not within established control limits.
e The PQL was raised due to sample dilution.

a Chromatograph pattern: diesel and non-diesel mixture (<C16; >C22).
b The presence of MTBE was potentially identified at reportable levels.
c The presence of MTBE was identified at a level equal to or above the taste and odor threshold of 40 µg/L.
d The hydrocarbons detected appeared to be gasoline and a non-gasoline mixture.
e Chromatograph pattern: unidentified hydrocarbons C6-C12

TABLE 2
HISTORICAL GROUNDWATER GAUGING AND ANALYTICAL DATA

76 Service Station #6390
402 South Delaware Street
San Mateo, California

Sample ID	As - Built Screen Interval (feet, below TOC)	TOC Elevation (feet)	Date Sampled	Depth to GW (feet)	GWE (feet)	GWE Change (feet)	SPH Thickness (feet)	Sheen	TPHd [1] (µg/L)	TPPH [2] (µg/L)	BTEX [3]				Fuel Oxygenates									Organic [6]
											Benzene (µg/L)	Toluene (µg/L)	Ethylbenzene (µg/L)	Xylenes (µg/L)	1,2-DCA [4] (µg/L)	DIPE [4] (µg/L)	EDB [4] (µg/L)	ETBE [4] (µg/L)	Ethanol [4] (µg/L)	MTBE [5] (µg/L)	TAME [4] (µg/L)	TBA [4] (µg/L)	PCE [4] (µg/L)	Lead (mg/L)

f Chromatograph pattern: weathered gasoline: C6-C12
g Chromatograph pattern: discrete peaks C8-C12
h Chromatograph pattern: discrete peaks
i Sample was additionaly run under EPA Method 8260B. MTBE was detected at 1,140 µg/L. All other analytes were non-detect.
j Single analyte peak(s) were present in the requested fuel quantitation range. Fuel hydrocarbon pattern was not present.
k The concentration reported reflect(s) individual or discrete unidentified peaks not matching a typical fuel pattern.
l Chromatogram not typical of gasoline.
m TPPH was positive due to tetrachloroethane present in the sample.
n PQL was raised due to sample dilution.
o Tetrachloroethene was subtracted from the gasoline range TPH.
p The Continuing Calibration Verification (CCV) recovery was not within established control limits.
q The BC laboratory report indicated that reported concentration of 200 µg/L TPPH was due only to the presence of 90 µg/L PCE, 15 µg/L trichloroethane, and 9.8 µg/L cis-1,2-DCA; therefore, SECOR has represented the results for TPPH in this laboratory report as non-detect.

Analytical data prepared by Sequoia Analytical between 6/15/94 and 2/18/04; by Severn Trent Laboratories between 8/21/03 and 3/01/06; by BC Laboratories between 8/02/06 and the present.

SUBJECT: CONOCOPHILLIPS 76 STATION #6390 AT 402 SOUTH DELAWARE STREET, SAN MATEO, CALIFORNIA

Dear Mr. Kosel:

Thank you for the December 5, 2005, work plan prepared by SECOR International Incorporated. Unfortunately, San Mateo County Groundwater Protection Program (GPP) staff cannot approve the work plan for the following reasons: 1) insufficient detail was provided to evaluate the value of the proposed work; 2) the proposed work appeared insufficient to meet the objective; and 3) some of the specified field protocols violate County requirements without justification. We must say we were disappointed with the work plan considering it was submitted almost eight months after it was due.

The laboratory results from the analysis of soil samples indicates the greatest hydrocarbon impact in soil is generally between 15 and 18 feet below grade (fbg). In addition, the boring logs indicate the site is underlain by an interbedded sequence of low and high permeability soils. Therefore, the laboratory results from SP-1, SP-2, and SP-4 have limited use to assess the lateral and vertical extent of dissolved-phase hydrocarbons because these borings were drilled to only 13 fbg. This situation was discussed at the bottom of Page One of our letter dated January 20, 2005. However, it appears the work plan only proposes to sample "first" groundwater (Bullet #3 on Page Five). The work plan does indicate an additional groundwater sample will be collected from the "desired depth" from a hydropunch drilled in an adjacent boring if a low-permeability layer is encountered, but we cannot establish what this action proposes to investigate. Therefore, we cannot approve the work because we cannot establish if it has a reasonable chance of obtaining the objective (assessment of dissolved-phase plume). Clearly, there is sufficient historical data to propose and justify grab groundwater sampling intervals. Furthermore, we expect the work plan to indicate what sample selection will be based on if field data do not support the historical data. It is imperative soil and groundwater sample selection for laboratory analysis not only be based on PID readings and depth to groundwater, as stated in the work plan, but also stratigraphy, distance from source areas, and the depth of previously identified impacts.

GPP staff concur Monitoring Wells MW-5 and MW-1 through MW-3 should be destroyed because they are screened across low permeability strata. We also concur some replacement wells are necessary. However, the work plan simply proposed to install one replacement well per destroyed well and did not provide any details on the proposed construction of the replacement wells. Again, we would argue there is sufficient historical data to propose and

justify the number of replacement wells and appropriate screened interval(s). Furthermore, we expect the work plan to indicate what the screened interval will be based on if field data does not support the historical data (just saying stratigraphy is not sufficient). ConocoPhillips might be able to justify not installing a replacement well near MW-1 to monitor the sand and gravel between 20 and 25 fbg based on the laboratory results from the historical analysis of groundwater samples from MW-1 when depth to groundwater was >15 fbg (below the uppermost gravel layer). Also, installing the replacement well(s) for MW-3 a little further southwest (e.g. 10 feet) of the existing location may assist in assessment.

The proposed subsurface vapor sampling locations appear reasonable. However, the work plan was extremely inadequate in discussing the proposed vapor sampling work. It is essential all details of the sampling apparatus and sampling methodology be provided and justified (especially given the high failure rates we have seen in performing this task). Furthermore, some of the proposed vapor sampling procedures (e.g. using a Tedlar bag for the vapor sample; raising drill rod before installing and sealing sample tubing; using bentonite to backfill the unsaturated zone portion of vapor borings) violate GPP requirements. Proposed deviations from our requirements must be justified in the work plan. Please note, the groundwater monitoring well portion of the field procedures in Attachment 3 indicates the stability criterion for pH is 0.1%. In addition, the Well Installation and Groundwater Monitoring Well Development portion of the field procedures in Attachment 3 indicates the balance of the borehole above the two-foot-thick bentonite seal placed above the filter pack will consist of bentonite. These procedures would also violate County requirements.

Please upload a revised work plan to the State Geotracker database by **June 26, 2006**. The revised work plan should include the area map prepared by Morrow Surveying in December 2005 (Page Four of the December 2005 work plan).

Please call me at (650) 363-4972 if you have any questions.

Sincerely,

Deno G. Milano, P.G.

SUBJECT: CONOCOPHILLIPS 76 STATION #6390 AT 402 SOUTH DELAWARE STREET, SAN MATEO, CALIFORNIA

Dear Mr. Kosel:

Thank you for the June 22, 2006, work plan prepared by SECOR International Incorporated. The following comments are based on San Mateo County Groundwater Protection Program (GPP) staff review of this work plan and the project file.

The three monitoring wells at the Jiffy Lube site on Figure 2 were installed for the former Shell station at 407 S. Delaware Street. The field point name (FPN) of these wells is S-1, S-2, and S-3 (northwest, northeast, and southeast of the former UST cavity, respectively). These wells were destroyed in September 2001 as a condition of case closure. Please update the electronic file of Figure 2 to show the proper FPN of these wells and to indicate these wells were destroyed.

Page Five of the work plan proposes to collect soil samples from many depths for hydrocarbon analysis. One of the proposed depths is the bottom of the borehole. Please note, the objective of collecting soil samples below the water table is to assess the thickness of the smear zone and give an indication of groundwater contamination if groundwater samples cannot be collected from that depth. Simply deciding to sample soil at the total depth of the boring may or may not provide useful data for hydrocarbon assessment.

GPP staff are concerned that the proposed depth discrete groundwater sampling method may cross-contaminate groundwater samples collected below the water table. Groundwater may enter the boring through the bottom of the drill rod when soil samples are retrieved causing groundwater from different depths to mix and potentially cross-contaminate the hydropunch tool when it is lowered through the drill pipe. In addition, collecting soil and groundwater from the same drilling location makes it impossible to sample groundwater from a particular soil sample depth (i.e. one must assume the lithology surrounding the hydropunch is similar to the lithology of the previously logged soil sample). Nevertheless, to expedite the work, GPP staff will approve the depth discrete groundwater sampling portion of the work plan if the following conditions are implemented:

- Drill two borings at each depth discrete groundwater sampling location (one for soil logging to select appropriate groundwater sampling depths, the other to collect depth

RECEIVED
OCT 20 2006
By

discrete groundwater samples using a Waterloo Profiler or similar tool) unless you can demonstrate the proposed sampling method will obtain representative samples; and

- Delete proposed boring SP-5 unless you can demonstrate adequate smear zone assessment cannot be obtained from the boring proposed for MW-6.

The well destruction and vapor sampling portion of the work plan is approved with the following conditions:

- Destroy MW-5 and MW-1 through MW-3 as proposed in Bullet Three on Page Four of the work plan, not MW-1 and MW-3 through MW-5 as proposed on the top of Page Four of the work plan;

- Ensure the Swagelok® valve at the end of the tubing in the well box is installed in the closed position;

- Use bentonite granules, not powder, and limit bentonite thickness above the sand pack to 0.5 foot;

- Base the adequacy of vapor purging on vacuum drop, not time (submit purge calculations with the drilling permit application);

- Include the volume of air in the filter pack in purge calculations;

- Generate a isopropyl alcohol atmosphere around all connections not tested by the equipment leak (vacuum) test;

- Collect at least one additional subsurface vapor sample beneath the southeast portion of the station building to evaluate if a current vapor inhalation risk may exist to the occupants of the station building; and

- Do not collect vapor samples <5 days after the occurrence of measurable precipitation unless you can demonstrate such data would be representative of subsurface conditions.

GPP staff approve the replacement wells proposed for the onsite wells. However, it appears the construction of the offsite wells should be postponed pending the results of the depth discrete groundwater sampling. In the interim, please consider drilling additional depth discrete groundwater sampling boring pairs near MW-8, SP-4, and MW-5. The need and proposed construction of offsite wells can be recommended in the report on the depth discrete groundwater sampling.

The assessment report must include waste manifest(s), base 10 scaled figures showing all sampling locations to date, and tables summarizing historical gauging data and the laboratory results of all soil, groundwater, and vapor sample analyses performed to date (one table for soil, one for groundwater, and one for vapor). Do not simply include historical tables in an appendix. Each table should indicate the date and depth of sample collection, as appropriate, and the proper FPN. In addition, the site plan in the report should show the limits of excavation stated on Page Two of the work plan.

Table 1 and Paragraph One of Page Two of the work plan cite ethylbenzene, xylenes, nickel, and lead concentrations for Samples A1 through SW3 that differ from the concentrations listed in Tables 5 and 6 of the Kaprealian report dated May 11, 1995. Please verify these concentrations before finalizing the tables in the assessment report. Please upload the report and associated EDFs, GeoWell, GeoBore, GeoMap, and GeoXYZ files to the State Geotracker database by **February 28, 2007**.

Compliance Issues

Review of the State Geotracker database indicates a corrected GeoMap file for denied Confirmation # 6794980704 has not been uploaded as required. Please upload this file by **February 28, 2007**.

A recent public hearing notice mailed to GPP staff by the City of San Mateo indicated the property owner's address was 555 Laurel Avenue, Apartment #425 in San Mateo, California. Our records indicate the property owner lives in Paso Robles, California. Please investigate this discrepancy and notify GPP staff of the property owner's current address. I can be reached at (650) 363-4972 if you have any questions.

Sincerely,

Deno G. Milano, P.G.

Revised March 2006

SUBSURFACE DRILLING APPLICATION

REQUIREMENTS:

An accurate & correct map of existing and proposed well/boring locations must be included with the permit application. The well/boring location map must include the following.

1. North arrow, existing & historic site features, wells, approximate property lines and any other pertinent existing & historic features and information.
2. Proposed well/boring locations to scale. As-built locations/dimensions must be finalized in subsequent report of findings.

A workplan is required by County Staff. Upon review of information on this application and the submitted workplan, and subject to approval noted below, a permit will be issued allowing well/boring owner, driller, and responsible professional (consultant) to perform the specified work. The permit is subject to both General and Special Conditions stated below. A copy of the approved Subsurface Drilling Permit must be available on site while work related to the permit is being performed. Drilling date and time must be scheduled with County staff at least three (3) working days in advance of field work.

GENERAL CONDITIONS:

A. Well and boring construction and destruction under this permit is subject to the Standards for the Construction of Wells in San Mateo County, County Groundwater Protection Program (GPP) Guidelines, Policies & Procedures, the State Water Well Standards, and any instructions by a Health Department representative.

B. Well/Boring Owner, Driller, and Responsible Professional assume responsibility for all activities and uses under the permit, including compliance with Workmen's Compensation Laws, and indemnify, defend and save the County of San Mateo, its' officers, agents and employees, free and harmless from any and all expense, cost, or liability in connection with or resulting from work or stopped-work associated with the permit, including, but not limited to, property damage, personal injury, wrongful death, and loss of income.

C. All borings must be properly destroyed (grouted/sealed) within 24 hours of drilling unless special conditions are approved in writing as part of this permit.

D. Analytical results of all soil and groundwater samples collected during the execution of drilling under this permit must be submitted to County GPP staff by the Responsible Professional within 60 days of sample collection. If contamination is discovered during drilling, verbal notification to County GPP by the Responsible Professional is required within 72 hours of discovery. Proper storage, labeling & disposal of investigation-derived wastes are the responsibility of the consultant unless stated otherwise contractually.

E. In addition to the County copy of the State DWR Form 188, boring logs and well construction details for all borings/wells, signed by a Responsible Professional, must be submitted to County GPP within 60 days of drilling/construction/destruction.

F. Permit is valid only for the purpose specified herein. No change in construction procedure, as described on this permit application, in the associated workplan, or in the special conditions below, will be allowed except upon written permission from the County.

G. Permit may be voided if field check reveals any misrepresentation of proposed well/boring locations on this permit application, the attached location map, or the submitted workplan.

H. Permit is valid for one mobilization only and is automatically canceled if not exercised, or if an extension is not requested by Responsible Professional and granted by County GPP, within 90 days of permit issuance date. Failure to notify staff of cancellation or delay in start time, in a timely manner, may result in additional hourly charges to be invoiced to the consultant by GPP Staff.

I. Wells installed under this permit may not be used for domestic, municipal, commercial, or irrigation water supply.

J. All workplans and reports related to work performed under County oversight must conform to County GPP guidelines, Regional Water Quality Control Board guidelines, and State Water Well Standards.

K. Top-of-casing elevation of all wells must be surveyed to the nearest 0.01-foot relative to Mean Sea Level (NAVD88) and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate.

L. Latitude and longitude of all wells must be surveyed with sub-meter accuracy relative to NAD83 and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate.

M. Violation of any requirement or general or special permit condition may result in an order by GPP staff to cease work under this permit, correct the violation, and potentially re-permit the work as a new mobilization.

Revised March 2006

SUBSURFACE DRILLING APPLICATION

REQUIREMENTS:

An accurate & correct map of existing and proposed well/boring locations must be included with the permit application. The well/boring location map must include the following.

1. North arrow, existing & historic site features, wells, approximate property lines and any other pertinent existing & historic features and information.
2. Proposed well/boring locations to scale. As-built locations/dimensions must be finalized in subsequent report of findings.

A workplan is required by County Staff. Upon review of information on this application and the submitted workplan, and subject to approval noted below, a permit will be issued allowing well/boring owner, driller, and responsible professional (consultant) to perform the specified work. The permit is subject to both General and Special Conditions stated below. A copy of the approved Subsurface Drilling Permit must be available on site while work related to the permit is being performed. Drilling date and time must be scheduled with County staff at least three (3) working days in advance of field work.

GENERAL CONDITIONS:

A. Well and boring construction and destruction under this permit is subject to the Standards for the Construction of Wells in San Mateo County, County Groundwater Protection Program (GPP) Guidelines, Policies & Procedures, the State Water Well Standards, and any instructions by a Health Department representative.

B. Well/Boring Owner, Driller, and Responsible Professional assume responsibility for all activities and uses under the permit, including compliance with Workmen's Compensation Laws, and indemnify, defend and save the County of San Mateo, its' officers, agents and employees, free and harmless from any and all expense, cost, or liability in connection with or resulting from work or stopped-work associated with the permit, including, but not limited to, property damage, personal injury, wrongful death, and loss of income.

C. All borings must be properly destroyed (grouted/sealed) within 24 hours of drilling unless special conditions are approved in writing as part of this permit.

D. Analytical results of all soil and groundwater samples collected during the execution of drilling under this permit must be submitted to County GPP staff by the Responsible Professional within 60 days of sample collection. If contamination is discovered during drilling, verbal notification to County GPP by the Responsible Professional is required within 72 hours of discovery. Proper storage, labeling & disposal of investigation-derived wastes are the responsibility of the consultant unless stated otherwise contractually.

E. In addition to the County copy of the State DWR Form 188, boring logs and well construction details for all borings/wells, signed by a Responsible Professional, must be submitted to County GPP within 60 days of drilling/construction/destruction.

F. Permit is valid only for the purpose specified herein. No change in construction procedure, as described on this permit application, in the associated workplan, or in the special conditions below, will be allowed except upon written permission from the County.

G. Permit may be voided if field check reveals any misrepresentation of proposed well/boring locations on this permit application, the attached location map, or the submitted workplan.

H. Permit is valid for one mobilization only and is automatically canceled if not exercised, or if an extension is not requested by Responsible Professional and granted by County GPP, within 90 days of permit issuance date. Failure to notify staff of cancellation or delay in start time, in a timely manner, may result in additional hourly charges to be invoiced to the consultant by GPP Staff.

I. Wells installed under this permit may not be used for domestic, municipal, commercial, or irrigation water supply.

J. All workplans and reports related to work performed under County oversight must conform to County GPP guidelines, Regional Water Quality Control Board guidelines, and State Water Well Standards.

K. Top-of-casing elevation of all wells must be surveyed to the nearest 0.01-foot relative to Mean Sea Level (NAVD88) and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate.

L. Latitude and longitude of all wells must be surveyed with sub-meter accuracy relative to NAD83 and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate.

M. Violation of any requirement or general or special permit condition may result in an order by GPP staff to cease work under this permit, correct the violation, and potentially re-permit the work as a new mobilization.

San Mateo, California
77CP.1574.05.1222
February 28, 2007

APPENDIX B
FIELD AND LABORATORY PROCEDURES

Hydraulic Push (GEOPROBE) Drilling

Utility Locating

Prior to drilling, boring locations are marked with white paint or other discernible marking and cleared for underground utilities through Underground Service Alert (USA). In addition, the first five feet of each borehole are air-knifed, or carefully advanced with a hand auger if shallow soil samples are necessary, to help evaluate the borehole location for underground structures or utilities.

Borehole Advancement

Single-Wall GEOPROBE:
Pre-cleaned push rods (typically one to two inches in diameter) are advanced using a hydraulic push type rig for the purpose of collecting samples and evaluating subsurface conditions. The drill rod serves as a soil sampler, and an acetate liner is inserted into the annulus of the drill rod prior to advancement. Once the sample is collected, the rods and sampler are retracted and the sample tubes are removed from the sampler head. The sampler head is then cleaned, filled with clean sample tubes, inserted into the borehole and advanced to the next sampling point where the sample collection process is repeated.

Dual-Wall GEOPROBE:
Pre-cleaned push rods are advanced using a hydraulic push type rig for the purpose of collecting samples and evaluating subsurface conditions. Larger diameter push rod(s) (typically 4 inches outer diameter) are advanced to the desired depth to seal the upper water-bearing zone. Outer rods are not extended into the saturated zone before collection of groundwater samples. Smaller diameter push rod(s) (typically 2 inches in outer diameter, but larger enough to almost completely fill the annulus of the outer push rod(s)) are advanced within the annulus of the outer push rod to the total depth. The lead inner rod serves as a soil sampler, and an acetate liner is inserted into the annulus of the lead inner rod prior to advancement. Once the soil sample is collected, the inner rod(s) and sampler are retracted and the sample tubes are removed from the sampler head. The sampler head is cleaned, filled with clean sample tubes, and the process of advancing the outer rods prior to the advancement of the sampler rods repeated until the total depth of sampling is reached.

Soil Sample Collection

The undisturbed soil samples intended for laboratory analysis are cut away from the acetate sample liner using a hacksaw, or equivalent tool, in sections approximately 6 inches is length. Hand augered portions of the boring are sampled using a slide hammer to drive brass liners into the soil. The 6 inch samples are lined at each end with Teflon® sheets and capped with plastic caps. Labels documenting job number, borehole identification, collection date, and depth are affixed to each sample. The samples are then placed into an ice-filled cooler for delivery under chain-of-custody to a laboratory certified by the State of California to perform the specified tests. The remaining collected soil that has not been selected for laboratory analysis is logged using the United Soil Classification System (USCS) under the

direction of a State Registered Professional Geologist, and is field screened for organic vapors using a photo ionization detector (PID), or an equivalent tool. Soil cuttings generated are stored in Department of Transportation (DOT) approved 55-gallon steel drums, or an equivalent storage container.

Grab Groundwater Sample Collection

Once the desired groundwater sampling depth has been reached, a Hydropunch tip is affixed to the head of the sampling rods. The Hydropunch tip is advanced between approximately 6 inches to one foot within the desired groundwater sampling zone (effort is made to emplace the Hydropunch screen across the center of the water table), and retracted to expose the Hydropunch screen. Grab groundwater samples are collected by lowering a pre-cleaned, single-sample polypropylene, disposable bailer down the annulus of the sampler rod. The groundwater sample is discharged from the bailer to the sample container through a bottom emptying flow control valve to minimize volatilization. Alternatively, groundwater samples are collected by lowering a disposable bailer through the sampler rod or into the borehole.

Collected water samples are discharged directly into laboratory provided, pre-cleaned, vials or containers and sealed with Teflon-lined septum, screw-on lids. Labels documenting sample number, well identification, collection date, and type of preservative (if applicable, i.e. HCl for TPPH, BTEX, and fuel oxygenates) are affixed to each sample. The samples are then placed into an ice-filled cooler for delivery under chain-of-custody to a laboratory certified by the State of California to perform the specified tests.

Borehole Completion

Upon completion of drilling and sampling, the rods are retracted. Neat cement grout, mixed at a ratio of 6 gallons of water per 94 pounds of Portland cement, is introduced, via a tremmie pipe, and pumped to displace standing water in the borehole. Displaced groundwater is collected at the surface into DOT approved 55-gallon steel drums, or an equivalent storage container. In areas where the borehole penetrates asphalt or concrete, the borehole is capped with an equivalent thickness of asphalt or concrete patch to match finished grade.

Hollow Stem Auger Drilling/Monitoring Well Installation

Utility Locating

Prior to drilling, boring locations are marked with white paint or other discernible marking, and cleared for underground utilities through Underground Service Alert (USA). In addition, the first five feet of each borehole are air-knifed, or carefully advanced with a hand auger if shallow soil samples are necessary, to help evaluate the presence of underground structures or utilities.

Borehole Advancement

Pre-cleaned hollow stem augers (typically 8 to 10 inches in diameter) are advanced using a drill rig for the purpose of collecting samples and evaluating subsurface conditions. Upon completion of drilling and sampling, if no well is to be constructed, the augers are retracted, and the borehole is filled with neat cement grout, mixed at a ratio of 6 gallons of water per

94 pounds of Portland cement, through a tremmie pipe, and pumped to displace standing water in the borehole. In areas where the borehole penetrates asphalt or concrete, the borehole is capped with an equivalent thickness of asphalt or concrete patch to match finish grade.

During the drilling process, a physical description of the encountered soil characteristics (i.e. moisture content, consistency or density, odor, color, and plasticity), drilling difficulty, and soil type as a function of depth are described on boring logs. The soil cuttings are classified in accordance with the USCS.

Soil cuttings are temporarily stored on-site in 55-gallon DOT approved drums pending laboratory analysis, waste profiling and proper disposal. A label is affixed to the drums indicating the contents of the drum, suspected contaminants, date of drilling, borehole number, and depth interval from which the contents were generated.

Split-Spoon Sampling

The precleaned split spoon sampler lined with three 6-inch long brass or stainless steel tubes is driven 18 inches into the underlying soils at the desired sample depth interval. The sampler is driven by repeatedly dropping a 140-pound hammer a free fall distance of 30 inches. The number of blows (blow count) to advance the sampler for each six-inch drive length is recorded on the field logs. Once the sampler is driven the 18-inch drive length or the sampler has met refusal (typically 50 blows per six inches), the sampler is retrieved. Alternatively, with a limited access rig, soil samples are obtained by driving the sample using a pneumatic hammer.

Of the three sample tubes, the bottom sample is generally selected for laboratory analysis. The sample is carefully packaged for chemical analysis by capping each end of the sample with a Teflon sheet followed by a tight-fitting plastic cap, and sealing the cap with non-VOC, self-adhering silicon tape. A label is affixed to the sample indicating the sample identification number, borehole number, sampling depth, sample collection date, and job number. The sample is then annotated on a chain-of-custody form and placed in an ice-filled cooler for transport to the laboratory.

The remaining soil samples are used for soil classification and field evaluation of headspace volatile organic vapors, where applicable, using a photo ionization or flame ionization detector calibrated to a calibration gas (typically isobutylene or hexane). VOC vapor concentrations are recorded on the boring logs.

Groundwater Monitoring Well Installation and Development

Groundwater monitoring wells are constructed by inserting or tremmieing well materials through the annulus of the hollow stem auger. The groundwater monitoring wells are constructed with a screen interval determined from the encountered soil stratigraphy, to maintain a proper seal at the surface (minimum three feet), and to avoid penetrating aquitards. Groundwater wells are installed in accordance with the conditions of the well construction permit issued by the regulatory agency exercising jurisdiction over the project site.

The well screen generally consists of schedule 40 polyvinyl chloride (PVC) casing with 0.01 to 0.02 factory slots. As a general rule, 0.01 inch slots are used in fine-grained silts and

clays and 0.02 inch slots are used in coarse-grained materials. The screen is then filter packed with #2/12 or #3 sand, or equivalent, for the 0.01 and 0.02 inch slots, respectively.

Once the borehole has been drilled to the desired depth, bentonite chips (to backfill an aquitard) or six inches of filter sand are tremmied to the bottom of the boring. The well screen and blank well casing are then inserted through the annulus of the hollow stem augers. The well screen is sand packed by tremmieing the appropriate filter sand through the annulus between the casing and augers while slowly retracting the augers. During this operation, the depth of the sand pack in the auger is continuously sounded so that the sand remains in the auger annulus during auger retraction to avoid short-circuiting the well. The sand pack is tremmied to approximately two feet above the screen, at which time pre-development surging is performed to consolidate the sand pack. Additional sand is added as necessary to help ensure that the sand pack extends a minimum of two feet above top of screen. Following construction of the sand pack, a two foot thick bentonite seal is tremmied over the sand and hydrated in place. The remainder of the borehole is backfilled with Portland neat cement grout (or the equivalent), mixed at ratio of 6 gallons of water per 94 pounds of neat cement. The well head is then capped with a locking cap and secured with a lock to protect the well from surface water intrusion and vandalism.

The well head is further protected from damage with traffic a rated well box in paved areas or locking steel riser in undeveloped areas. The protective boxes or risers are set in concrete. The details of well construction are recorded on well construction logs.

Following well construction, the wells are developed in accordance with agency protocols by intermittently surging and bailing the wells. Development is deemed to be sufficient once pH, conductivity and temperature stabilize to within approximately ≤ 0.1, ≤ 3%, and ≤ 10%, respectively, or when ten casing volumes have been removed.

Semi-Annual Groundwater Sampling

Depth to Groundwater/SPH Thickness Measurements

Prior to the beginning of purging and sampling the wells, the depth to groundwater and thickness of SPH, if present, within each well casing are measured to the nearest 0.01 foot using either an electronic water level indicator or an electronic oil-water interface probe. This is done in within as narrow a time frame as possible, and before the first well is purged. Measurements are taken from a point of known elevation on the top of each well casing as determined in accordance with surveys by licensed land surveyors.

Groundwater Monitoring Well Purging

Groundwater wells are purged using low-flow protocol at a flow rate of less than 1 liter per minute using a bladder pump. The purge intake is placed opposite the portion of the saturated zone expected to contain the greatest hydrocarbon impact, and the depth of the purge intake is recorded during and after purging. The water level in each well is monitored, and care is taken that the well is not dewatered. The conductivity, temperature, and pH of the delivered effluent are monitored and recorded using a flow-through cell during purge operations. Purge operations are determined to be sufficient once three successive measurements of pH, conductivity, and temperature of the purged water at 3 to 5 minute intervals following the evacuation of one system or line volume vary by ≤ 0.1, ≤ 3%, and ≤ 10%, respectively. System

or line volumes, actual purge volumes, and the purging equipment used are recorded on the field data sheets.

Groundwater Sample Acquisition, Handling, and Analysis

Following purging operations, groundwater samples are collected from each of the wells, using a low-flow bladder pump. The groundwater sample is discharged from the pump tubing to the sample container before the water passes through the flow-through cell. The sampling equipment is recorded on the field data sheets.

Collected water samples are discharged directly into laboratory provided, pre-cleaned, and chemically preserved sample containers for the analyses requested. Preservatives are used in the samples if appropriate for the analyses, i.e. hydrochloric acid (HCl) for TPPH, BTEX, and fuel oxygenates by EPA Method 8260B.

Labels documenting sample number, well identification, collection date and time, type of sample and type of preservative (if applicable) are affixed to each sample. The samples are then placed into an ice-filled cooler for delivery under chain of custody to a certified laboratory. The type of preservative used is documented on the chain of custody form.

To help assure the quality of the collected samples and to evaluate the potential for cross contamination during transport to the laboratory, a distilled-water trip blank accompanies the samples in the cooler. The trip blank is analyzed for the presence of volatile organic compounds of concern. For petroleum hydrocarbons, the trip blank is typically analyzed for TPHg, BTEX, and fuel oxygenates by EPA Method 8260.

Subslab Soil Vapor Probe Installation

Utility Locating

Prior to drilling, boring locations are marked with white paint or other discernible marking, and cleared for underground utilities through Underground Service Alert (USA). In addition, a private sub-surface utility locator is contracted, to help evaluate the presence of underground structures or utilities.

Borehole Advancement

A pilot hole, approximately 1/16-inch larger in diameter than the diameter of the soil vapor probe (though smaller in diameter than the head of the soil vapor probe), is advanced no further than 3 inches into the native material beneath the concrete building slab, using a rotary hammer drill or equivalent equipment. A shallow outer hole is advanced on top of the pilot hole. The diameter of the outer hole is large enough to accommodate the head of the soil vapor probe and the tools necessary to attach the sampling tubing to the probe, and is deep enough to allow the probe to be set flush with the slab surface. Slab cuttings are removed using a small portable vacuum.

Probe Installation

The soil vapor probe is constructed of small diameter (1/8-inch to ¼-inch outside diameter) chromatography grade 316 stainless steel tubing, stainless steel compression to thread fittings, and a Swagelok-type valve at the top of the probe. The tubing at the bottom of the

probe is cut to allow the probe to "float" in the slab, and avoid obstruction of the subslab material by the probe. The probe is set in the inner hole to be flush with the ground surface. A quick drying concrete slurry, which expands upon drying, is applied within the annulus between the soil vapor probe and the outer hole to seal the probe in place. The seal is allowed to cure for at least 24 hours prior to sampling.

Installing Soil Vapor Probes and Soil Vapor Sampling

Utility Locating

Prior to drilling and sampling, the presence of utilities in the area of the proposed soil vapor point(s) is evaluated by marking the location of the boring(s) in white paint or other method, and clearing the area through Underground Service Alert (USA). At each sampling location, a two to four-inch core is made in the surface pavement to allow access of the boring equipment.

Borehole Advancement and Probe Installation

The borehole is advanced to the desired sampling depth using a 6-inch diameter hand auger. The soil vapor probe is attached a length of Tygon® tubing that is at least two feet greater than the total depth of the borehole with a closed Swagelok® type valve attached to the opposite end. The vapor probe is set at a depth approximately 6 inches above the total depth of the borehole in a #3 Monterey Sand (or the equivalent) filter pack that is at a minimum of one foot thick. A half-foot thick layer of granulated bentonite is placed above the filter pack and hydrated. The soil vapor point is completed to the surface with neat cement grout mixed at a ratio of 6 gallons of water per 94 pounds of cement. A traffic rated is will be set in concrete, flush with the ground surface. The excess length of Tygon® tubing with the Swagelok® type valve is coiled up inside the well box.

Vapor Sampling

Soil vapor sampling is performed after a minimum time duration of 1 week, to allow the neat cement grout to cure, and to allow the subsurface vapor concentrations disturbed during installation activities to equilibrate. The sampling apparatus consists of two six-liter Summa canisters (one for vapor sample collection and one for system purging) connected via a manifold to a vacuum gauge, a ½-hour (100 to 200 ml/minute) flow regulator, and a filter. The sampling apparatus is assembled and a leak check performed prior to mobilization to the field. The leak checked is performed by closing the system at the down-hole side of the filter and opening the valve on the purge Summa canister. If the negative vacuum pressure of 30 inches of mercury (inHg) is maintained over a fifteen minute period, the apparatus passes the leak check. Once the sampling apparatus is assembled in the field, Tygon® tubing is attached to the down-hole side of the filter and connected to the Swagelok® type valve on the soil vapor sampling point. The apparatus is leak checked again. Once the apparatus passes the field leak check, the system is purged of three system volumes. The system volume is determined by adding together the volume of the airspace within the Tygon® tubing, the volume of the vapor well annulus airspace, and the volume of the airspace within the manifold, being careful to account for the volume of the vapor point within the filter pack material. This system volume is used to calculate the vacuum pressure drop that will occur during the purging of three system volumes, and can be divided by the flow rate of 200 ml/minute to derive the purge time.

The following equations are used to calculate the purge rate:

$$V_s = \left[\pi \left(\frac{D_i}{2} \right)^2 L \right] x + V_a + V_m$$

V_s = System Volume
D_i = Tubing Inner Diameter (in inches)
L = Tubing Length (in inches)
x = Conversion Constant (16.39 mL/in^3)
V_a = Annulus Volume
V_m = Manifold Volume

$$V_a = \left[\pi \left(\frac{Da}{2} \right)^2 h \, x \, \varphi \right] + 0.7(V_p)$$

V_a = Annulus Airspace Volume
D_a = Annulus Diameter
h = Annulus Height
x = Conversion Constant (16.39 mL/in^3)
φ = Porosity
V_p = Vapor Point Volume

$$t_p = \frac{V_s}{F}$$

t_p = Purge Time
V_s = System Volume
F = Flow Rate

$$\frac{V_i}{P_i} = \frac{V_s}{P_p}$$

V_i = Summa Canister Volume
P_i = Initial Summa Pressure
V_s = System Volume
P_p = Purge Pressure Drop

After the system purge, the soil vapor is collected by closing the valve on the purge Summa canister and opening the valve on the sampling Summa canister. The sampling start time is recorded on the field data sheet. Isopropyl alcohol (IPA), or the equivalent, is used as a leak check compound. A piece of gauze is attached to the down-hole side of the Swagelok® type valve and moistened with IPA, taking care not to apply the IPA directly to the tubing, valves, and fittings. The gauze is re-moistened with IPA every five minutes. After approximately one half hour, or when the vacuum pressure of the system reaches 5 inHg, the sampling canister valve is closed and the end time is recorded. Prior to sampling subsequent sample locations, the used tubing is discarded.

The sampling canister(s) and chain of custody is labeled with the site name, sampling ID, time and date of sampling, final vacuum pressure, and the canister serial number. The sampling canister(s) are shipped to a California certified laboratory for analysis.

Organic Vapor Procedures

Soil samples are collected for analysis in the field for ionizable organic compounds using a PID with a 10.2 eV lamp. The test procedure involves measuring approximately 30 grams from an undisturbed soil sample, placing this sub-sample in a Ziploc™-type bag or in a clean glass jar, and sealing the jar with aluminum foil secured under a ring-type threaded lid. The container is warmed for approximately 20 minutes (in the sun); then the head-space within the container is tested for total organic vapor, measured in parts per million as benzene (ppm; volume/volume). The instrument is calibrated prior to drilling. The results of the field-testing are noted on the boring logs. PID readings are useful for indicating relative levels of contamination, but cannot be used to evaluate petroleum hydrocarbon levels with the confidence of laboratory analyses.

Equipment Decontamination

Equipment that could potentially contact subsurface media and compromise the integrity of the samples is carefully decontaminated prior to drilling and sampling. Drill augers and other large pieces of equipment are decontaminated using high pressure hot water spray. Samplers, groundwater pumps, liners and other equipment are decontaminated in an

Alconox scrub solution and double rinsed in clean tap water rinse followed by a final distilled water rinse.

The rinsate and other wastewater are contained in 55-gallon DOT-approved drums, labeled (to identify the contents, generation date and project) and stored on-site pending waste profiling and disposal.

Soil Cuttings and Rinsate/Purge Water

Soil cuttings and rinsate/purge water generated during drilling and sampling are stored on-site in DOT-approved 55-gallon steel drums pending characterization. A label is affixed to the drums indicating the contents of the drum, suspected contaminants, date of generation, and the boring number from which the waste is generated. The drums are removed from the site by a licensed waste disposal contractor to an appropriate facility for treatment/recycling.

WELL DEVELOPMENT LOG

Project Number 72GP.01524.05.1204 Well MW-9

Project Name offsite Assessment Development Subcontractor Cascade Drilling

Performed/Supervised Jaime Ricci

Development Method Airlift Sub. Pump Surge Block (Bailer) Other _____

Development Criteria Surge Prior to Purging 10 casing Volumes

Equipment Cleaning Method Liquinox

Field Instruments Used Multimeter & Turbidity Meter

Development Water Disposal Method 55-gallon drum.

Comments _____

DEVELOPMENT DATA

Depth to Water: Start 14.47 End 14.47 Ref. Point Elev. _____ Height Above Ground Surface _____

FIELD OFFICE:

TO:

ATTN:

6:30 - 9:00 AM Drive Time to site

9:00 AM - Health & Safety Tailgate. Regulator, Dena Milano, onsite. He expressed concerns regarding precipitation in the past 5 days. Call to Adrian Perez in office to obtain precipitation records. For South SF Precipitation was: .14" 1/16/07, .02" 1/18/07 website reference is www.wunderground.com

Less than .25" for 5 day period. Based on fine grained lithology, surface cover of asphalt/concrete, vadose zone is not likely saturated.

10:00 AM - Initial pressure on VP-1 through VP-3 & PURGE-1 through PURGE-3 at -30.5 mmHg.

10:10 AM - 15 min. pressure check on VP/PURGE set up

10:15 AM - VP3/PURGE3 Failed vacuum check after 2 mins. Used 4th manifold

10:40 AM - All three (VP1/P1, VP2/P2, VP3/P3) systems passed vapor vacuum test.

10:55 AM - VP3/P3 : Initial Vac. -26 mmHg → Final Vac <-1 mmHg

11:02 AM - VP2/P2 : Initial Vac. -31 mmHg → Final Vac -4.5 mmHg

11:08 AM - VP1/P1 : Initial Vac. -30.5 mmHg → Final Vac -4.5 mmHg

11:29 AM - VP3 Sampling initiated -27 , 12:00 end -2

11:39 AM - VP1 Sampling initiated -30.5 , 12:10 end -4

11:41 AM - VP2 Sampling initiated -31.0 , 12:16 end -4.5

1245 - Sampling Complete. offsite

SUB SLAB	2033632.5	6034448.9	37.5658663	-122.3191413			

BASIS OF COORDINATES AND ELEVATIONS:

COORDINATES ARE CALIFORNIA STATE PLANE ZONE 3 COORDINATES FROM GPS OBSERVATIONS USING UNIVERSITY OF CALIFORNIA BAY AREA DEFORMATION CORS STATION OBSERVATION FILES AND BASED ON THE CALIFORNIA SPATIAL REFERENCE CENTER DATUM, REFERENCE EPOCH 2000.35.
COORDINATE DATUM IS NAD 83(1986).
DATUM ELLIPSOID IS GRS80.
REFERENCE GEOID IS NGS99.
CORS STATIONS USED WERE FARB AND DIAB.
VERTICAL DATUM IS NAVD 88 FROM GPS OBSERVATIONS.

February 28, 2007

Is Data Valid? (circle)
YES
NO

Preservation Temperature (If Known)
5.7 °C

Secor Lab Validation Sheet

Project/Client: ConocoPhillips/ 76 Service Station #6390
Project #: 7G8-01574.0 5.1222
Date of Validation: 2/13/07 **Date of Analysis:** 12/19 - 12/21/06 **Sample Date:** 12/15/06
Completed By: Jaime Ricci **Signature:** Jaime Ricci
Analytical Lab Used and Report # (if any): BC 06.13250

		Circle/Highlight Yes or No
1.	Was the analysis the one requested?	Yes No
2.	Do the sample number(s) on the chain-of-custody (COC) match the one(s) that appear on the laboratory data sheet?	Yes No
3.	Were samples prepared (extracted, filtered, etc.) within EPA holding times?	Yes No
4.	Once prepared/extracted, were the samples analyzed within the EPA holding times?	Yes No
5.	Were Laboratory blanks performed, if so, were they below non-detect?	Yes No
6.	Are the units correct? (i.e., soil samples in mg/kg or ug/g, water samples mg/L, ug/L, and air samples in volume mg/m^3,etc.)	Yes No
7.	Were appropriate Matrix Spike (MS) and Matrix Spike Duplicate (MSD) samples included in the laboratory batch sample?	Yes No
8.	In lieu of MS/ MSD, were surrogate spike (SS) or surrogate spike duplicate (SSD) samples included in the laboratory batch samples?	Yes No
9.	Were MS/ MSD (or SS/SSD) within the acceptable range of % recovery (i.e., approx 80-120% depending on analyte)?	Yes No
10.	Were MS/MSD (or SS/SSD) values used to calculate Relative Percent Difference (RPD)?	Yes No
11.	Were Relative Percent Difference values within the acceptable range (i.e. ± 25%)?	Yes No

If any answer is no, explain why and what corrective action was taken:

One sample had a chromatogram not typical of gasoline
The continuing calibration verification recovery was not within established control limits for the majority of soil samples for TBA, and one sample for ethanol.

Notes And Definitions

MDL	Method Detection Limit
ND	Analyte Not Detected at or above the reporting limit
PQL	Practical Quantitation Limit
RPD	Relative Percent Difference
A01	PQL's and MDL's are raised due to sample dilution.
A53	Chromatogram not typical of gasoline.
V11	The Continuing Calibration Verification (CCV) recovery is not within established control limits.
Z1	TPPH is due to chlorinated hydrocarbons only, PCE, TCE and Cis-1,2-DCE. There is no "gasoline" present.

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.
All results listed in this report are for the exclusive use of the submitting party. BC Laboratories, Inc. assumes no responsibility for report alteration, separation,, detachment or third party interpretation.

Is Data Valid? (circle)
YES
NO

Preservation Temperature (If Known)
5.4 °C

Secor Lab Validation Sheet

Project/Client: ConocoPhillips / 76 Service Station #6390
Project #: 77LB.01574.05.1222
Date of Validation: 2/13/07 **Date of Analysis:** 1/10-1/13/07 **Sample Date:** 1/2-1/4/07
Completed By: Jaime Ricci **Signature:** Jaime Ricci
Analytical Lab Used and Report # (if any): BC 0400272

		Circle/Highlight Yes or No
1.	Was the analysis the one requested?	Yes No
2.	Do the sample number(s) on the chain-of-custody (COC) match the one(s) that appear on the laboratory data sheet?	Yes No
3.	Were samples prepared (extracted, filtered, etc.) within EPA holding times?	Yes No
4.	Once prepared/extracted, were the samples analyzed within the EPA holding times?	Yes No
5.	Were Laboratory blanks performed, if so, were they below non-detect?	Yes No
6.	Are the units correct? (i.e., soil samples in mg/kg or ug/g, water samples mg/L, ug/L, and air samples in volume mg/m^3,etc.)	Yes No
7.	Were appropriate Matrix Spike (MS) and Matrix Spike Duplicate (MSD) samples included in the laboratory batch sample?	Yes No
8.	In lieu of MS/ MSD, were surrogate spike (SS) or surrogate spike duplicate (SSD) samples included in the laboratory batch samples?	Yes No
9.	Were MS/ MSD (or SS/SSD) within the acceptable range of % recovery (i.e., approx 80-120% depending on analyte)?	Yes No
10.	Were MS/MSD (or SS/SSD) values used to calculate Relative Percent Difference (RPD)?	Yes No
11.	Were Relative Percent Difference values within the acceptable range (i.e. ± 25%)?	Yes No

If any answer is no, explain why and what corrective action was taken:

Two samples had surrogates below the LCL due to matrix interference verified by second extraction/analysis

Notes And Definitions

MDL	Method Detection Limit
ND	Analyte Not Detected at or above the reporting limit
PQL	Practical Quantitation Limit
RPD	Relative Percent Difference
A01	PQL's and MDL's are raised due to sample dilution.
A20	Surrogate is low due to matrix interference. Interference verified through second extraction/analysis.
S09	The surrogate recovery on the sample for this compound was not within the control limits.

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

All results listed in this report are for the exclusive use of the submitting party. BC Laboratories, Inc. assumes no responsibility for report alteration, separation,, detachment or third party interpretation.

NO

Preservation Temperature (If Known)
4.4 °C

Secor Lab Validation Sheet

Project/Client: ConocoPhillips/ 76 Service Station #6390
Project #: 7716.0154.05.1222
Date of Validation: 2/13/07 **Date of Analysis:** 1/31/07 - 2/1/07 **Sample Date:** 1/26/07
Completed By: Jaime Ricci **Signature:** Jaime Ricci
Analytical Lab Used and Report # (if any): BC 0701089

		Circle/Highlight Yes or No
1.	Was the analysis the one requested?	Yes No
2.	Do the sample number(s) on the chain-of-custody (COC) match the one(s) that appear on the laboratory data sheet?	Yes No
3.	Were samples prepared (extracted, filtered, etc.) within EPA holding times?	Yes No
4.	Once prepared/extracted, were the samples analyzed within the EPA holding times?	Yes No
5.	Were Laboratory blanks performed, if so, were they below non-detect?	Yes No
6.	Are the units correct? (i.e., soil samples in mg/kg or ug/g, water samples mg/L, ug/L, and air samples in volume mg/m^3,etc.)	Yes No
7.	Were appropriate Matrix Spike (MS) and Matrix Spike Duplicate (MSD) samples included in the laboratory batch sample?	Yes No
8.	In lieu of MS/ MSD, were surrogate spike (SS) or surrogate spike duplicate (SSD) samples included in the laboratory batch samples?	Yes No
9.	Were MS/ MSD (or SS/SSD) within the acceptable range of % recovery (i.e., approx 80-120% depending on analyte)?	Yes No
10.	Were MS/MSD (or SS/SSD) values used to calculate Relative Percent Difference (RPD)?	Yes No
11.	Were Relative Percent Difference values within the acceptable range (i.e. ± 25%)?	Yes No

If any answer is no, explain why and what corrective action was taken:

One sample had a surrogate below the LCL and a surrogate above the UCL.

LABORATORY NARRATIVE
Modified TO-14A
Secor
Workorder# 0701341A

Three 6 Liter Summa Canister samples were received on January 23, 2007. The laboratory performed analysis via modified EPA Method TO-14A using GC/MS in the full scan mode. The method involves concentrating up to 0.2 liters of air. The concentrated aliquot is then flash vaporized and swept through a water management system to remove water vapor. Following dehumidification, the sample passes directly into the GC/MS for analysis.

Method modifications taken to run these samples are summarized in the below table. Specific project requirements may over-ride the ATL modifications.

Requirement	***TO-14A***	***ATL Modifications***
Daily CCV	+- 30% Difference	</= 30% Difference with two allowed out up to </=40%.; flag and narrate outliers
Initial Calibration criteria	RSD<30%	RSD</=30%, two compounds allowed up to 40%
BFB absolute abundance criteria	Within 10% of that from previous day	CCV internal standard area counts are compared to ICAL, corrective action for > 40% D
Blank acceptance criteria	<0.20 ppbv	<Reporting Limit
Moisture control	Nafion Dryer	Multisorbent trap
Sample collection media	Summa canister	ATL recommends use of summa canisters to insure data defensibility, but will report results from Tedlar bags at client request

Receiving Notes

The Chain of Custody was not relinquished properly. The discrepancy was noted in the Sample Receipt Confirmation email/fax.

Analytical Notes

The reported CCV for each daily batch may be derived from more than one analytical file due to the client's request for non-standard compounds.

Non-standard compounds may have different acceptance criteria than the standard TO-14A/TO-15 compound list as per contract or verbal agreement.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction no

performed).

J - Estimated value.
E - Exceeds instrument calibration range.
S - Saturated peak.
Q - Exceeds quality control limits.
U - Compound analyzed for but not detected above the reporting limit.
UJ- Non-detected compound associated with low bias in the CCV
N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified
b-File was quantified by a second column and detector
r1-File was requantified for the purpose of reissue

LABORATORY NARRATIVE
Modified TO-3
Secor
Workorder# 0701341B

Three 6 Liter Summa Canister samples were received on January 23, 2007. The laboratory performed analysis for volatile organic compounds in air via modified EPA Method TO-3 using gas chromatography with flame ionization detection. The method involves concentrating up to 200 mL of sample. The concentrated aliquot is then dry purged to remove water vapor prior to entering the chromatographic system. The TPH (Gasoline Range) results are calculated using the response factor of Gasoline and correspond to the range of hydrocarbons from C5 to C10. A molecular weight of 100 is used to convert the TPH (Gasoline Range) ppmv result to ug/L.

See the data sheets for the reporting limits for each compound.

Method modifications taken to run these samples include:

Requirement	***TO-3***	***ATL Modifications***
Daily Calibration Standard Frequency	Prior to sample analysis and every 4 - 6 hrs	Prior to sample analysis and after the analytical batch </= 20 samples
Initial Calibration Calculation	4-point calibration using a linear regression model	5-point calibration using average Response Factor
Initial Calibration Frequency	Weekly	When daily calibration standard recovery is outside 75 - 125 %, or upon significant changes to procedure or instrumentation
Moisture Control	Nafion system	Sorbent system
Minimum Detection Limit (MDL)	Calculated using the equation DL = A+3.3S, where A is intercept of calibration line and S is the standard deviation of at least 3 reps of low level standard	40 CFR Pt. 136 App. B
Preparation of Standards	Levels achieved through dilution of gas mixture	Levels achieved through loading various volumes of the gas mixture

Receiving Notes

The Chain of Custody was not relinquished properly. The discrepancy was noted in the Sample Receipt Confirmation email/fax.

Analytical Notes

There were no analytical discrepancies.

Definition of Data Qualifying Flags

Seven qualifiers may have been used on the data analysis sheets and indicate as follows:
B - Compound present in laboratory blank greater than reporting limit.
J - Estimated value.
E - Exceeds instrument calibration range.
S - Saturated peak.
Q - Exceeds quality control limits.
U - Compound analyzed for but not detected above the detection limit.
M - Reported value may be biased due to apparent matrix interferences.

File extensions may have been used on the data analysis sheets and indicates as follows:
a-File was requantified
b-File was quantified by a second column and detector
r1-File was requantified for the purpose of reissue

LABORATORY NARRATIVE
Modified ASTM D-1946
Secor
Workorder# 0701341C

Three 6 Liter Summa Canister samples were received on January 23, 2007. The laboratory performed analysis via Modified ASTM Method D-1946 for Methane and fixed gases in air using GC/FID or GC/TCD. The method involves direct injection of 1.0 mL of sample.

On the analytical column employed for this analysis, Oxygen coelutes with Argon. The corresponding peak is quantitated as Oxygen.

Method modifications taken to run these samples include:

Requirement	***ASTM D-1946***	***ATL Modifications***
Calibration	A single point calibration is performed using a reference standard closely matching the composition of the unknown.	A 3-point calibration curve is performed. Quantitation is based on a daily calibration standard which may or may not resemble the composition of the associated samples.
Reference Standard	The composition of any reference standard must be known to within 0.01 mol % for any component.	The standards used by ATL are blended to a >/= 95% accuracy.
Sample Injection Volume	Components whose concentrations are in excess of 5 % should not be analyzed by using sample volumes greater than 0.5 mL.	The sample container is connected directly to a fixed volume sample loop of 1.0 mL on the GC. Linear range is defined by the calibration curve. Bags are loaded by vacuum.
Normalization	Normalize the mole percent values by multiplying each value by 100 and dividing by the sum of the original values. The sum of the original values should not differ from 100% by more than 1.0%.	Results are not normalized. The sum of the reported values can differ from 100% by as much as 15%, either due to analytical variability or an unusual sample matrix.
Precision	Precision requirements established at each concentration level.	Duplicates should agree within 25% RPD for detections > 5 X's the RL.

Receiving Notes

The Chain of Custody was not relinquished properly. The discrepancy was noted in the Sample Receipt Confirmation email/fax.

Analytical Notes

There were no analytical discrepancies.

Definition of Data Qualifying Flags

Seven qualifiers may have been used on the data analysis sheets and indicate as follows:
B - Compound present in laboratory blank greater than reporting limit.
J - Estimated value.
E - Exceeds instrument calibration range.
S - Saturated peak.
Q - Exceeds quality control limits.
U - Compound analyzed for but not detected above the detection limit.
M - Reported value may be biased due to apparent matrix interferences.
File extensions may have been used on the data analysis sheets and indicates as follows:
a-File was requantified
b-File was quantified by a second column and detector
r1-File was requantified for the purpose of reissue

LABORATORY NARRATIVE
Modified TO-14A
Secor
Workorder# 0702149A

Three 6 Liter Summa Canister samples were received on February 08, 2007. The laboratory performed analysis via modified EPA Method TO-14A using GC/MS in the full scan mode. The method involves concentrating up to 0.2 liters of air. The concentrated aliquot is then flash vaporized and swept through a water management system to remove water vapor. Following dehumidification, the sample passes directly into the GC/MS for analysis.

Method modifications taken to run these samples are summarized in the below table. Specific project requirements may over-ride the ATL modifications.

Requirement	***TO-14A***	***ATL Modifications***
Daily CCV	+- 30% Difference	</= 30% Difference with two allowed out up to </=40%.; flag and narrate outliers
Initial Calibration criteria	RSD<30%	RSD</=30%, two compounds allowed up to 40%
BFB absolute abundance criteria	Within 10% of that from previous day	CCV internal standard area counts are compared to ICAL, corrective action for > 40% D
Blank acceptance criteria	<0.20 ppbv	<Reporting Limit
Moisture control	Nafion Dryer	Multisorbent trap
Sample collection media	Summa canister	ATL recommends use of summa canisters to insure data defensibility, but will report results from Tedlar bags at client request

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

The reported CCV for each daily batch may be derived from more than one analytical file due to the client's request for non-standard compounds.

Non-standard compounds may have different acceptance criteria than the standard TO-14A/TO-15 compound list as per contract or verbal agreement.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit.
UJ- Non-detected compound associated with low bias in the CCV
N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:
a-File was requantified
b-File was quantified by a second column and detector
r1-File was requantified for the purpose of reissue

LABORATORY NARRATIVE
Modified TO-3
Secor
Workorder# 0702149B

Three 6 Liter Summa Canister samples were received on February 08, 2007. The laboratory performed analysis for volatile organic compounds in air via modified EPA Method TO-3 using gas chromatography with flame ionization detection. The method involves concentrating up to 200 mL of sample. The concentrated aliquot is then dry purged to remove water vapor prior to entering the chromatographic system. The TPH (Gasoline Range) results are calculated using the response factor of Gasoline and correspond to the range of hydrocarbons from C5 to C10. A molecular weight of 100 is used to convert the TPH (Gasoline Range) ppmv result to ug/L. See the data sheets for the reporting limits for each compound.

Method modifications taken to run these samples include:

Requirement	***TO-3***	***ATL Modifications***
Daily Calibration Standard Frequency	Prior to sample analysis and every 4 - 6 hrs	Prior to sample analysis and after the analytical batch </= 20 samples
Initial Calibration Calculation	4-point calibration using a linear regression model	5-point calibration using average Response Factor
Initial Calibration Frequency	Weekly	When daily calibration standard recovery is outside 75 - 125 %, or upon significant changes to procedure or instrumentation
Moisture Control	Nafion system	Sorbent system
Minimum Detection Limit (MDL)	Calculated using the equation DL = A+3.3S, where A is intercept of calibration line and S is the standard deviation of at least 3 reps of low level standard	40 CFR Pt. 136 App. B
Preparation of Standards	Levels achieved through dilution of gas mixture	Levels achieved through loading various volumes of the gas mixture

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

There were no analytical discrepancies.

Definition of Data Qualifying Flags

Seven qualifiers may have been used on the data analysis sheets and indicate as follows:
B - Compound present in laboratory blank greater than reporting limit.

J - Estimated value.
E - Exceeds instrument calibration range.
S - Saturated peak.
Q - Exceeds quality control limits.
U - Compound analyzed for but not detected above the detection limit.
M - Reported value may be biased due to apparent matrix interferences.

File extensions may have been used on the data analysis sheets and indicates as follows:
a-File was requantified
b-File was quantified by a second column and detector
r1-File was requantified for the purpose of reissue

LABORATORY NARRATIVE
Modified ASTM D-1946
Secor
Workorder# 0702149C

Three 6 Liter Summa Canister samples were received on February 08, 2007. The laboratory performed analysis via Modified ASTM Method D-1946 for Methane in air using GC/FID. The method involves direct injection of 1.0 mL of sample.

Method modifications taken to run these samples include:

Requirement	***ASTM D-1946***	***ATL Modifications***
Calibration	A single point calibration is performed using a reference standard closely matching the composition of the unknown.	A 3-point calibration curve is performed. Quantitation is based on a daily calibration standard which may or may not resemble the composition of the associated samples.
Reference Standard	The composition of any reference standard must be known to within 0.01 mol % for any component.	The standards used by ATL are blended to a >/= 95% accuracy.
Sample Injection Volume	Components whose concentrations are in excess of 5 % should not be analyzed by using sample volumes greater than 0.5 mL.	The sample container is connected directly to a fixed volume sample loop of 1.0 mL on the GC. Linear range is defined by the calibration curve. Bags are loaded by vacuum.
Normalization	Normalize the mole percent values by multiplying each value by 100 and dividing by the sum of the original values. The sum of the original values should not differ from 100% by more than 1.0%.	Results are not normalized. The sum of the reported values can differ from 100% by as much as 15%, either due to analytical variability or an unusual sample matrix.
Precision	Precision requirements established at each concentration level.	Duplicates should agree within 25% RPD for detections > 5 X's the RL.

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

There were no analytical discrepancies.

LABORATORY NARRATIVE
Modified TO-14A
Secor
Workorder# 0702150A

One 6 Liter Summa Canister sample was received on February 08, 2007. The laboratory performed analysis via modified EPA Method TO-14A using GC/MS in the full scan mode. The method involves concentrating up to 0.2 liters of air. The concentrated aliquot is then flash vaporized and swept through a water management system to remove water vapor. Following dehumidification, the sample passes directly into the GC/MS for analysis.

Method modifications taken to run these samples are summarized in the below table. Specific project requirements may over-ride the ATL modifications.

Requirement	***TO-14A***	***ATL Modifications***
Daily CCV	+- 30% Difference	</= 30% Difference with two allowed out up to </=40%.; flag and narrate outliers
Initial Calibration criteria	RSD<30%	RSD</=30%, two compounds allowed up to 40%
BFB absolute abundance criteria	Within 10% of that from previous day	CCV internal standard area counts are compared to ICAL, corrective action for > 40% D
Blank acceptance criteria	<0.20 ppbv	<Reporting Limit
Moisture control	Nafion Dryer	Multisorbent trap
Sample collection media	Summa canister	ATL recommends use of summa canisters to insure data defensibility, but will report results from Tedlar bags at client request

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

The reported CCV for each daily batch may be derived from more than one analytical file due to the client's request for non-standard compounds.

Non-standard compounds may have different acceptance criteria than the standard TO-14A/TO-15 compound list as per contract or verbal agreement.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit.

UJ- Non-detected compound associated with low bias in the CCV
N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:
a-File was requantified
b-File was quantified by a second column and detector
r1-File was requantified for the purpose of reissue

LABORATORY NARRATIVE
Modified TO-3
Secor
Workorder# 0702150BR1

One 6 Liter Summa Canister sample was received on February 08, 2007. The laboratory performed analysis for volatile organic compounds in air via modified EPA Method TO-3 using gas chromatography with flame ionization detection. The method involves concentrating up to 200 mL of sample. The concentrated aliquot is then dry purged to remove water vapor prior to entering the chromatographic system. The TPH (Gasoline Range) results are calculated using the response factor of Gasoline and correspond to the range of hydrocarbons from C5 to C10. A molecular weight of 100 is used to convert the TPH (Gasoline Range) ppmv result to ug/L.

See the data sheets for the reporting limits for each compound.

Method modifications taken to run these samples include:

Requirement	***TO-3***	***ATL Modifications***
Daily Calibration Standard Frequency	Prior to sample analysis and every 4 - 6 hrs	Prior to sample analysis and after the analytical batch </= 20 samples
Initial Calibration Calculation	4-point calibration using a linear regression model	5-point calibration using average Response Factor
Initial Calibration Frequency	Weekly	When daily calibration standard recovery is outside 75 - 125 %, or upon significant changes to procedure or instrumentation
Moisture Control	Nafion system	Sorbent system
Minimum Detection Limit (MDL)	Calculated using the equation DL = A+3.3S, where A is intercept of calibration line and S is the standard deviation of at least 3 reps of low level standard	40 CFR Pt. 136 App. B
Preparation of Standards	Levels achieved through dilution of gas mixture	Levels achieved through loading various volumes of the gas mixture

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

There were no analytical discrepancies.

THE WORK ORDER WAS REISSUED ON FEBRUARY 23, 2007 TO CORRECT IDENTIFICATION OF THE SAMPLE SUBSLAB PER CLIENT'S REQUEST.

Definition of Data Qualifying Flags

Seven qualifiers may have been used on the data analysis sheets and indicate as follows:
B - Compound present in laboratory blank greater than reporting limit.
J - Estimated value.
E - Exceeds instrument calibration range.
S - Saturated peak.
Q - Exceeds quality control limits.
U - Compound analyzed for but not detected above the detection limit.
M - Reported value may be biased due to apparent matrix interferences.

File extensions may have been used on the data analysis sheets and indicates as follows:
a-File was requantified
b-File was quantified by a second column and detector
r1-File was requantified for the purpose of reissue

LABORATORY NARRATIVE
Modified ASTM D-1946
Secor
Workorder# 0702150C

One 6 Liter Summa Canister sample was received on February 08, 2007. The laboratory performed analysis via Modified ASTM Method D-1946 for Methane and fixed gases in air using GC/FID or GC/TCD. The method involves direct injection of 1.0 mL of sample.

On the analytical column employed for this analysis, Oxygen coelutes with Argon. The corresponding peak is quantitated as Oxygen.

Method modifications taken to run these samples include:

Requirement	***ASTM D-1946***	***ATL Modifications***
Calibration	A single point calibration is performed using a reference standard closely matching the composition of the unknown.	A 3-point calibration curve is performed. Quantitation is based on a daily calibration standard which may or may not resemble the composition of the associated samples.
Reference Standard	The composition of any reference standard must be known to within 0.01 mol % for any component.	The standards used by ATL are blended to a >/= 95% accuracy.
Sample Injection Volume	Components whose concentrations are in excess of 5 % should not be analyzed by using sample volumes greater than 0.5 mL.	The sample container is connected directly to a fixed volume sample loop of 1.0 mL on the GC. Linear range is defined by the calibration curve. Bags are loaded by vacuum.
Normalization	Normalize the mole percent values by multiplying each value by 100 and dividing by the sum of the original values. The sum of the original values should not differ from 100% by more than 1.0%.	Results are not normalized. The sum of the reported values can differ from 100% by as much as 15%, either due to analytical variability or an unusual sample matrix.
Precision	Precision requirements established at each concentration level.	Duplicates should agree within 25% RPD for detections > 5 X's the RL.

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

There were no analytical discrepancies.

1.0 Introduction

This report has been prepared by Stantec Consulting Corporation (Stantec) on behalf of the ConocoPhillips Company (ConocoPhillips), to further investigate subsurface conditions beneath 76 Service Station No. 6390, located at 402 South Delaware Street, San Mateo, California (the "site", Figure 1). The work was done in accordance with Stantec's *Additional Assessment and Sensitive Receptor Survey Work Plan*, dated July 9, 2007 and Stantec's *Revisions to Additional Assessment and Sensitive Receptor Survey Work Plan*, dated March 25, 2008. The work plans were approved with modifications in letters from the San Mateo County Health Department – Groundwater Protection Program (SMCHD-GPP) dated January 30, 2008 and July 28, 2008 (Appendix A). Verbal approval was provided by the SMCHD-GPP on July 11, 2008 to move forward with the work proposed in the revised work plan.

2.0 Site Background

2.1 SITE LOCATION

The 76 branded Service Station property (the "site") is located at 402 South Delaware Street, on the south corner of South Delaware Street and East Fourth Avenue in the City of San Mateo, San Mateo County, California (Figure 1). The site is bordered by South Delaware Street to the northeast, East Fourth Avenue to the northwest, and commercial buildings to the southwest and southeast. There are two active gasoline service stations located in the near vicinity: a Shell station on the north corner of East Third Avenue and South Delaware Street, and an ARCO station on the south corner of East Third Avenue and South Delaware Street. Historically, there used to be a Shell service station directly across South Delaware Street from the site on the east corner of South Delaware Street and East Fourth Avenue; a Jiffy Lube now exists at this location. Additionally, a former 76 branded service station was located on the west corner of East Third Avenue and El Dorado Street.

The site is an active service station dispensing 76 branded gasoline. The station facilities include two unleaded gasoline underground storage tanks (USTs) located in a common pit in the southeast portion of the property, three product dispenser islands, and a station building (Figure 2). The USTs were installed at the site in August 1992 during station upgrade activities. A 550-gallon waste oil UST formerly located behind the station building was removed from the site when the current gasoline USTs were installed.

2.2 SITE HISTORY

In August 1992, Kaprealian Engineering, Inc. (KEI) observed the removal of two 12,000-gallon capacity, fiberglass, gasoline underground storage tanks (USTs), one 550-gallon waste oil UST, and the associated product piping and dispensers. A 9-inch long crack was observed along the eastern end of the super unleaded gasoline UST upon removal. Subsequent petroleum hydrocarbon contamination was observed at the eastern end of the gasoline UST cavity. The cavity was over-excavated to remove as much of the impacted soil as possible, resulting in a final excavation that measured approximately 30 feet long by 27 feet wide by 22 feet deep. Initially, six soil samples were collected (A1, A2, B1, B2, SW1, and SW2) from the bottom and sidewalls of the UST cavity, one soil sample (WO1) was collected from the bottom of the waste oil UST cavity, and six soil samples (P1, P2, P3, P4, P5, and P6) were collected from the bottom of the product piping trenches. KEI returned at a later date to collect an additional three samples (SW1(2.5), SW2(2.5), and SW3) from the gasoline UST cavity and a grab water sample (W1). The water sample was collected after a total of approximately 5,800 gallons of water had been pumped form the gasoline UST cavity. The groundwater was observed to have floating product and a heavy sheen. Additionally, KEI collected three soil samples (D1, D2 , and D3) from beneath the gasoline dispensers. Laboratory analysis of soil samples collected from the gasoline UST cavity indicated the presence of up to 5,000 milligrams per kilogram (mg/kg) total petroleum hydrocarbons as gasoline (TPHg, B2), 47 mg/kg benzene (B2), 470 mg/kg

toluene (B2), 120 mg/kg ethylbenzene (B2), 790 mg/kg total xylenes (B2), and 5.9 mg/kg total petroleum hydrocarbons as diesel (TPHd, SW3). The requested petroleum hydrocarbon constituents were not reported above laboratory detection limits in the soil samples collected from the product piping trenches and from beneath the gasoline dispensers. Laboratory analysis of the soil sample from the waste oil UST indicated the presence of the heavy metals cadmium, chromium, nickel, lead and zinc at concentrations of 1.1 mg/kg, 67 mg/kg, 73 mg/kg, 6.0 mg/kg, and 44 mg/kg, respectively, while the remaining petroleum hydrocarbon constituents were not indicated at concentrations above the laboratory detection limits. Analysis of the water sample collected from the gasoline UST indicated 28,000 micrograms per liter (µg/L) TPHd, 50,000 µg/L TPHg, 1,200 µg/L benzene, 6,700 µg/L toluene, 1,400 µg/L ethylbenzene, and 10,000 µg/L total xylenes. Laboratory results are included in Table 1 (KEI, 1992).

In May 1994, KEI installed three monitoring wells (MW1, MW2, and MW3, later known as MW-1, MW-2 and MW-3) at the site (Figure 2). Laboratory analysis of the soil samples collected from the borings for monitoring wells MW-2 and MW-3 indicated the presence of TPHg and benzene, toluene, ethylbenzene, and total xylenes (BTEX) at maximum concentrations of 2,600 mg/kg TPHg (MW2 (17)), 26 mg/kg benzene (MW2 (15)), 240 mg/kg toluene (MW2 (15)), 62 mg/kg ethylbenzene (MW2 (17)), and 410 mg/kg total xylenes (MW2 (17)). The requested petroleum hydrocarbon constituents were not reported above laboratory detection limits in the soil samples collected form the MW-1 borehole. The wells were initially monitored and sampled in June 1994. Laboratory analysis of the water samples collected indicated the presence of petroleum hydrocarbons in MW-2 and MW-3, with maximum concentrations of 89,000 µg/L TPHg, 11,000 µg/L benzene, 37,000 µg/L toluene, 3,000 µg/L ethylbenzene, and 20,000 µg/L total xylenes reported in MW-2. The depth to water ranged from 15.33 to 16.71 feet below ground surface (bgs), with the evaluated groundwater gradient being approximately 0.004 foot/foot to the east. KEI concluded to follow a three month monitoring program, at which point the wells would be re-sampled. Laboratory results are included in Tables 1 and 2 (KEI, 1994).

In March 1995, two additional monitoring wells (MW4 and MW5, later known as MW-4 and MW-5) were installed in offsite locations in the sidewalk along the opposite side of South Delaware Street form the site (Figure 2). The offsite wells were located in the down-gradient direction from the site. Laboratory analysis of the soil samples collected from the monitoring well boreholes indicated the presence of TPHg and BTEX at maximum concentrations of 600 mg/kg TPHg, 3.3 mg/kg benzene, 38 mg/kg toluene, 14 mg/kg ethylbenzene, and 96 mg/kg total xylenes in soil sample MW4 (5). The new wells were added to the quarterly groundwater monitoring and sampling program, and were first sampled in April 1995. Laboratory analysis of the water samples collected from MW-4 and MW-5 indicated the presence of maximum concentrations of 150,000 µg/L TPHg, 12,000 µg/L benzene, 40,000 µg/L toluene, 4,700 µg/L ethylbenzene, and 31,000 µg/L total xylenes reported in MW-4. Laboratory results are included in Tables 1 and 2 (KEI, 1995).

In January 1996, GeoStrategies (GSI) observed the excavation and removal of a 150 gallon capacity oil/water separator. A confirmation soil sample (OWS-S-4.5) was collected from underneath the oil/water separator at a depth of 4.5 feet bgs. Laboratory analysis of the sample

indicated the presence of trace concentrations of TPHd, toluene, and total xylenes at 1.5 mg/kg, 0.006 mg/kg, and 0.009 mg/kg, respectively. Additionally, the presence of the heavy metals chromium, nickel, lead, and zinc were indicated at concentrations of 160 mg/kg, 99 mg/kg, 13 mg/kg, and 69 mg/kg, respectively. The remaining requested petroleum hydrocarbon constituents were not reported above laboratory detection limits. Laboratory results are included in Table 1 (GSI, 1996).

In February 1996, KEI supervised the advancement of three Geoprobe® soil borings (SP1, SP2, and SP4) at offsite locations (Figure 2). The soil borings were terminated at a depth of 13 feet bgs, with groundwater encountered at approximately 10.5 feet bgs. Grab water samples were collected from each borehole. Laboratory analysis of the water samples indicated the presence of TPHg, benzene, ethylbenzene, and total xylenes in the sample from boring SP-4 at concentrations of 450 µg/L, 71 µg/L, 6.7 µg/L, and 17 µg/L, respectively. The requested petroleum hydrocarbon constituents were not reported above laboratory detection limits in the groundwater samples from borings SP-1 and SP-2. A summary of laboratory results is included in Table 2 (KEI, 1996).

In June 1996, Pacific Environmental Group, Inc. (Pacific) performed a well survey and reviewed California Department of Water Resources (DWR) well records. Four documented wells were identified within a ¼-mile radius of the site (Pacific, 1996).

In December 2006 and January 2007, SECOR supervised the advancement of four direct push soil borings (SP-5 through SP-8), the installation of three soil vapor wells (VP-1 through VP-3) and four groundwater monitoring wells (MW-6 through MW-9), and the destruction of four groundwater monitoring wells (MW-1, MW-2, MW-3, and MW-5) (Figure 2). Laboratory analysis of the soil samples collected indicated the presence of up to 1,300 mg/kg total purgeable petroleum hydrocarbons (TPPH, MW-6@16.5-17), 0.18 mg/kg benzene (MW-6@11-11.5), 32 mg/kg toluene (MW-6@11-11.5), 20 mg/kg ethylbenzene (MW-6@11-11.5), 110 mg/kg total xylenes (MW-6@11-11.5), and 0.089 mg/kg methyl tertiary butyl ether (MTBE, MW-6@19.5-20). Grab sample analytical results indicated the presence of up to 51,000 µg/L TPPH (SP-8), 1,300 µg/L benzene (SP-5), 1,500 µg/L toluene (SP-5), 3,000 µg/L ethylbenzene (SP-8), 9,600 µg/L total xylenes (SP-8), and 330 µg/L MTBE (SP-5). Groundwater samples from the wells contained petroleum hydrocarbons in MW-6 (67,000 µg/L TPPH, 380 µg/L benzene, 8,600 µg/L toluene, 3,600 µg/L ethylbenzene, 17,000 µg/L total xylenes, and 62 µg/L MTBE), and MW-9 (0.73 µg/L xylenes). Laboratory analysis of the soil vapor samples indicated the presence of up to 0.75 micrograms per liter (µg/L) TPPH (VP-3), up to 16 µg/L toluene (VP-1), 14 µg/L ethylbenzene (VP-3), 42 µg/L m,p-xylenes (VP-3), and 29 µg/L o-xylenes (VP-3). The laboratory analysis additionally indicated that the samples were composed of 20-22% O_2 and 0.46-1.0% CO_2. SECOR concluded that hydrocarbons in soil had been adequately delineated, the lateral extent of hydrocarbons in groundwater had been delineated up-gradient and cross-gradient, the lateral extent of hydrocarbons in deeper groundwater had been delineated to the southwest (cross-gradient) by SP-7, and that vapor inhalation did not appear to be an exposure pathway at the site. SECOR recommended a down-gradient well in the shallow water bearing zone, down-gradient wells in deeper groundwater along East Fifth Avenue and Delaware Street,

wells in deeper groundwater northwest and northeast (up and cross-gradient) of the site, analysis for PCE, and historical research to investigate a source for the PCE (SECOR, 2007).

The site has been monitored and sampled since the second quarter 1994. From 1994 to 2000, the site was monitored on a quarterly basis. Since 2001, the frequency has been reduced to semi-annual monitoring and sampling. Historically, the highest dissolved phase petroleum hydrocarbon concentrations have occurred in wells MW-2 and MW-3, and most recently in well MW-6. The groundwater gradient has been mainly to the east and southeast, and was to the northeast during the last event (SECOR, 2008). Laboratory results are included in Table 2.

Historical soil and groundwater sampling locations are shown on Figure 2, and historical soil, groundwater, gradient, and soil vapor data are summarized in Tables 1 through 4.

3.0 Scope of Work

On July 31, 2008 through August 11, 2008, Stantec field staff observed WDC Drilling (WDC) of Martinez, California, install two shallow monitoring wells (MW-10 and MW-11) and four deep groundwater monitoring wells (MW-12B, MW-13B, MW-14B, and MW-15B). On August 14 and 15, 2008, Stantec observed WDC develop the groundwater monitoring wells. On August 18, 2008 Stantec purged and sampled wells MW-12B, MW-13B, MW-14B, and MW-15B. Wells MW-10 and MW-11 were observed as dry and not sampled. On August 18, 2008, Stantec witnessed the surveying of MW-10, MW-11, MW-12B, MW-13B, MW-14B, and MW-15B and measured groundwater elevations in the site wells. The completed scope of work is discussed below. Additionally, Stantec performed a sensitive receptor survey to help evaluate the site for low-risk closure.

3.1 SITE HEALTH AND SAFETY PLAN

As required by the Occupational Health and Safety Administration Standard "Hazardous Waste Operations and Emergency Response" guidelines (29 CFR 1910.120), and by the California Occupational Health and Safety Administration "Hazardous Waste Operations and Emergency Response" guidelines (CCR Title 8, Section 5192), Stantec updated the current site-specific Health and Safety Plan (HASP) prior to the commencement of fieldwork. The HASP was reviewed by field staff and contractors before beginning field operations, and was in the possession of Stantec personnel while conducting work activities at the site.

3.2 PERMITTING

Prior to installing the groundwater monitoring wells, Stantec obtained a rider to an open encroachment permit from the City of San Mateo Department of Public Works for the advancement of five offsite monitoring wells (MW-10, MW-11, MW-12B, MW-14B, and MW-15B). The rider to the encroachment permit was approved on July 23, 2008. Stantec also obtained two exploratory boring permits from the SMCHD-GPP for the advancement of one onsite groundwater monitoring well and five offsite groundwater monitoring wells on City property, which were approved on July 23, 2008. Copies of the permits are included in Appendix A.

3.3 SUBSURFACE UTILITY CLEARANCE AND CONDUIT STUDY

Prior to initiating field activities on July 24, 2008, Stantec marked the boring locations (MW-10, MW-11, MW-12B, MW-13B, MW-14B, and MW-15B), contacted Underground Service Alert (USA) 48 hours prior to the initiation of field work, and contracted Cruz Brothers Locators (CBL), a private utility locator, to evaluate whether the proposed boring locations were clear of potential subsurface obstructions.

Monitoring wells MW-11, MW-12B, MW-13B, and MW-15B were cleared to depths of 5 feet bgs using an air lance and vacuum truck prior to commencement of mechanical drilling. On August 1, 2008, while clearing MW-10, a potential storm drain was encountered in South Delaware Street. The City of San Mateo was contacted and verified that there was a storm drain in that vicinity. Permission was granted by the City to move MW-10 and MW-14B into the sidewalk. CBL cleared the new locations and did not identify potential subsurface utilities beneath the proposed locations of the wells. Monitoring wells MW-10 and MW-14B were cleared to depths of 6.5 and 8 feet bgs, respectively, using a hand auger and an air lance and vacuum, prior to commencement of mechanical drilling.

3.4 GROUNDWATER MONITORING WELL INSTALLATION

On July 31 through August 11, 2008, two shallow groundwater monitoring wells (MW-10 and MW-11) and four deep groundwater monitoring wells (MW-12B, MW-13B, MW-14B, and MW-15B) were installed using a limited access HSA rig equipped with 8 inch to 18 inch diameter auger flights. Monitoring wells MW-10 and MW-14B were installed offsite in the sidewalk along South Delaware Street northeast and east of the site. Monitoring wells MW-11 and MW-15B were installed offsite in the parking lane along South Delaware Street southeast of the site. MW-12B was installed in the parking lane along East Fifth Avenue east of the site, and MW-13B was installed onsite near MW-6.

3.4.1 Shallow Groundwater Monitoring Wells

The shallow groundwater monitoring well borings MW-10 and MW-11 were advanced to depths of 17.5 and 15 feet bgs, respectively. Groundwater was not encountered in the borings for the shallow wells during drilling.

The shallow monitoring wells were constructed using 2-inch diameter poly vinyl chloride (PVC) casing with a 0.020-inch slotted screen interval extending from 6 to 13.5 feet bgs in MW-10 and 5 to 15 feet bgs in MW-11. A filter pack of #3 Monterey sand was placed in the annulus across from the screen to 0.5 -1.0 feet above the screen. A 1.5-2.0 foot thick bentonite seal (hydrated chips) was placed above the sand pack. Neat cement grout (mixed at a ratio of 6 gallons of water per 94 pounds of Portland cement) was tremmied from the top of the bentonite seal to 1 foot bgs. The well materials were tremmied through the annulus of the HSA flights. The wells were completed at the surface with traffic rated well boxes set in concrete dyed to match the existing grade, and a locking well cap was placed on the casing. Because a potential aquitard was encountered at the bottom of the borehole for monitoring well MW-10, a bentonite seal was emplaced within this fine-grained material at the bottom of the borehole prior to well construction. This potential aquitard was not penetrated through during the drilling operations.

3.4.2 Deep Groundwater Monitoring Wells

The deep groundwater monitoring well borings MW-12B, MW-13B, MW-14B and MW-15B were advance to depths of 30, 31, 29, and 29 feet bgs, respectively. Groundwater was encountered between16.25 feet and 18.79 feet bgs surface in the deep wells.

The deep monitoring wells were constructed using 2-inch diameter poly vinyl chloride (PVC) casing with a 0.020-inch slotted screen interval extending from 19 to 29 feet bgs in MW-12B, 21 to 31 feet bgs in MW-13B, 18.75 to 28.75 feet bgs in MW-14B, and 17 to 27 feet bgs in MW-15B. A filter pack of #3 Monterey sand was placed in the annulus across from the screen to 0.1 -1.0 feet above the screen. A 2.0-2.4 foot thick bentonite seal (hydrated chips) was placed above the sand pack. Neat cement grout (mixed at a ratio of 6 gallons of water per 94 pounds of Portland cement) was tremmied from the top of the bentonite seal to 1 foot bgs. The well materials were tremmied through the annulus of the HSA flights. The wells were completed at the surface with a traffic rated well box set in concrete dyed to match the existing grade, and a locking well cap was placed on the casing. Because a potential aquitard was encountered at the bottom of the borehole for monitoring well MW-15B, a bentonite seal was emplaced within this fine-grained material at the bottom of the borehole prior to well construction. This potential aquitard was not penetrated through during the drilling operations.

Because free groundwater was encountered in the shallow zone at the locations of MW-12B and MW-13B, conductor casing was emplaced in the shallow zone of these borings prior to advancement to the deeper zone. The 10-inch diameter steel conductor casing was installed in the boring approximately 1.5 inches (MW-12B) and 1 foot (MW-13B) into the underlying aquitard and grouted in place and allowed to cure for 72 hours prior to advancement through the casing. Free groundwater was not encountered within the shallow zone of MW-14B and MW-15B, therefore, the use of conductor casing was not necessary.

Stantec's field procedures are included in Appendix B. The boring logs illustrating well construction details are included in Appendix C.

3.5 SOIL SAMPLE COLLECTION AND ANALYSIS

The soil borings were continuously sampled and described in accordance with the Unified Soil Classification System (USCS) by a Stantec scientist under the direction of a California Professional Geologist. Soil samples were contained in brass liners that were inserted into the sampler. Soil samples were examined for odors, visible signs of petroleum hydrocarbons, and screened for hydrocarbon vapors using a photo-ionization detector (PID). Unsaturated and saturated soil samples showing positive readings on a photo-ionization detector (PID) and collected from within encountered zones of low permeability (potential aquitards) were analyzed. Selected soil samples were placed on ice and submitted to a California certified laboratory to be analyzed for the presence of total purgeable petroleum hydrocarbons (TPPH); benzene, toluene, ethylbenzene and total xylenes (BTEX); 1,2-dichloroethane (1,2-DCA), di-isopropyl ether (DIPE), ethylene dibromide (EDB), ethyl tertiary butyl ether (ETBE), ethanol, MTBE, tertiary amyl methyl ether (TAME), and tertiary butyl alcohol (TBA) by Environmental Protection Agency (EPA) Method 8260.

Stantec's standard field procedures are included in Appendix B.

3.6 MONITORING WELL DEVELOPMENT, SAMPLING, AND ANALYSIS

On August 14 and 15, 2008, Stantec personnel developed the newly installed monitoring wells MW-12B through MW-15B. Approximately 10.1-10.6 casing volumes were purged from the wells. The last three successive measurements of temperature, conductivity, and pH of the purged groundwater varied by ≤10%, ≤6%, and ≤0.1, respectively. On August 14, 2008, Stantec personnel noted that pH parameters were very low and recalibrated the meter. A new meter was available and used for the second day of well development. Development was deemed to be sufficient once 10 casing volumes were removed. Groundwater monitoring wells MW-10 and MW-11 were reported as dry and not developed.

On August 18, 2008, Stantec personnel purged and sampled groundwater monitoring wells MW-12B through MW-15B using low-flow protocol at a flow rate of less than 1 liter per minute using a bladder pump. The pump intake was placed at a depth in the water column that was opposite the portion of the saturated zone expected to contain the greatest hydrocarbon impact. Criteria for this selection included the depth of the highest soil impact encountered during well installation, the as-built screen interval, and the recorded depth to water. For wells MW-12B, MW-13B, and MW-14B, because the screens were submerged and there was no known soil impact, the pump intake was placed at the top of the screen interval. Because the well MW-15B was observed to have an exposed screen, and no hydrocarbon compounds were known to be present in soil within the screened interval, the proposed intake depth was the center of the observed water column. The conductivity, temperature, and pH of the delivered effluent were monitored every three minutes using a flow-through cell during purging and recorded on the field data sheets. Purging ended once three successive measurements of pH, conductivity, and temperature of the purged water stabilized to within 0.1, 3%, and 10%, respectively. The samples were analyzed for TPPH, BTEX, MTBE, ethanol, TBA, TAME, DIPE, ETBE, EDB, and 1,2-DCA by EPA Method 8260B, and PCE (tetrachloroethene), TCE (trichloroethene) and 1,2-DCE (1,2-dichloroethene) by EPA 8260B. Groundwater monitoring wells MW-10 and MW-11 were reported dry or had an insufficient amount of water to collect groundwater samples. Field data sheets illustrating onsite activities, including system or line volumes, actual purge volumes, purging equipment, and sampling equipment used are included in Appendix D.

3.7 MONITORING WELL SURVEYING

Mid Coast Engineers (MCE) was contracted by Stantec to survey the newly installed monitoring wells (MW-10, MW-11, MW-12B through MW-15B) and tied into existing well MW-7 at the site. The measurements were obtained from conventional survey techniques and GPS techniques, using data from existing wells MW-4 and MW-7 that was referenced to the NAVD 88 Datum. The wells were surveyed for geographical location to the NAD 83 (1986) Datum, and for well casing elevation to the NAVD 88 Datum. A copy of the MCE survey data is included in Appendix E.

3.8 INVESTIGATION DERIVED WASTE

Soil cuttings, decontamination rinsate, and purge water generated during the site assessment activities were stored in Department of Transportation (DOT) approved 55-gallon capacity steel drums. The drums, including 23 drums of soil from the drilling, 13 drums of water from the drilling, development, and sampling, and 2 drums of concrete and asphalt from the airknifing, were staged onsite pending laboratory characterization as non-hazardous waste. Belshire Environmental Services Inc. (BESI) transported the containers to their licensed facility for disposal on September 4, 2008. The waste manifest for the 23 drums of soil and 13 drums of water will be submitted under separate cover. The 2 drums of concrete and asphalt will be disposed of as construction waste.

4.0 Findings

4.1 SUBSURFACE CONDITIONS

Subsurface materials encountered at the site generally correlated well with those previously reported, as shown on the geologic cross sections, Figure 3, and boring logs, Appendix C. Silt with some silty sand and gravel intervals was encountered from the ground surface to depths of approximately 5 to 16 feet bgs. This silt was underlain by silty sand and gravel with minor silt interbeds to approximate depths of 15 to 25 feet bgs. Wells MW-10 and MW-11 (along with previously existing wells MW-6 and MW-9) appear to be screened in this first water bearing zone ranging between the approximate depths of 10 and 25 feet bgs. Beneath this water-bearing zone, a silt aquitard varying in thickness from approximately 0.5 to 14 feet thick was encountered. This aquitard was relatively continuous, except in the area of well MW-4, which may be within a channel deposit. The aquitard was very thin (1/2-foot) in MW-12B. The aquitard was underlain by a deeper water-bearing zone beginning at the approximate depths of 18 feet bgs in the site area and 13.5 feet bgs southeast of the site. Wells MW-12B through MW-15B (along with previously existing wells MW-4, MW-7, and MW-8) appear to be screened in this second water bearing zone. A potential aquitard beneath this deeper water-bearing zone was encountered between 27 and 29 feet bgs in MW-15B.

4.2 ANALYTICAL RESULTS

Soil and groundwater samples collected during the assessment were submitted to BC Laboratories (BCL), located in Bakersfield, California. Soil and groundwater analytical results are summarized in Tables 5 and 6. Laboratory reports, with certified analytical results and chain-of-custody documentation, are included in Appendix F.

4.2.1 Soil Analytical Results

Thirty soil samples were submitted for laboratory analysis from six monitoring well borings. Analytical results indicated the presence of TPPH in three borings (MW-12B, MW-13B, and MW-14B) at a maximum concentration of 3,500 mg/kg (MW-13B 15'); BTEX in borings MW-12B and MW-13B at maximum concentrations of 2.9 mg/kg, 250 mg/kg, 85 mg/kg, and 660 mg/kg (MW-13B 15'), respectively; TBA in well boring MW-13B at a concentration of 0.088 mg/kg (MW-13B 30.5'); and MTBE in well borings MW-12B and MW-13B at a maximum concentration of 0.030 mg/kg (MW-13B 24.5'). The remaining requested petroleum hydrocarbon constituents tested for under EPA Method 8260 were not detected at concentrations above the laboratory reporting limits.

4.2.2 Groundwater Analytical Results

Four low-flow groundwater samples were collected from monitoring wells MW-12B through MW-15B. Laboratory analysis indicated the presence of TPPH in three samples (MW-12B, MW-13B

and MW-15B), at a maximum concentration of 300 µg/L (MW-13B); benzene in one sample (MW-13B) at a concentration of 3.0 µg/L, toluene in one sample (MW-13B) at a concentration of 0.98 µg/L, ethylbenzene in one sample (MW-12B) at a concentration of 0.70 µg/L, xylenes in two samples (MW-12B and MW-13B) at a maximum concentration of 5.4 µg/L (MW-13B); and MTBE in two samples (MW-12B and MW-13B) at a maximum concentration of 13 µg/L (MW-13B. Groundwater samples were additionally analyzed for PCE, TCE and cis-1,2-DCE by EPA Method 8260B. Laboratory analysis indicated the presence of PCE, TCE and cis-1,2-DCE in four samples at maximum concentrations of 280 µg/L (MW-13B), 36 µg/L (MW-12B), and 41 µg/L (MW-12B), respectively. The samples were also analyzed for trans-1,2-DCE but this compound was not detected above the laboratory limit. The remaining requested petroleum hydrocarbon constituents analyzed for under EPA Method 8260B were not reported at concentrations above the laboratory reporting limits.

4.3 GROUNDWATER GRADIENT EVALUATION

On August 18, 2008, Stantec field staff collected depth to water readings in site wells prior to the sampling of the newly installed groundwater monitoring wells MW-10, MW-11 and MW-12B through MW-15B. These depth to water levels were used to calculate groundwater elevations and evaluate the groundwater gradient. The groundwater gradient was evaluated to flow to the east at a magnitude of 0.003 foot/foot (Figure 4). The groundwater gradient was also evaluated to flow to the east at a magnitude of 0.003 foot/foot in the deep water bearing zone, based on elevations excluding wells MW-6, MW-9 (dry), MW-10 (dry), and MW-11 (anomalous, likely due to water retained in the bottom of the well cap) (Figure 5). These gradients are consistent with historical gradients that have been evaluated at the site (Table 3, Figure 6). The gradient in the shallow zone could not be evaluated due to only two wells containing water.

It appears that there is hydraulic connection between the two water-bearing zones in the area of MW-4, in the limited area of the tank pit, possibly in other areas, and through the aquitard that separates the zones at the majority of locations explored. The one location where vertical gradient evaluation was possible (MW-6 and MW-13B) showed a vertical gradient of +0.01, indicating slight upward flow. This location is near the UST tank pit, which is interpreted to have been dug beneath the aquitard. As shown in Figures 4 and 5, the hydraulic gradient appears to be generally equilibrated throughout the well network.

4.4 GEOTRACKER UPLOAD

Data associated with this assessment report has been uploaded to the California State Geotracker database. Confirmation of this electronic submittal is included in Appendix G.

4.5 SENSITIVE RECEPTOR SURVEY

Stantec conducted a sensitive receptor survey within a ½-mile radius of the site between July 2008 and August 2008. A detailed parcel survey was performed at a 500-foot radius surrounding the site. The 500-foot radius site map and the survey results are illustrated on the attached Table 7 and Figure 7, and the ½-mile radius map is shown on Figure 8. The survey

procedures and results are summarized below. Survey questionnaires are included in Appendix H.

4.5.1 Agency Survey

Stantec obtained a Well Completion Report Release Agreement from the SMCEHD-GPP in August 2007 that allowed access to the well completion records at the DWR. Stantec contacted DWR on July 2, 2008 to obtain any additional well completion records that may have been added to the records since 2007. Research of the DWR well completion record database identified one irrigation well located approximately 2,208 feet north-northeast of the Site at 1015 2nd Avenue, San Mateo. The well was installed in 1953 to a depth of 46 feet bgs with a screened interval of 30 to 46 feet bgs. A copy of the Well Completion Report Release Agreement is included in Attachment I.

4.5.2 1996 Survey Results

The well survey performed by Pacific (1996) identified four wells within a ¼-mile radius of the site. This included three cathodic protection wells and one irrigation well. The irrigation well identified in this survey was within a ½ mile radius and was located approximately 250 feet northwest along El Camino from the 9th Ave intersection and approximately 450 feet northeast into Central Park. The date of installation was unknown, and the total depth was 130 feet bgs. The City of San Mateo was contacted to verify the presence of the irrigation well in Central Park. Communication with Mr. Soulard indicated that there are two irrigation wells in Central Park (approximately 2,544 feet south of the site) and one irrigation well at King Center (approximately 3,648 north-northwest of the site).

4.5.3 Water Service Purveyor

The California Water Service Company (Cal Water) was identified as the public water service purveyor for the City of San Mateo. The Cal Water district serving the San Mateo area was identified as the Bayshore District. The district purchases water from the San Francisco Public Utilities Commission (SFPUC) and provides water to the cities of San Mateo and San Carlos. Communication with Mr. Mark Johnson of the Cal Water Bayshore District indicated that the Bayshore District did not currently have water supply wells within the 1/2 -mile boundary of the survey area. Mr. Johnson also indicated that the district is looking to buy land and install wells in the future, possibly at a location approximately ¾-mile southeast of the site.

4.5.4 Surface Water Bodies and Other Receptors

There was one surface water body (San Mateo Creek) identified within the limits of the ½-mile survey, approximately 1,488 feet north of the site. Six schools, three daycares, fourteen churches, two parks, two assisted living facilites, one family services agency, and one hospital were identified within the search ½-mile radius. These potential receptors were located cross- or up-gradient to the site (Figure 8).

4.5.5 Parcel Survey

Stantec conducted a parcel survey of the residences and businesses within the 500-foot search radius by mailing questionnaires. Each questionnaire (Attachment I) was sent with a self addressed and stamped envelope, and a copy of a site plan illustrating the location of the parcel in relation to the site. The questionnaire was approved by the SMCEHD-GPP in their letter dated January 30, 2008. Prior to mailing the questionnaires, Stantec contacted the San Mateo County Assessor's Office to obtain property owner information for the parcels within the 500-foot search radius. If the property owner listed for the parcel had a mailing address that was not the parcel address, a questionnaire was sent to both the property owner and the tenant of the parcel.

Stantec submitted the first round of questionnaires on Tuesday, July 11, 2008. The recipients were given approximately two weeks to remit the questionnaires. On Friday, July 25, 2008, Stantec submitted another copy of the questionnaire to the property owners and tenants that had not responded within the first two weeks. Stantec received responses for a total of 45 of the 87 parcels that were identified within the 500-foot search radius. The questionnaires were printed single-sided, and several respondents only returned the first page. Copies of the returned questionnaires are included as Attachment I.

The responses identified 12 properties with basements, two properties with a sump, and no properties with groundwater wells within the 500-foot search radius, as shown on Figure 7. Two of the respondents (422 and 520 El Dorado St.) indicated upon further contact that their property did not have a basement, but a crawl space. Stantec verified the existence of a basement with the property owners at 712 4th Ave., 604, 610, 614, and 704 5th Ave., 518 El Dorado St., and 320 Delaware St. and attempted to verify the existence of the other three basements. Messages for the other property owners (421 El Dorado St., 514 Delaware St., and 622 5th Ave.) were not returned. The sumps were reported on residential property northwest and northeast of the site. The property owners both indicated that the sumps were primarily used during heavy rains. The property owner at 320 Delaware St. indicated upon further contact that the sump pumped surface water. The property owner at 712 4th Ave was unsure if the sump pumped groundwater or surface water. Property usage surrounding the site was primarily commercial; however, residential properties existed to the east and southeast of the site.

4.5.6 Field Canvas

Stantec field staff visited the site to verify parcel addresses, identify land use, look for wells and appurtenant facilities, and to search for additional receptors located within the 500-foot foot search radius. There were no discrepancies noted between the physical addresses of the properties and list of property addresses obtained from the San Mateo County Assessors Office. The land use was identified as a mixture of commercial and residential, and was verified on many of the returned questionnaires. Additionally, Stantec did not identify groundwater production wells, or appurtenant facilities associated with groundwater production wells, within the search radius.

5.0 Conclusions and Recommendations

The groundwater gradients evaluated using the previously existing and newly constructed wells, and the discreetly screened deep water-bearing zone wells, are consistent with previous gradients. It appears that there is hydraulic connection between the two water-bearing zones in the area of MW-4, in the limited area of the tank pit excavation, possibly in other areas, and through the aquitard that separates the zones at the majority of locations explored. As shown in Figures 4 and 5, the hydraulic gradient appears to be generally equilibrated throughout the well network.

Although the aquitard between the water-bearing zones appears to be leaky, based on soil and groundwater laboratory results from MW-6 and MW-13, it is helping to retard downward migration of hydrocarbons.

Shallow wells MW-10 and MW-11 did not contain water, most likely due to the late summer season; however, analysis of soil samples from the potential shallow water-bearing zone in these downgradient wells did not indicate the presence of petroleum hydrocarbons. The lateral extent of dissolved-phase hydrocarbons in the shallow water-bearing zone is delineated to the northwest, northeast, and southwest (upgradient and crossgradient) by borings and wells MW-9, MW-8, and MW-7. Stantec recommends that wells MW-10 and MW-11 be inspected for the presence of groundwater, and developed as necessary, prior to the first quarter 2009 semiannual monitoring and sampling event, to allow collection of a time-synchronous round of groundwater data from the shallow water-bearing zone, including downgradient wells, during that quarter. If concentrations in MW-6 remain at current levels, remediation in this area will be warranted.

The lateral extent of dissolved-phase hydrocarbons in deeper groundwater is delineated to relatively low concentrations to the southwest (crossgradient) by SP-7 and MW-7, and to the east and southeast (downgradient) by wells MW-4, MW-12B, and MW-15B. Concentrations of dissolved phase petroleum hydrocarbons in offsite soil boring SP-8 were not confirmed by the results from well MW-12B, which were more than two orders of magnitude lower. These concentrations should be verified by semiannual sampling and analysis.

Although PCE, TCE, and cis-1,2-DCE have been detected in groundwater, the site does not appear to be the source of these compounds. Stantec recommends that analysis for these compounds be discontinued.

Based on the distances and locations of the potential receptors upgradient and crossgradient of the site, Stantec does not recommend further investigation of these receptors. Based on the soil laboratory results from MW-10 and MW-11, Stantec does not recommend further investigation of the basements downgradient (east and southeast) of the site at this time. If groundwater from MW-10 and MW-11 is analyzed and found to contain petroleum

hydrocarbons, then Stantec will recommend further investigation and possibly vapor or groundwater sampling to confirm that hydrocarbons are not impacting the basements.

6.0 Limitations

This report was prepared in accordance with the scope of work outlined in Stantec's contract and with generally accepted professional environmental consulting practices existing at the time this report was prepared and applicable to the location of the site. It was prepared for the exclusive use of ConocoPhillips, for the express purpose stated above. Any re-use of this report for a different purpose or by others not identified above shall be at the user's sole risk without liability to Stantec. To the extent that this report is based on information provided to Stantec by third parties, Stantec may have made efforts to verify this third party information, but Stantec cannot guarantee the completeness or accuracy of this information. The opinions expressed and data collected are based on the conditions of the site existing at the time of the field investigation. No other warranties, expressed or implied are made by Stantec.

Notes:

<	Denotes less than Laboratory PQL	DIPE	Di-isopropyl ether	MTBE	Methyl tertiary butyl ether	TOG	Total oil and grease
bgs	below ground surface	EDB	Ethylene dibromide	PQL	Practical Quantitaion Limit	TPHd	Total petroleum hydrocarbons as diesel
mg/kg	milligrams per kilogram	EPA	Environmental Protection Agency	TAME	Tert-amyl methyl ether	TPPH	Total purgeable petroleum hydrocarbons
1,2-DCA	1,2-Dichloroethane	ETBE	Ethyl tertiary butyl ether	TBA	Tertiary butyl alcohol		

1 Analyzed by EPA Method 3550/8015M
2 Analyzed by Standard Method 5520 E&F (Gravimetric)
3 Analyzed by EPA Method 5030/8015M between 8/1992 and 3/1995; by EPA Method 8260 between 12/2006 and the present.
4 Analyzed by EPA Method 8020 between 8/1992 and 3/1995; by EPA Method 8260 between 12/2006 and the present.
5 Analyzed by EPA Method 8260B
6 Analyzed by EPA Method 6000/7000

a Sample was analyzed for Halogenated Volatile Organic Hydrocarbons (HVOCs) by EPA Method 8010. Tetrachloroethene was detected at 0.0064 mg/kg. The additional HVOCs were reported as non-detect.
b Chromatograph pattern: Diesel and non-diesel mixture (<C14; >C22).
c Sample was analyzed for HVOCs by EPA Method 8010. All HVOCs were reported as non-detect.
d The Continuing Calibration Verification (CCV) recovery was not within established control limits.
e The PQL'S and MDL's was raised due to sample dilution.
f Estimated Value (CLP Flags)

6 Analyzed by California LUFT Manual, 12/87.

a Chromatograph pattern: diesel and non-diesel mixture (<C16; >C22).
b The presence of MTBE was potentially identified at reportable levels.
c The presence of MTBE was identified at a level equal to or above the taste and odor threshold of 40 µg/L.
d The hydrocarbons detected appeared to be gasoline and a non-gasoline mixture.
e Chromatograph pattern: unidentified hydrocarbons C6-C12
f Chromatograph pattern: weathered gasoline: C6-C12
g Chromatograph pattern: discrete peaks C8-C12
h Chromatograph pattern: discrete peaks
i Sample was additionaly run under EPA Method 8260B. MTBE was detected at 1,140 µg/L. All other analytes were non-detect.
j Single analyte peak(s) were present in the requested fuel quantitation range. Fuel hydrocarbon pattern was not present.
k The concentration reported reflect(s) individual or discrete unidentified peaks not matching a typical fuel pattern.
l Chromatogram not typical of gasoline.
m TPPH was positive due to tetrachloroethane present in the sample.
n PQL's and MDL's were raised due to sample dilution.
o Tetrachloroethene was subtracted from the gasoline range TPH.
p The Continuing Calibration Verification (CCV) recovery was not within established control limits.
q The BC laboratory report indicated that reported concentration of 200 µg/L TPPH was due only to the presence of 90 µg/L PCE, 15 µg/L trichloroethane, and 9.8 µg/L cis-1,2-DCA; therefore, SECOR has represented the results for TPPH in this laboratory report as non-detect.
r Sample also analyzed for trans-1,2-dichloroethene; non detect above 0.5 µg/L.
s PCE, TCE, and 1,2-DCE were subtracted from the gasoline range TPPH.
t Samples hold time was exceeded.
u Depth to GW was collected on 9/28/2007 and sample was collected on 8/30/2007
v Not enough sample to re-run for PCE.
