1.0 Introduction

This report has been prepared by Stantec Consulting Corporation (Stantec) on behalf of the ConocoPhillips Company (ConocoPhillips), to further investigate subsurface conditions beneath 76 Service Station No. 6390, located at 402 South Delaware Street, San Mateo, California (the "site", Figure 1). The work was done in accordance with Stantec's *Additional Assessment and Sensitive Receptor Survey Work Plan*, dated July 9, 2007 and Stantec's *Revisions to Additional Assessment and Sensitive Receptor Survey Work Plan*, dated March 25, 2008. The work plans were approved with modifications in letters from the San Mateo County Health Department – Groundwater Protection Program (SMCHD-GPP) dated January 30, 2008 and July 28, 2008 (Appendix A). Verbal approval was provided by the SMCHD-GPP on July 11, 2008 to move forward with the work proposed in the revised work plan.

2.0 Site Background

2.1 SITE LOCATION

The 76 branded Service Station property (the "site") is located at 402 South Delaware Street, on the south corner of South Delaware Street and East Fourth Avenue in the City of San Mateo, San Mateo County, California (Figure 1). The site is bordered by South Delaware Street to the northeast, East Fourth Avenue to the northwest, and commercial buildings to the southwest and southeast. There are two active gasoline service stations located in the near vicinity: a Shell station on the north corner of East Third Avenue and South Delaware Street, and an ARCO station on the south corner of East Third Avenue and South Delaware Street. Historically, there used to be a Shell service station directly across South Delaware Street from the site on the east corner of South Delaware Street and East Fourth Avenue; a Jiffy Lube now exists at this location. Additionally, a former 76 branded service station was located on the west corner of East Third Avenue and El Dorado Street.

The site is an active service station dispensing 76 branded gasoline. The station facilities include two unleaded gasoline underground storage tanks (USTs) located in a common pit in the southeast portion of the property, three product dispenser islands, and a station building (Figure 2). The USTs were installed at the site in August 1992 during station upgrade activities. A 550-gallon waste oil UST formerly located behind the station building was removed from the site when the current gasoline USTs were installed.

2.2 SITE HISTORY

In August 1992, Kaprealian Engineering, Inc. (KEI) observed the removal of two 12,000-gallon capacity, fiberglass, gasoline underground storage tanks (USTs), one 550-gallon waste oil UST, and the associated product piping and dispensers. A 9-inch long crack was observed along the eastern end of the super unleaded gasoline UST upon removal. Subsequent petroleum hydrocarbon contamination was observed at the eastern end of the gasoline UST cavity. The cavity was over-excavated to remove as much of the impacted soil as possible, resulting in a final excavation that measured approximately 30 feet long by 27 feet wide by 22 feet deep. Initially, six soil samples were collected (A1, A2, B1, B2, SW1, and SW2) from the bottom and sidewalls of the UST cavity, one soil sample (WO1) was collected from the bottom of the waste oil UST cavity, and six soil samples (P1, P2, P3, P4, P5, and P6) were collected from the bottom of the product piping trenches. KEI returned at a later date to collect an additional three samples (SW1(2.5), SW2(2.5), and SW3) from the gasoline UST cavity and a grab water sample (W1). The water sample was collected after a total of approximately 5,800 gallons of water had been pumped form the gasoline UST cavity. The groundwater was observed to have floating product and a heavy sheen. Additionally, KEI collected three soil samples (D1, D2 , and D3) from beneath the gasoline dispensers. Laboratory analysis of soil samples collected from the gasoline UST cavity indicated the presence of up to 5,000 milligrams per kilogram (mg/kg) total petroleum hydrocarbons as gasoline (TPHg, B2), 47 mg/kg benzene (B2), 470 mg/kg

toluene (B2), 120 mg/kg ethylbenzene (B2), 790 mg/kg total xylenes (B2), and 5.9 mg/kg total petroleum hydrocarbons as diesel (TPHd, SW3). The requested petroleum hydrocarbon constituents were not reported above laboratory detection limits in the soil samples collected from the product piping trenches and from beneath the gasoline dispensers. Laboratory analysis of the soil sample from the waste oil UST indicated the presence of the heavy metals cadmium, chromium, nickel, lead and zinc at concentrations of 1.1 mg/kg, 67 mg/kg, 73 mg/kg, 6.0 mg/kg, and 44 mg/kg, respectively, while the remaining petroleum hydrocarbon constituents were not indicated at concentrations above the laboratory detection limits. Analysis of the water sample collected from the gasoline UST indicated 28,000 micrograms per liter (µg/L) TPHd, 50,000 µg/L TPHg, 1,200 µg/L benzene, 6,700 µg/L toluene, 1,400 µg/L ethylbenzene, and 10,000 µg/L total xylenes. Laboratory results are included in Table 1 (KEI, 1992).

In May 1994, KEI installed three monitoring wells (MW1, MW2, and MW3, later known as MW-1, MW-2 and MW-3) at the site (Figure 2). Laboratory analysis of the soil samples collected from the borings for monitoring wells MW-2 and MW-3 indicated the presence of TPHg and benzene, toluene, ethylbenzene, and total xylenes (BTEX) at maximum concentrations of 2,600 mg/kg TPHg (MW2 (17)), 26 mg/kg benzene (MW2 (15)), 240 mg/kg toluene (MW2 (15)), 62 mg/kg ethylbenzene (MW2 (17)), and 410 mg/kg total xylenes (MW2 (17)). The requested petroleum hydrocarbon constituents were not reported above laboratory detection limits in the soil samples collected form the MW-1 borehole. The wells were initially monitored and sampled in June 1994. Laboratory analysis of the water samples collected indicated the presence of petroleum hydrocarbons in MW-2 and MW-3, with maximum concentrations of 89,000 µg/L TPHg, 11,000 µg/L benzene, 37,000 µg/L toluene, 3,000 µg/L ethylbenzene, and 20,000 µg/L total xylenes reported in MW-2. The depth to water ranged from 15.33 to 16.71 feet below ground surface (bgs), with the evaluated groundwater gradient being approximately 0.004 foot/foot to the east. KEI concluded to follow a three month monitoring program, at which point the wells would be re-sampled. Laboratory results are included in Tables 1 and 2 (KEI, 1994).

In March 1995, two additional monitoring wells (MW4 and MW5, later known as MW-4 and MW-5) were installed in offsite locations in the sidewalk along the opposite side of South Delaware Street form the site (Figure 2). The offsite wells were located in the down-gradient direction from the site. Laboratory analysis of the soil samples collected from the monitoring well boreholes indicated the presence of TPHg and BTEX at maximum concentrations of 600 mg/kg TPHg, 3.3 mg/kg benzene, 38 mg/kg toluene, 14 mg/kg ethylbenzene, and 96 mg/kg total xylenes in soil sample MW4 (5). The new wells were added to the quarterly groundwater monitoring and sampling program, and were first sampled in April 1995. Laboratory analysis of the water samples collected from MW-4 and MW-5 indicated the presence of maximum concentrations of 150,000 µg/L TPHg, 12,000 µg/L benzene, 40,000 µg/L toluene, 4,700 µg/L ethylbenzene, and 31,000 µg/L total xylenes reported in MW-4. Laboratory results are included in Tables 1 and 2 (KEI, 1995).

In January 1996, GeoStrategies (GSI) observed the excavation and removal of a 150 gallon capacity oil/water separator. A confirmation soil sample (OWS-S-4.5) was collected from underneath the oil/water separator at a depth of 4.5 feet bgs. Laboratory analysis of the sample

indicated the presence of trace concentrations of TPHd, toluene, and total xylenes at 1.5 mg/kg, 0.006 mg/kg, and 0.009 mg/kg, respectively. Additionally, the presence of the heavy metals chromium, nickel, lead, and zinc were indicated at concentrations of 160 mg/kg, 99 mg/kg, 13 mg/kg, and 69 mg/kg, respectively. The remaining requested petroleum hydrocarbon constituents were not reported above laboratory detection limits. Laboratory results are included in Table 1 (GSI, 1996).

In February 1996, KEI supervised the advancement of three Geoprobe® soil borings (SP1, SP2, and SP4) at offsite locations (Figure 2). The soil borings were terminated at a depth of 13 feet bgs, with groundwater encountered at approximately 10.5 feet bgs. Grab water samples were collected from each borehole. Laboratory analysis of the water samples indicated the presence of TPHg, benzene, ethylbenzene, and total xylenes in the sample from boring SP-4 at concentrations of 450 µg/L, 71 µg/L, 6.7 µg/L, and 17 µg/L, respectively. The requested petroleum hydrocarbon constituents were not reported above laboratory detection limits in the groundwater samples from borings SP-1 and SP-2. A summary of laboratory results is included in Table 2 (KEI, 1996).

In June 1996, Pacific Environmental Group, Inc. (Pacific) performed a well survey and reviewed California Department of Water Resources (DWR) well records. Four documented wells were identified within a ¼-mile radius of the site (Pacific, 1996).

In December 2006 and January 2007, SECOR supervised the advancement of four direct push soil borings (SP-5 through SP-8), the installation of three soil vapor wells (VP-1 through VP-3) and four groundwater monitoring wells (MW-6 through MW-9), and the destruction of four groundwater monitoring wells (MW-1, MW-2, MW-3, and MW-5) (Figure 2). Laboratory analysis of the soil samples collected indicated the presence of up to 1,300 mg/kg total purgeable petroleum hydrocarbons (TPPH, MW-6@16.5-17), 0.18 mg/kg benzene (MW-6@11-11.5), 32 mg/kg toluene (MW-6@11-11.5), 20 mg/kg ethylbenzene (MW-6@11-11.5), 110 mg/kg total xylenes (MW-6@11-11.5), and 0.089 mg/kg methyl tertiary butyl ether (MTBE, MW-6@19.5-20). Grab sample analytical results indicated the presence of up to 51,000 µg/L TPPH (SP-8), 1,300 µg/L benzene (SP-5), 1,500 µg/L toluene (SP-5), 3,000 µg/L ethylbenzene (SP-8), 9,600 µg/L total xylenes (SP-8), and 330 µg/L MTBE (SP-5). Groundwater samples from the wells contained petroleum hydrocarbons in MW-6 (67,000 µg/L TPPH, 380 µg/L benzene, 8,600 µg/L toluene, 3,600 µg/L ethylbenzene, 17,000 µg/L total xylenes, and 62 µg/L MTBE), and MW-9 (0.73 µg/L xylenes). Laboratory analysis of the soil vapor samples indicated the presence of up to 0.75 micrograms per liter (µg/L) TPPH (VP-3), up to 16 µg/L toluene (VP-1), 14 µg/L ethylbenzene (VP-3), 42 µg/L m,p-xylenes (VP-3), and 29 µg/L o-xylenes (VP-3). The laboratory analysis additionally indicated that the samples were composed of 20-22% O_2 and 0.46-1.0% CO_2. SECOR concluded that hydrocarbons in soil had been adequately delineated, the lateral extent of hydrocarbons in groundwater had been delineated up-gradient and cross-gradient, the lateral extent of hydrocarbons in deeper groundwater had been delineated to the southwest (cross-gradient) by SP-7, and that vapor inhalation did not appear to be an exposure pathway at the site. SECOR recommended a down-gradient well in the shallow water bearing zone, down-gradient wells in deeper groundwater along East Fifth Avenue and Delaware Street,

wells in deeper groundwater northwest and northeast (up and cross-gradient) of the site, analysis for PCE, and historical research to investigate a source for the PCE (SECOR, 2007).

The site has been monitored and sampled since the second quarter 1994. From 1994 to 2000, the site was monitored on a quarterly basis. Since 2001, the frequency has been reduced to semi-annual monitoring and sampling. Historically, the highest dissolved phase petroleum hydrocarbon concentrations have occurred in wells MW-2 and MW-3, and most recently in well MW-6. The groundwater gradient has been mainly to the east and southeast, and was to the northeast during the last event (SECOR, 2008). Laboratory results are included in Table 2.

Historical soil and groundwater sampling locations are shown on Figure 2, and historical soil, groundwater, gradient, and soil vapor data are summarized in Tables 1 through 4.

3.0 Scope of Work

On July 31, 2008 through August 11, 2008, Stantec field staff observed WDC Drilling (WDC) of Martinez, California, install two shallow monitoring wells (MW-10 and MW-11) and four deep groundwater monitoring wells (MW-12B, MW-13B, MW-14B, and MW-15B). On August 14 and 15, 2008, Stantec observed WDC develop the groundwater monitoring wells. On August 18, 2008 Stantec purged and sampled wells MW-12B, MW-13B, MW-14B, and MW-15B. Wells MW-10 and MW-11 were observed as dry and not sampled. On August 18, 2008, Stantec witnessed the surveying of MW-10, MW-11, MW-12B, MW-13B, MW-14B, and MW-15B and measured groundwater elevations in the site wells. The completed scope of work is discussed below. Additionally, Stantec performed a sensitive receptor survey to help evaluate the site for low-risk closure.

3.1 SITE HEALTH AND SAFETY PLAN

As required by the Occupational Health and Safety Administration Standard "Hazardous Waste Operations and Emergency Response" guidelines (29 CFR 1910.120), and by the California Occupational Health and Safety Administration "Hazardous Waste Operations and Emergency Response" guidelines (CCR Title 8, Section 5192), Stantec updated the current site-specific Health and Safety Plan (HASP) prior to the commencement of fieldwork. The HASP was reviewed by field staff and contractors before beginning field operations, and was in the possession of Stantec personnel while conducting work activities at the site.

3.2 PERMITTING

Prior to installing the groundwater monitoring wells, Stantec obtained a rider to an open encroachment permit from the City of San Mateo Department of Public Works for the advancement of five offsite monitoring wells (MW-10, MW-11, MW-12B, MW-14B, and MW-15B). The rider to the encroachment permit was approved on July 23, 2008. Stantec also obtained two exploratory boring permits from the SMCHD-GPP for the advancement of one onsite groundwater monitoring well and five offsite groundwater monitoring wells on City property, which were approved on July 23, 2008. Copies of the permits are included in Appendix A.

3.3 SUBSURFACE UTILITY CLEARANCE AND CONDUIT STUDY

Prior to initiating field activities on July 24, 2008, Stantec marked the boring locations (MW-10, MW-11, MW-12B, MW-13B, MW-14B, and MW-15B), contacted Underground Service Alert (USA) 48 hours prior to the initiation of field work, and contracted Cruz Brothers Locators (CBL), a private utility locator, to evaluate whether the proposed boring locations were clear of potential subsurface obstructions.

Monitoring wells MW-11, MW-12B, MW-13B, and MW-15B were cleared to depths of 5 feet bgs using an air lance and vacuum truck prior to commencement of mechanical drilling. On August 1, 2008, while clearing MW-10, a potential storm drain was encountered in South Delaware Street. The City of San Mateo was contacted and verified that there was a storm drain in that vicinity. Permission was granted by the City to move MW-10 and MW-14B into the sidewalk. CBL cleared the new locations and did not identify potential subsurface utilities beneath the proposed locations of the wells. Monitoring wells MW-10 and MW-14B were cleared to depths of 6.5 and 8 feet bgs, respectively, using a hand auger and an air lance and vacuum, prior to commencement of mechanical drilling.

3.4 GROUNDWATER MONITORING WELL INSTALLATION

On July 31 through August 11, 2008, two shallow groundwater monitoring wells (MW-10 and MW-11) and four deep groundwater monitoring wells (MW-12B, MW-13B, MW-14B, and MW-15B) were installed using a limited access HSA rig equipped with 8 inch to 18 inch diameter auger flights. Monitoring wells MW-10 and MW-14B were installed offsite in the sidewalk along South Delaware Street northeast and east of the site. Monitoring wells MW-11 and MW-15B were installed offsite in the parking lane along South Delaware Street southeast of the site. MW-12B was installed in the parking lane along East Fifth Avenue east of the site, and MW-13B was installed onsite near MW-6.

3.4.1 Shallow Groundwater Monitoring Wells

The shallow groundwater monitoring well borings MW-10 and MW-11 were advanced to depths of 17.5 and 15 feet bgs, respectively. Groundwater was not encountered in the borings for the shallow wells during drilling.

The shallow monitoring wells were constructed using 2-inch diameter poly vinyl chloride (PVC) casing with a 0.020-inch slotted screen interval extending from 6 to 13.5 feet bgs in MW-10 and 5 to 15 feet bgs in MW-11. A filter pack of #3 Monterey sand was placed in the annulus across from the screen to 0.5 -1.0 feet above the screen. A 1.5-2.0 foot thick bentonite seal (hydrated chips) was placed above the sand pack. Neat cement grout (mixed at a ratio of 6 gallons of water per 94 pounds of Portland cement) was tremmied from the top of the bentonite seal to 1 foot bgs. The well materials were tremmied through the annulus of the HSA flights. The wells were completed at the surface with traffic rated well boxes set in concrete dyed to match the existing grade, and a locking well cap was placed on the casing. Because a potential aquitard was encountered at the bottom of the borehole for monitoring well MW-10, a bentonite seal was emplaced within this fine-grained material at the bottom of the borehole prior to well construction. This potential aquitard was not penetrated through during the drilling operations.

3.4.2 Deep Groundwater Monitoring Wells

The deep groundwater monitoring well borings MW-12B, MW-13B, MW-14B and MW-15B were advance to depths of 30, 31, 29, and 29 feet bgs, respectively. Groundwater was encountered between16.25 feet and 18.79 feet bgs surface in the deep wells.

The deep monitoring wells were constructed using 2-inch diameter poly vinyl chloride (PVC) casing with a 0.020-inch slotted screen interval extending from 19 to 29 feet bgs in MW-12B, 21 to 31 feet bgs in MW-13B, 18.75 to 28.75 feet bgs in MW-14B, and 17 to 27 feet bgs in MW-15B. A filter pack of #3 Monterey sand was placed in the annulus across from the screen to 0.1 -1.0 feet above the screen. A 2.0-2.4 foot thick bentonite seal (hydrated chips) was placed above the sand pack. Neat cement grout (mixed at a ratio of 6 gallons of water per 94 pounds of Portland cement) was tremmied from the top of the bentonite seal to 1 foot bgs. The well materials were tremmied through the annulus of the HSA flights. The wells were completed at the surface with a traffic rated well box set in concrete dyed to match the existing grade, and a locking well cap was placed on the casing. Because a potential aquitard was encountered at the bottom of the borehole for monitoring well MW-15B, a bentonite seal was emplaced within this fine-grained material at the bottom of the borehole prior to well construction. This potential aquitard was not penetrated through during the drilling operations.

Because free groundwater was encountered in the shallow zone at the locations of MW-12B and MW-13B, conductor casing was emplaced in the shallow zone of these borings prior to advancement to the deeper zone. The 10-inch diameter steel conductor casing was installed in the boring approximately 1.5 inches (MW-12B) and 1 foot (MW-13B) into the underlying aquitard and grouted in place and allowed to cure for 72 hours prior to advancement through the casing. Free groundwater was not encountered within the shallow zone of MW-14B and MW-15B, therefore, the use of conductor casing was not necessary.

Stantec's field procedures are included in Appendix B. The boring logs illustrating well construction details are included in Appendix C.

3.5 SOIL SAMPLE COLLECTION AND ANALYSIS

The soil borings were continuously sampled and described in accordance with the Unified Soil Classification System (USCS) by a Stantec scientist under the direction of a California Professional Geologist. Soil samples were contained in brass liners that were inserted into the sampler. Soil samples were examined for odors, visible signs of petroleum hydrocarbons, and screened for hydrocarbon vapors using a photo-ionization detector (PID). Unsaturated and saturated soil samples showing positive readings on a photo-ionization detector (PID) and collected from within encountered zones of low permeability (potential aquitards) were analyzed. Selected soil samples were placed on ice and submitted to a California certified laboratory to be analyzed for the presence of total purgeable petroleum hydrocarbons (TPPH); benzene, toluene, ethylbenzene and total xylenes (BTEX); 1,2-dichloroethane (1,2-DCA), di-isopropyl ether (DIPE), ethylene dibromide (EDB), ethyl tertiary butyl ether (ETBE), ethanol, MTBE, tertiary amyl methyl ether (TAME), and tertiary butyl alcohol (TBA) by Environmental Protection Agency (EPA) Method 8260.

Stantec's standard field procedures are included in Appendix B.

3.6 MONITORING WELL DEVELOPMENT, SAMPLING, AND ANALYSIS

On August 14 and 15, 2008, Stantec personnel developed the newly installed monitoring wells MW-12B through MW-15B. Approximately 10.1-10.6 casing volumes were purged from the wells. The last three successive measurements of temperature, conductivity, and pH of the purged groundwater varied by ≤10%, ≤6%, and ≤0.1, respectively. On August 14, 2008, Stantec personnel noted that pH parameters were very low and recalibrated the meter. A new meter was available and used for the second day of well development. Development was deemed to be sufficient once 10 casing volumes were removed. Groundwater monitoring wells MW-10 and MW-11 were reported as dry and not developed.

On August 18, 2008, Stantec personnel purged and sampled groundwater monitoring wells MW-12B through MW-15B using low-flow protocol at a flow rate of less than 1 liter per minute using a bladder pump. The pump intake was placed at a depth in the water column that was opposite the portion of the saturated zone expected to contain the greatest hydrocarbon impact. Criteria for this selection included the depth of the highest soil impact encountered during well installation, the as-built screen interval, and the recorded depth to water. For wells MW-12B, MW-13B, and MW-14B, because the screens were submerged and there was no known soil impact, the pump intake was placed at the top of the screen interval. Because the well MW-15B was observed to have an exposed screen, and no hydrocarbon compounds were known to be present in soil within the screened interval, the proposed intake depth was the center of the observed water column. The conductivity, temperature, and pH of the delivered effluent were monitored every three minutes using a flow-through cell during purging and recorded on the field data sheets. Purging ended once three successive measurements of pH, conductivity, and temperature of the purged water stabilized to within 0.1, 3%, and 10%, respectively. The samples were analyzed for TPPH, BTEX, MTBE, ethanol, TBA, TAME, DIPE, ETBE, EDB, and 1,2-DCA by EPA Method 8260B, and PCE (tetrachloroethene), TCE (trichloroethene) and 1,2-DCE (1,2-dichloroethene) by EPA 8260B. Groundwater monitoring wells MW-10 and MW-11 were reported dry or had an insufficient amount of water to collect groundwater samples. Field data sheets illustrating onsite activities, including system or line volumes, actual purge volumes, purging equipment, and sampling equipment used are included in Appendix D.

3.7 MONITORING WELL SURVEYING

Mid Coast Engineers (MCE) was contracted by Stantec to survey the newly installed monitoring wells (MW-10, MW-11, MW-12B through MW-15B) and tied into existing well MW-7 at the site. The measurements were obtained from conventional survey techniques and GPS techniques, using data from existing wells MW-4 and MW-7 that was referenced to the NAVD 88 Datum. The wells were surveyed for geographical location to the NAD 83 (1986) Datum, and for well casing elevation to the NAVD 88 Datum. A copy of the MCE survey data is included in Appendix E.

3.8 INVESTIGATION DERIVED WASTE

Soil cuttings, decontamination rinsate, and purge water generated during the site assessment activities were stored in Department of Transportation (DOT) approved 55-gallon capacity steel drums. The drums, including 23 drums of soil from the drilling, 13 drums of water from the drilling, development, and sampling, and 2 drums of concrete and asphalt from the airknifing, were staged onsite pending laboratory characterization as non-hazardous waste. Belshire Environmental Services Inc. (BESI) transported the containers to their licensed facility for disposal on September 4, 2008. The waste manifest for the 23 drums of soil and 13 drums of water will be submitted under separate cover. The 2 drums of concrete and asphalt will be disposed of as construction waste.

4.0 Findings

4.1 SUBSURFACE CONDITIONS

Subsurface materials encountered at the site generally correlated well with those previously reported, as shown on the geologic cross sections, Figure 3, and boring logs, Appendix C. Silt with some silty sand and gravel intervals was encountered from the ground surface to depths of approximately 5 to 16 feet bgs. This silt was underlain by silty sand and gravel with minor silt interbeds to approximate depths of 15 to 25 feet bgs. Wells MW-10 and MW-11 (along with previously existing wells MW-6 and MW-9) appear to be screened in this first water bearing zone ranging between the approximate depths of 10 and 25 feet bgs. Beneath this water-bearing zone, a silt aquitard varying in thickness from approximately 0.5 to 14 feet thick was encountered. This aquitard was relatively continuous, except in the area of well MW-4, which may be within a channel deposit. The aquitard was very thin (1/2-foot) in MW-12B. The aquitard was underlain by a deeper water-bearing zone beginning at the approximate depths of 18 feet bgs in the site area and 13.5 feet bgs southeast of the site. Wells MW-12B through MW-15B (along with previously existing wells MW-4, MW-7, and MW-8) appear to be screened in this second water bearing zone. A potential aquitard beneath this deeper water-bearing zone was encountered between 27 and 29 feet bgs in MW-15B.

4.2 ANALYTICAL RESULTS

Soil and groundwater samples collected during the assessment were submitted to BC Laboratories (BCL), located in Bakersfield, California. Soil and groundwater analytical results are summarized in Tables 5 and 6. Laboratory reports, with certified analytical results and chain-of-custody documentation, are included in Appendix F.

4.2.1 Soil Analytical Results

Thirty soil samples were submitted for laboratory analysis from six monitoring well borings. Analytical results indicated the presence of TPPH in three borings (MW-12B, MW-13B, and MW-14B) at a maximum concentration of 3,500 mg/kg (MW-13B 15'); BTEX in borings MW-12B and MW-13B at maximum concentrations of 2.9 mg/kg, 250 mg/kg, 85 mg/kg, and 660 mg/kg (MW-13B 15'), respectively; TBA in well boring MW-13B at a concentration of 0.088 mg/kg (MW-13B 30.5'); and MTBE in well borings MW-12B and MW-13B at a maximum concentration of 0.030 mg/kg (MW-13B 24.5'). The remaining requested petroleum hydrocarbon constituents tested for under EPA Method 8260 were not detected at concentrations above the laboratory reporting limits.

4.2.2 Groundwater Analytical Results

Four low-flow groundwater samples were collected from monitoring wells MW-12B through MW-15B. Laboratory analysis indicated the presence of TPPH in three samples (MW-12B, MW-13B

and MW-15B), at a maximum concentration of 300 µg/L (MW-13B); benzene in one sample (MW-13B) at a concentration of 3.0 µg/L, toluene in one sample (MW-13B) at a concentration of 0.98 µg/L, ethylbenzene in one sample (MW-12B) at a concentration of 0.70 µg/L, xylenes in two samples (MW-12B and MW-13B) at a maximum concentration of 5.4 µg/L (MW-13B); and MTBE in two samples (MW-12B and MW-13B) at a maximum concentration of 13 µg/L (MW-13B. Groundwater samples were additionally analyzed for PCE, TCE and cis-1,2-DCE by EPA Method 8260B. Laboratory analysis indicated the presence of PCE, TCE and cis-1,2-DCE in four samples at maximum concentrations of 280 µg/L (MW-13B), 36 µg/L (MW-12B), and 41 µg/L (MW-12B), respectively. The samples were also analyzed for trans-1,2-DCE but this compound was not detected above the laboratory limit. The remaining requested petroleum hydrocarbon constituents analyzed for under EPA Method 8260B were not reported at concentrations above the laboratory reporting limits.

4.3 GROUNDWATER GRADIENT EVALUATION

On August 18, 2008, Stantec field staff collected depth to water readings in site wells prior to the sampling of the newly installed groundwater monitoring wells MW-10, MW-11 and MW-12B through MW-15B. These depth to water levels were used to calculate groundwater elevations and evaluate the groundwater gradient. The groundwater gradient was evaluated to flow to the east at a magnitude of 0.003 foot/foot (Figure 4). The groundwater gradient was also evaluated to flow to the east at a magnitude of 0.003 foot/foot in the deep water bearing zone, based on elevations excluding wells MW-6, MW-9 (dry), MW-10 (dry), and MW-11 (anomalous, likely due to water retained in the bottom of the well cap) (Figure 5). These gradients are consistent with historical gradients that have been evaluated at the site (Table 3, Figure 6). The gradient in the shallow zone could not be evaluated due to only two wells containing water.

It appears that there is hydraulic connection between the two water-bearing zones in the area of MW-4, in the limited area of the tank pit, possibly in other areas, and through the aquitard that separates the zones at the majority of locations explored. The one location where vertical gradient evaluation was possible (MW-6 and MW-13B) showed a vertical gradient of +0.01, indicating slight upward flow. This location is near the UST tank pit, which is interpreted to have been dug beneath the aquitard. As shown in Figures 4 and 5, the hydraulic gradient appears to be generally equilibrated throughout the well network.

4.4 GEOTRACKER UPLOAD

Data associated with this assessment report has been uploaded to the California State Geotracker database. Confirmation of this electronic submittal is included in Appendix G.

4.5 SENSITIVE RECEPTOR SURVEY

Stantec conducted a sensitive receptor survey within a ½-mile radius of the site between July 2008 and August 2008. A detailed parcel survey was performed at a 500-foot radius surrounding the site. The 500-foot radius site map and the survey results are illustrated on the attached Table 7 and Figure 7, and the ½-mile radius map is shown on Figure 8. The survey

procedures and results are summarized below. Survey questionnaires are included in Appendix H.

4.5.1 Agency Survey

Stantec obtained a Well Completion Report Release Agreement from the SMCEHD-GPP in August 2007 that allowed access to the well completion records at the DWR. Stantec contacted DWR on July 2, 2008 to obtain any additional well completion records that may have been added to the records since 2007. Research of the DWR well completion record database identified one irrigation well located approximately 2,208 feet north-northeast of the Site at 1015 2nd Avenue, San Mateo. The well was installed in 1953 to a depth of 46 feet bgs with a screened interval of 30 to 46 feet bgs. A copy of the Well Completion Report Release Agreement is included in Attachment I.

4.5.2 1996 Survey Results

The well survey performed by Pacific (1996) identified four wells within a ¼-mile radius of the site. This included three cathodic protection wells and one irrigation well. The irrigation well identified in this survey was within a ½ mile radius and was located approximately 250 feet northwest along El Camino from the 9th Ave intersection and approximately 450 feet northeast into Central Park. The date of installation was unknown, and the total depth was 130 feet bgs. The City of San Mateo was contacted to verify the presence of the irrigation well in Central Park. Communication with Mr. Soulard indicated that there are two irrigation wells in Central Park (approximately 2,544 feet south of the site) and one irrigation well at King Center (approximately 3,648 north-northwest of the site).

4.5.3 Water Service Purveyor

The California Water Service Company (Cal Water) was identified as the public water service purveyor for the City of San Mateo. The Cal Water district serving the San Mateo area was identified as the Bayshore District. The district purchases water from the San Francisco Public Utilities Commission (SFPUC) and provides water to the cities of San Mateo and San Carlos. Communication with Mr. Mark Johnson of the Cal Water Bayshore District indicated that the Bayshore District did not currently have water supply wells within the 1/2 -mile boundary of the survey area. Mr. Johnson also indicated that the district is looking to buy land and install wells in the future, possibly at a location approximately ¾-mile southeast of the site.

4.5.4 Surface Water Bodies and Other Receptors

There was one surface water body (San Mateo Creek) identified within the limits of the ½-mile survey, approximately 1,488 feet north of the site. Six schools, three daycares, fourteen churches, two parks, two assisted living facilites, one family services agency, and one hospital were identified within the search ½-mile radius. These potential receptors were located cross- or up-gradient to the site (Figure 8).

4.5.5 Parcel Survey

Stantec conducted a parcel survey of the residences and businesses within the 500-foot search radius by mailing questionnaires. Each questionnaire (Attachment I) was sent with a self addressed and stamped envelope, and a copy of a site plan illustrating the location of the parcel in relation to the site. The questionnaire was approved by the SMCEHD-GPP in their letter dated January 30, 2008. Prior to mailing the questionnaires, Stantec contacted the San Mateo County Assessor's Office to obtain property owner information for the parcels within the 500-foot search radius. If the property owner listed for the parcel had a mailing address that was not the parcel address, a questionnaire was sent to both the property owner and the tenant of the parcel.

Stantec submitted the first round of questionnaires on Tuesday, July 11, 2008. The recipients were given approximately two weeks to remit the questionnaires. On Friday, July 25, 2008, Stantec submitted another copy of the questionnaire to the property owners and tenants that had not responded within the first two weeks. Stantec received responses for a total of 45 of the 87 parcels that were identified within the 500-foot search radius. The questionnaires were printed single-sided, and several respondents only returned the first page. Copies of the returned questionnaires are included as Attachment I.

The responses identified 12 properties with basements, two properties with a sump, and no properties with groundwater wells within the 500-foot search radius, as shown on Figure 7. Two of the respondents (422 and 520 El Dorado St.) indicated upon further contact that their property did not have a basement, but a crawl space. Stantec verified the existence of a basement with the property owners at 712 4th Ave., 604, 610, 614, and 704 5th Ave., 518 El Dorado St., and 320 Delaware St. and attempted to verify the existence of the other three basements. Messages for the other property owners (421 El Dorado St., 514 Delaware St., and 622 5th Ave.) were not returned. The sumps were reported on residential property northwest and northeast of the site. The property owners both indicated that the sumps were primarily used during heavy rains. The property owner at 320 Delaware St. indicated upon further contact that the sump pumped surface water. The property owner at 712 4th Ave was unsure if the sump pumped groundwater or surface water. Property usage surrounding the site was primarily commercial; however, residential properties existed to the east and southeast of the site.

4.5.6 Field Canvas

Stantec field staff visited the site to verify parcel addresses, identify land use, look for wells and appurtenant facilities, and to search for additional receptors located within the 500-foot foot search radius. There were no discrepancies noted between the physical addresses of the properties and list of property addresses obtained from the San Mateo County Assessors Office. The land use was identified as a mixture of commercial and residential, and was verified on many of the returned questionnaires. Additionally, Stantec did not identify groundwater production wells, or appurtenant facilities associated with groundwater production wells, within the search radius.

5.0 Conclusions and Recommendations

The groundwater gradients evaluated using the previously existing and newly constructed wells, and the discreetly screened deep water-bearing zone wells, are consistent with previous gradients. It appears that there is hydraulic connection between the two water-bearing zones in the area of MW-4, in the limited area of the tank pit excavation, possibly in other areas, and through the aquitard that separates the zones at the majority of locations explored. As shown in Figures 4 and 5, the hydraulic gradient appears to be generally equilibrated throughout the well network.

Although the aquitard between the water-bearing zones appears to be leaky, based on soil and groundwater laboratory results from MW-6 and MW-13, it is helping to retard downward migration of hydrocarbons.

Shallow wells MW-10 and MW-11 did not contain water, most likely due to the late summer season; however, analysis of soil samples from the potential shallow water-bearing zone in these downgradient wells did not indicate the presence of petroleum hydrocarbons. The lateral extent of dissolved-phase hydrocarbons in the shallow water-bearing zone is delineated to the northwest, northeast, and southwest (upgradient and crossgradient) by borings and wells MW-9, MW-8, and MW-7. Stantec recommends that wells MW-10 and MW-11 be inspected for the presence of groundwater, and developed as necessary, prior to the first quarter 2009 semiannual monitoring and sampling event, to allow collection of a time-synchronous round of groundwater data from the shallow water-bearing zone, including downgradient wells, during that quarter. If concentrations in MW-6 remain at current levels, remediation in this area will be warranted.

The lateral extent of dissolved-phase hydrocarbons in deeper groundwater is delineated to relatively low concentrations to the southwest (crossgradient) by SP-7 and MW-7, and to the east and southeast (downgradient) by wells MW-4, MW-12B, and MW-15B. Concentrations of dissolved phase petroleum hydrocarbons in offsite soil boring SP-8 were not confirmed by the results from well MW-12B, which were more than two orders of magnitude lower. These concentrations should be verified by semiannual sampling and analysis.

Although PCE, TCE, and cis-1,2-DCE have been detected in groundwater, the site does not appear to be the source of these compounds. Stantec recommends that analysis for these compounds be discontinued.

Based on the distances and locations of the potential receptors upgradient and crossgradient of the site, Stantec does not recommend further investigation of these receptors. Based on the soil laboratory results from MW-10 and MW-11, Stantec does not recommend further investigation of the basements downgradient (east and southeast) of the site at this time. If groundwater from MW-10 and MW-11 is analyzed and found to contain petroleum

hydrocarbons, then Stantec will recommend further investigation and possibly vapor or groundwater sampling to confirm that hydrocarbons are not impacting the basements.

6.0 Limitations

This report was prepared in accordance with the scope of work outlined in Stantec's contract and with generally accepted professional environmental consulting practices existing at the time this report was prepared and applicable to the location of the site. It was prepared for the exclusive use of ConocoPhillips, for the express purpose stated above. Any re-use of this report for a different purpose or by others not identified above shall be at the user's sole risk without liability to Stantec. To the extent that this report is based on information provided to Stantec by third parties, Stantec may have made efforts to verify this third party information, but Stantec cannot guarantee the completeness or accuracy of this information. The opinions expressed and data collected are based on the conditions of the site existing at the time of the field investigation. No other warranties, expressed or implied are made by Stantec.

Notes:

<	Denotes less than Laboratory PQL	DIPE	Di-isopropyl ether	MTBE	Methyl tertiary butyl ether	TOG	Total oil and grease
bgs	below ground surface	EDB	Ethylene dibromide	PQL	Practical Quantitaion Limit	TPHd	Total petroleum hydrocarbons as diesel
mg/kg	milligrams per kilogram	EPA	Environmental Protection Agency	TAME	Tert-amyl methyl ether	TPPH	Total purgeable petroleum hydrocarbons
1,2-DCA	1,2-Dichloroethane	ETBE	Ethyl tertiary butyl ether	TBA	Tertiary butyl alcohol		

1 Analyzed by EPA Method 3550/8015M
2 Analyzed by Standard Method 5520 E&F (Gravimetric)
3 Analyzed by EPA Method 5030/8015M between 8/1992 and 3/1995; by EPA Method 8260 between 12/2006 and the present.
4 Analyzed by EPA Method 8020 between 8/1992 and 3/1995; by EPA Method 8260 between 12/2006 and the present.
5 Analyzed by EPA Method 8260B
6 Analyzed by EPA Method 6000/7000

a Sample was analyzed for Halogenated Volatile Organic Hydrocarbons (HVOCs) by EPA Method 8010. Tetrachloroethene was detected at 0.0064 mg/kg. The additional HVOCs were reported as non-detect.
b Chromatograph pattern: Diesel and non-diesel mixture (<C14; >C22).
c Sample was analyzed for HVOCs by EPA Method 8010. All HVOCs were reported as non-detect.
d The Continuing Calibration Verification (CCV) recovery was not within established control limits.
e The PQL'S and MDL's was raised due to sample dilution.
f Estimated Value (CLP Flags)

6 Analyzed by California LUFT Manual, 12/87.

a Chromatograph pattern: diesel and non-diesel mixture (<C16; >C22).
b The presence of MTBE was potentially identified at reportable levels.
c The presence of MTBE was identified at a level equal to or above the taste and odor threshold of 40 µg/L.
d The hydrocarbons detected appeared to be gasoline and a non-gasoline mixture.
e Chromatograph pattern: unidentified hydrocarbons C6-C12
f Chromatograph pattern: weathered gasoline: C6-C12
g Chromatograph pattern: discrete peaks C8-C12
h Chromatograph pattern: discrete peaks
i Sample was additionaly run under EPA Method 8260B. MTBE was detected at 1,140 µg/L. All other analytes were non-detect.
j Single analyte peak(s) were present in the requested fuel quantitation range. Fuel hydrocarbon pattern was not present.
k The concentration reported reflect(s) individual or discrete unidentified peaks not matching a typical fuel pattern.
l Chromatogram not typical of gasoline.
m TPPH was positive due to tetrachloroethane present in the sample.
n PQL's and MDL's were raised due to sample dilution.
o Tetrachloroethene was subtracted from the gasoline range TPH.
p The Continuing Calibration Verification (CCV) recovery was not within established control limits.
q The BC laboratory report indicated that reported concentration of 200 µg/L TPPH was due only to the presence of 90 µg/L PCE, 15 µg/L trichloroethane, and 9.8 µg/L cis-1,2-DCA; therefore, SECOR has represented the results for TPPH in this laboratory report as non-detect.
r Sample also analyzed for trans-1,2-dichloroethene; non detect above 0.5 µg/L.
s PCE, TCE, and 1,2-DCE were subtracted from the gasoline range TPPH.
t Samples hold time was exceeded.
u Depth to GW was collected on 9/28/2007 and sample was collected on 8/30/2007
v Not enough sample to re-run for PCE.

1 TOC elevations were surveyed by MidCoast Engineers to the NAVD 88 Datum by GPS observations on 8/18/2008.
2 Depth was recorded from below the TOC for monitoring wells.
3 Analyzed by EPA Method 8260.

a PQL's were raised due to sample dilution.
b Chromatogram not typical of gasoline.
c Sample also analyzed for trans-1,2-dichloroethene; non detect above 0.50 µg/L.

SUBJECT: CONOCOPHILLIPS 76 STATION #6390 AT 402 SOUTH DELAWARE STREET, SAN MATEO, CALIFORNIA

Dear Ms. Lathrop:

Thank you for the February 28, 2007, assessment report and the unsolicited July 9, 2007, work plan prepared by SECOR International Incorporated. The following comments are based on San Mateo County Groundwater Protection Program (GPP) staff review of this work plan and the project file.

Assessment Report

The site history section is very informative. However, our records indicate the capacity of the waste oil UST removed in 1992 was 550 gallons, the sample from MW-4 at 15 feet below grade (fbg) contained 600 mg/kg TPH-gas, and California Department of Water Resources (DWR) well records were reviewed in June 1996 for the presence of water supply wells within 0.25 mile of the subject site. Please consider this information in preparing the background section of future reports.

The tables are very useful. However, Table 1 lists an incorrect tetrachloroethene (PCE) concentration for Footnote A (should be 0.0064 mg/kg) and the sample name listed for A2 and B2 does not match what is shown on report figures. Table 2 identifies Boring SP4 as SP-3 and does not indicate the proper sample name of SP1 and SP2 (no dash was used by the sampling consultant). In addition, Tables 1 and 4 incorrectly identify Borings SP-6 through SP-8 as SB-6 through SB-8. Please ensure future tables listing this information address these observations.

GPP staff could not establish the groundwater sampling depth for Borings SP-5 through SP-8. Sections 3.8 of the report and the field procedures in Appendix B indicate a hydropunch sampler was emplaced across to the "desired" sampling depth. However, this sampling depth was not identified. Sections 3.4 of the report and the boring logs in Appendix C do not indicate the depth interval occupied by the hydropunch (the logs indicate the total depth of Borings SP-5 through SP-8 was between 28 and 34 fbg and groundwater equilibrated in these borings at approximately 15 fbg). Hence, GPP staff cannot establish whether the groundwater samples from these borings were collected from a discrete interval (which was not identified) or represent a mixture of groundwater between approximately 15 fbg and 34 fbg. Therefore, please upload to the State GeoTracker database by **March 25, 2008**, a letter clarifying the groundwater sample collection depth in Borings SP-5 through SP-8.

RECEIVED
FEB 4 2008
By

The depth to the top of the screened interval in MW-7 and MW-8 is less than the depth to groundwater. Although this construction inhibits assessment of first groundwater, it does not appear first groundwater is significantly impacted in these areas based on the laboratory results from the analysis of soil samples collected from the well boring.

The laboratory results from the analysis of subsurface vapor samples suggests hydrocarbon-affected soil and groundwater do not pose a significant indoor air inhalation risk to site occupants. However, the report indicates these samples were collected within 3 days of the area receiving 0.16 inch of precipitation. GPP staff will accept these results because this precipitation amount was below the threshold listed in the soil gas advisory document prepared by the Department of Toxic Substances Control and Los Angeles RWQCB, as argued by SECOR. However, these agencies are currently revising this document which may affect the use of these results.

The historical laboratory results from the analysis of soil samples indicate hydrocarbon-affected soil in the unsaturated zone is not a concern at this site. A comparison of the laboratory results from the analysis of soil samples collected from MW-2 and MW-6 also indicates potential degradation of residual hydrocarbons in saturated zone soils adjacent to the northeast side of the fuel UST cavity.

The report concludes with recommendations to further assess the extent of dissolved-phase hydrocarbons. Our comments on these recommendations are discussed in the following section because they were incorporated into the work plan.

Work Plan

The work plan proposes to remove the subslab vapor sampling probe, destroy the vapor sampling wells, and install seven groundwater monitoring wells to assess the lateral and vertical extent of dissolved-phase fuel hydrocarbons and PCE. GPP staff approve the destruction of the subslab probe and vapor wells and the installation of proposed wells MW-10, MW-11, and MW-13B with the following conditions:

- Evaluate whether the vapor sampling points should be destroyed at this time because they may be needed for future vapor sampling (e.g. change to DTSC soil gas advisory) or remedial testing/monitoring (the Cleanup Fund may not reimburse the cost to reinstall these points if the existing points can be used for other environmental purposes);

- Ensure wells MW-10 and MW-11 are screened across the water table to a sufficient depth to provide useful assessment data without cross-connecting permeable strata to a detrimental degree (constructing these wells like MW-9 may not yield useful data);

- Additionally analyze soil samples collected >20 fbg from MW-13B to assess the vertical extent of the smear zone not assessed by the sampling of MW-6;

- Evaluate using the results of the DWR water supply research performed in June 1996 for the proposed receptor survey;

- Additionally identify the type and location of identified receptors on the figure(s) prepared for the sensitive receptor survey; and

- Submit to the State GeoTracker database by **September 10, 2008**, all electronic files required by California Code of Regulations Title 23, Division 3, Chapter 30, including a report detailing and justifying the methods, findings, conclusions, and recommendations of the investigation

The portion of the work plan proposing to research the source of the PCE and install Monitoring Wells MW-12B and MW-14B through MW-16B does not appear justified. Our reasons for this conclusion are provided in the following paragraphs.

Researching the source of the PCE in groundwater does not appear necessary because it does not appear the subject site was the source of the PCE. This conclusion is based on the PCE concentration in soil sample WO1 (below Environmental Screening Level) and the distribution of PCE in groundwater (does not agree with the distribution of fuel hydrocarbons).

It does not appear proposed monitoring wells MW-12B and MW-14B are necessary. MW-12B does not appear warranted based on the laboratory results from the analysis of groundwater samples from deeper screened MW-1 when depth to groundwater was below the silty gravel layer logged in MW-9. MW-14B does not appear necessary based on the laboratory results from the analysis of soil and groundwater samples from MW-8, length of screened interval in MW-8, and location of MW-8 relative to the source area (fuel UST cavity) and pattern of contamination. However, GPP staff could support collecting depth discrete groundwater samples near SP4 because SP4 was only drilled to 13 fbg (less than the depth of soil impacts identified in the saturated zone of SP-5 and MW-4 and MW-5).

GPP staff cannot support the installation of proposed wells MW-15B and MW-16B until the depth of the groundwater impact near Borings GP-5 through GP-8 is identified and the postulated uniqueness of the shallow and slightly deeper water bearing zones has been demonstrated (i.e. establishing whether the 1.5-foot-thick silt/clay layer logged below 15 fbg in SP-5, SP-6, and SP-8 effectively separates communication between the sands and gravels logged on each side of this stratum). Please discuss in the letter due by March 25, 2008, whether screening a well across this silt/clay layer will negatively impact the quality of groundwater monitoring data or the aquifer, and either support the proposed work or justify alternatives. Please note, if the depth of hydrocarbon-affected groundwater in SP-8 can be identified and is

significantly below the water table, then GPP staff could support installing up to two monitoring wells near SP-8 (one to assess the depth of identified impact and the other to assess groundwater near the water table [appears affected based on laboratory results of soil samples from 19.5 fbg]). However, if the depth of groundwater impact in GP-5 through GP-8 cannot be established, then GPP staff could only support installing one monitoring well near SP-8 to assess groundwater in the uppermost saturated zone and the drilling of borings near SP-8 and MW-11 to determine the vertical extent of dissolved-phase hydrocarbons below the water table (an objective of the previous work).

Please note, ConocoPhillips can implement the proposed work not considered necessary by GPP staff because it does not appear to pose a risk to public safety. However, GPP staff cannot recommend the UST Cleanup Fund reimburse the cost of this work without justification.

GeoTracker Compliance

GPP staff had to deny GeoMap Confirmation 4861744761 for the reasons discussed in the denial. Please upload a correct version of this file within **45 days**. It appears all other required GeoTracker files have been uploaded.

Please call me at (650) 363-4972 if you have any questions.

Sincerely,

Deno G. Milano, P.G.

SUBJECT: CONOCOPHILLIPS 76 STATION #6390 AT 402 SOUTH DELAWARE STREET, SAN MATEO, CALIFORNIA

Dear Ms. Lathrop:

Thank you for the March 25, 2008, revised work plan prepared by SECOR International Incorporated (Stantec). The following comments are based on San Mateo County Groundwater Protection Program (GPP) staff review of this work plan and the project file.

Revised Work Plan

The revised work plan modifies the work plan dated July 9, 2007, which was conditionally approved in our letter dated January 30, 2008. ConocoPhillips may proceed with the proposed work incorporating the applicable conditions of approval in our letter dated January 30, 2008. However, GPP staff do not consider proposed MW-12B necessary because very low levels of hydrocarbons were reported in groundwater samples collected from former MW-1 when depth to groundwater was below the silty gravel layer logged in MW-9 and proposed MW-14B though MW-16B should be sufficient to evaluate vertical component to groundwater flow and groundwater gradient in the deeper portion of the saturated zone. Therefore, we cannot recommend the UST Cleanup Fund reimburse the cost of MW-12B without justification.

MW-16B is proposed approximately 40 feet northeast of Boring SP-8. Please consider installing this well adjacent to SP-8 to confirm the unexpected TPH-gas concentration reported in the groundwater sample collected from SP-8 and to monitor plume stability if this concentration is confirmed. Please also note, using proposed MW-13B for groundwater gradient calculation may be problematic if groundwater is leaking from permeable backfill in the UST cavity.

Groundwater Sample Depth in Borings SP-5 through SP-8

Stantec observed first encountered groundwater in Borings SP-5 through SP-8 between 20 and 32 feet below grade (fbg). GPP staff agree the first readily available groundwater was encountered in the coarser-grained units corresponding to these observations. However, this does not preclude the presence and movement of water (and potentially contaminants) within the finer-grained confining units, especially considering the time-frame of this release. Groundwater flow within the confining units is supported by the following observations: 1) the presence of groundwater in MW-9 (15-foot-deep well); 2) the groundwater elevation in MW-9 aligns with

the groundwater elevation contours calculated using the other wells (refer to groundwater gradient map in First Quarter 2008 monitoring report); and 3) hydrocarbon-affected soil was reported at 15 fbg in MW-4 located approximately 90 feet from the product storage and dispensing facilities (i.e. hydrocarbons likely from impacted groundwater). Hence, the groundwater grab samples collected from SB-5 through SB-8 likely reflect the chemistry of the more permeable strata below the potentiometric surface because these units can transmit water more freely to the borehole. Nevertheless, GPP staff will not require ConocoPhillips to re-drill borings near SP-5 through SP-8 for the collection of shallower groundwater samples because the location of proposed MW-10 is near SP-5, MW-9 assesses shallow groundwater near SP-6, and the laboratory results from the analysis of soil samples collected from SP-5 through SP-8 between 7 and 15 fbg were below acceptable reporting limits.

Please keep in mind the objective of proposed MW-10 and MW-11 is to assess first groundwater. The gauging data from MW-9 indicate depth to first groundwater is <20 fbg and a comparison of the dissolved-phase hydrocarbon concentrations from MW-2 and MW-6 indicates first groundwater near the site is impacted to a greater extent than deeper groundwater. Confined conditions do not preclude the presence of groundwater in the aquitard.

Please call me at (650) 372-6292 if you have any questions.

Sincerely,

Deno G. Milano, P.G.

 2008 SUBSURFACE DRILLING PERMIT APPLICATION

REQUIREMENTS:

An accurate & correct map of existing and proposed well/boring locations **must** be included with the permit application. The well/boring location map **must** include the following.

1. North arrow, existing & historic site features, wells, approximate property lines and any other pertinent existing & historic features and information.
2. Proposed well/boring locations to scale.

A work plan describing the drilling and construction/destruction methodology, at a minimum, is **required** by County Staff. Upon review of information on this application and the submitted work plan, and subject to approval noted below, a permit will be issued allowing well/boring owner, driller, and responsible professional (consultant) to perform the specified work. The permit is subject to both General and Special Conditions stated below. A copy of the approved Subsurface Drilling Permit **must** be available on site while work related to the permit is being performed. Drilling date and time **must** be scheduled with County staff at least three (3) working days in advance of field work. Drilling may begin at the notified date and time whether County staff is present or not.

GENERAL CONDITIONS:

A. Well and boring construction and destruction under this permit is subject to the Standards for the Construction of Wells in San Mateo County, County Groundwater Protection Program (GPP) Guidelines, Policies & Procedures, the State Water Well Standards, and any instructions by a Health Department representative.

B. Well/Boring Owner, Driller, and Responsible Professional assume responsibility for all activities and uses under the permit, including compliance with Workmen's Compensation Laws, and indemnify, defend and save the County of San Mateo, its' officers, agents and employees, free and harmless from any and all expense, cost, or liability in connection with or resulting from work or stopped-work associated with the permit, including, but not limited to, property damage, personal injury, wrongful death, and loss of income.

C. All borings **must** be properly destroyed (grouted/sealed) within 24 hours of drilling unless special conditions are approved in writing as part of this permit.

D. Analytical results of all soil and groundwater samples collected during the execution of drilling under this permit **must** be submitted to County GPP staff by the Responsible Professional within 60 days of sample collection. If contamination is discovered during drilling, verbal notification to County GPP by the Responsible Professional is **required** within 72 hours of discovery. Proper storage, labeling & disposal of investigation-derived wastes are the responsibility of the consultant unless stated otherwise contractually.

E. In addition to the County copy of the State DWR Form 188, boring logs and well construction details for all borings/wells, signed by a Responsible Professional, **must** be submitted to County GPP by the Responsible Professional within 60 days of drilling/construction/destruction. As-built locations/dimensions **must** be finalized in subsequent report of findings submitted to County GPP by the Responsible Professional within 60 days of drilling/construction/destruction.

F. Permit is valid only for the purpose specified herein. No change in construction procedure, as described on this permit application, in the associated workplan, or in the special conditions below, will be allowed except upon written permission from the County.

G. Permit is valid for one mobilization only and is automatically canceled if not exercised, or if an extension is not applied for and granted by County GPP, within 90 days of the original permit issuance date. Failure to notify staff of cancellation or delay in start time, in a timely manner, may result in additional hourly charges to be invoiced to the consultant by GPP Staff.

H. Wells installed under this permit may not be used for domestic, municipal, commercial, or irrigation water supply.

I. All work plans and reports related to work performed under County oversight **must** conform to County GPP guidelines, Regional Water Quality Control Board guidelines, and State Water Well Standards.

J. Top-of-casing elevation of all wells **must** be surveyed to the nearest 0.01-foot relative to Mean Sea Level (NAVD88) and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate.

K. Latitude and longitude of all wells **must** be surveyed with sub-meter accuracy relative to NAD83 and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate.

L. Violation of any requirement or general or special permit condition may result in an order by GPP staff to cease work under this permit, correct the violation, and potentially re-permit the work as a new mobilization.

2008 SUBSURFACE DRILLING PERMIT APPLICATION

REQUIREMENTS:

An accurate & correct map of existing and proposed well/boring locations **must** be included with the permit application. The well/boring location map **must** include the following.

1. North arrow, existing & historic site features, wells, approximate property lines and any other pertinent existing & historic features and information.
2. Proposed well/boring locations to scale.

A work plan describing the drilling and construction/destruction methodology, at a minimum, is **required** by County Staff. Upon review of information on this application and the submitted work plan, and subject to approval noted below, a permit will be issued allowing well/boring owner, driller, and responsible professional (consultant) to perform the specified work. The permit is subject to both General and Special Conditions stated below. A copy of the approved Subsurface Drilling Permit **must** be available on site while work related to the permit is being performed. Drilling date and time **must** be scheduled with County staff at least three (3) working days in advance of field work. Drilling may begin at the notified date and time whether County staff is present or not.

GENERAL CONDITIONS:

A. Well and boring construction and destruction under this permit is subject to the Standards for the Construction of Wells in San Mateo County, County Groundwater Protection Program (GPP) Guidelines, Policies & Procedures, the State Water Well Standards, and any instructions by a Health Department representative.

B. Well/Boring Owner, Driller, and Responsible Professional assume responsibility for all activities and uses under the permit, including compliance with Workmen's Compensation Laws, and indemnify, defend and save the County of San Mateo, its' officers, agents and employees, free and harmless from any and all expense, cost, or liability in connection with or resulting from work or stopped-work associated with the permit, including, but not limited to, property damage, personal injury, wrongful death, and loss of income.

C. All borings **must** be properly destroyed (grouted/sealed) within 24 hours of drilling unless special conditions are approved in writing as part of this permit.

D. Analytical results of all soil and groundwater samples collected during the execution of drilling under this permit **must** be submitted to County GPP staff by the Responsible Professional within 60 days of sample collection. If contamination is discovered during drilling, verbal notification to County GPP by the Responsible Professional is **required** within 72 hours of discovery. Proper storage, labeling & disposal of investigation-derived wastes are the responsibility of the consultant unless stated otherwise contractually.

E. In addition to the County copy of the State DWR Form 188, boring logs and well construction details for all borings/wells, signed by a Responsible Professional, **must** be submitted to County GPP by the Responsible Professional within 60 days of drilling/construction/destruction. As-built locations/dimensions **must** be finalized in subsequent report of findings submitted to County GPP by the Responsible Professional within 60 days of drilling/construction/destruction.

F. Permit is valid only for the purpose specified herein. No change in construction procedure, as described on this permit application, in the associated workplan, or in the special conditions below, will be allowed except upon written permission from the County.

G. Permit is valid for one mobilization only and is automatically canceled if not exercised, or if an extension is not applied for and granted by County GPP, within 90 days of the original permit issuance date. Failure to notify staff of cancellation or delay in start time, in a timely manner, may result in additional hourly charges to be invoiced to the consultant by GPP Staff.

H. Wells installed under this permit may not be used for domestic, municipal, commercial, or irrigation water supply.

I. All work plans and reports related to work performed under County oversight **must** conform to County GPP guidelines, Regional Water Quality Control Board guidelines, and State Water Well Standards.

J. Top-of-casing elevation of all wells **must** be surveyed to the nearest 0.01-foot relative to Mean Sea Level (NAVD88) and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate.

K. Latitude and longitude of all wells **must** be surveyed with sub-meter accuracy relative to NAD83 and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate.

L. Violation of any requirement or general or special permit condition may result in an order by GPP staff to cease work under this permit, correct the violation, and potentially re-permit the work as a new mobilization.

APPENDIX B
Field and Laboratory Procedures

FIELD AND LABORATORY PROCEDURES

Utility Locating

Prior to drilling, boring locations are marked with white paint or other discernible marking and cleared for underground utilities through Underground Service Alert (USA). In addition, the first five feet (or more in instances where utilities are suspected in close proximity) of each borehole are air-knifed, or carefully advanced with a hand auger if shallow soil samples are necessary, to help evaluate the borehole location for underground structures or utilities.

Hollow Stem Auger Drilling/Monitoring Well Installation

Borehole Advancement

Pre-cleaned hollow stem augers (typically 8 to 10 inches in diameter) are advanced using a drill rig for the purpose of collecting samples and evaluating subsurface conditions. In conditions where a separate saturated zones are encountered, 18 inch diameter HSA flights are advanced to a depth within the aquitard that separates the two saturated zones, and a 10 inch diameter steel outer conductor casing are installed in the boring approximately 1 to 2 feet into the underlying aquitard and grouted in place, in order to install a groundwater monitoring well screened in the lower saturated zone. After allowing the cement to cure for a period of at least 72 hours, 8 inch diameter HSA flights are advanced through the cement plug at the bottom of the steel casing to the final depth of the boring. Upon completion of drilling and sampling, if no well is to be constructed, the augers are retracted, and the borehole is filled with neat cement grout, mixed at a ratio of 6 gallons of water per 94 pounds of Portland cement, through a tremmie pipe, and pumped to displace standing water in the borehole. In areas where the borehole penetrates asphalt or concrete, the borehole is capped with an equivalent thickness of asphalt or concrete patch to match finish grade.

During the drilling process, a physical description of the encountered soil characteristics (i.e. moisture content, consistency or density, odor, color, and plasticity), drilling difficulty, and soil type as a function of depth are described on boring logs. The soil cuttings are classified in accordance with the USCS.

Split-Spoon Sampling

The precleaned split spoon sampler lined with three 6-inch long brass or stainless steel tubes is driven 18 inches into the underlying soils at the desired sample depth interval. The sampler is driven by repeatedly dropping a 140-pound hammer a free fall distance of 30 inches. The number of blows (blow count) to advance the sampler for each six-inch drive length is recorded on the field logs. Once the sampler is driven the 18-inch drive length or the sampler has met refusal (typically 50 blows per six inches), the sampler is retrieved. Alternatively, with a limited access rig, soil samples are obtained by driving the sample using a pneumatic hammer.

Of the three sample tubes, the bottom sample is generally selected for laboratory analysis. The sample is carefully packaged for chemical analysis by capping each end of the sample with a Teflon sheet followed by a tight-fitting plastic cap, and sealing the cap with non-VOC, self-adhering silicon tape. A label is affixed to the sample indicating the sample identification

number, borehole number, sampling depth, sample collection date, and job number. The sample is then annotated on a chain-of-custody form and placed in an ice-filled cooler for transport to the laboratory.

The remaining soil samples are used for soil classification and field evaluation of headspace volatile organic vapors, where applicable, using a photo ionization or flame ionization detector calibrated to a calibration gas (typically isobutylene or hexane). VOC vapor concentrations are recorded on the boring logs.

Groundwater Monitoring Well Installation and Development

Groundwater monitoring wells are constructed by inserting or tremmieing well materials through the annulus of the hollow stem auger. The groundwater monitoring wells are constructed with a screen interval determined from the encountered soil stratigraphy, to maintain a proper seal at the surface (minimum three feet), screen the top of the water-bearing zone, and avoid penetrating aquitards. Groundwater wells are installed in accordance with the conditions of the well construction permit issued by the regulatory agency exercising jurisdiction over the project site.

The well screen generally consists of schedule 40 polyvinyl chloride (PVC) casing with 0.01 to 0.02 factory slots. As a general rule, 0.01 inch slots are used in fine-grained silts and clays and 0.02 inch slots are used in coarse-grained materials. The screen is then filter packed with #2/12 or #3 sand, or equivalent, for the 0.01 and 0.02 inch slots, respectively.

Once the borehole has been drilled to the desired depth, bentonite chips (to backfill an aquitard) or six inches of filter sand are tremmied to the bottom of the boring. The well screen and blank well casing are then inserted through the annulus of the hollow stem augers. The well screen is sand packed by tremmieing the appropriate filter sand through the annulus between the casing and augers while slowly retracting the augers. During this operation, the depth of the sand pack in the auger is continuously sounded so that the sand remains in the auger annulus during auger retraction to avoid short-circuiting the well. The sand pack is tremmied to approximately two feet above the screen, at which time pre-development surging is performed to consolidate the sand pack. Additional sand is added as necessary to help ensure that the sand pack extends a minimum of two feet above top of screen. Following construction of the sand pack, a two foot thick bentonite seal is tremmied over the sand and hydrated in place. The remainder of the borehole is backfilled with Portland neat cement grout (or the equivalent), mixed at ratio of 6 gallons of water per 94 pounds of neat cement. The well head is then capped with a locking cap and secured with a lock to protect the well from surface water intrusion and vandalism.

The well head is further protected from damage with traffic a rated well box in paved areas or locking steel riser in undeveloped areas. The protective boxes or risers are set in concrete. The details of well construction are recorded on well construction logs.

Following well construction, the wells are developed in accordance with agency protocols by intermittently surging and bailing the wells. Development is deemed to be sufficient once pH, conductivity and temperature stabilize to within approximately ≤ 0.1, ≤ 3%, and ≤ 10%, respectively, or when ten casing volumes have been removed.

Groundwater Monitoring Well Sampling

Depth to Groundwater/SPH Thickness Measurements

Prior to the beginning of purging and sampling the wells, the depth to groundwater and thickness of SPH, if present, within each well casing are measured to the nearest 0.01 foot using either an electronic water level indicator or an electronic oil-water interface probe. This is done in within as narrow a time frame as possible, and before the first well is purged. Measurements are taken from a point of known elevation on the top of each well casing as determined in accordance with surveys by licensed land surveyors.

Groundwater Monitoring Well Purging

Groundwater wells are purged using low-flow protocol at a flow rate of less than 1 liter per minute using a bladder pump. The purge intake is placed opposite the portion of the saturated zone expected to contain the greatest hydrocarbon impact, and the depth of the purge intake is recorded during and after purging. The water level in each well is monitored, and care is taken that the well is not dewatered. The conductivity, temperature, and pH of the delivered effluent are monitored and recorded using a flow-through cell during purge operations. Purge operations are determined to be sufficient once three successive measurements of pH, conductivity, and temperature of the purged water at 3 to 5 minute intervals following the evacuation of one system or line volume vary by ≤ 0.1, ≤ 3%, and ≤ 10%, respectively. System or line volumes, actual purge volumes, and the purging equipment used are recorded on the field data sheets.

Groundwater Sample Acquisition, Handling, and Analysis

Following purging operations, groundwater samples are collected from each of the wells, using a low-flow bladder pump. The groundwater sample is discharged from the pump tubing to the sample container before the water passes through the flow-through cell. The sampling equipment is recorded on the field data sheets.

Collected water samples are discharged directly into laboratory provided, pre-cleaned, and chemically preserved sample containers for the analyses requested. Preservatives are used in the samples if appropriate for the analyses, i.e. hydrochloric acid (HCl) for TPPH, BTEX, and fuel oxygenates by EPA Method 8260B.

Labels documenting sample number, well identification, collection date and time, type of sample and type of preservative (if applicable) are affixed to each sample. The samples are then placed into an ice-filled cooler for delivery under chain of custody to a certified laboratory. The type of preservative used is documented on the chain of custody form.

To help assure the quality of the collected samples and to evaluate the potential for cross contamination during transport to the laboratory, a distilled-water trip blank accompanies the samples in the cooler. The trip blank is analyzed for the presence of volatile organic compounds of concern. For petroleum hydrocarbons, the trip blank is typically analyzed for TPHg, BTEX, and fuel oxygenates by EPA Method 8260.

Organic Vapor Procedures

Soil samples are collected for analysis in the field for ionizable organic compounds using a PID with a 10.2 eV lamp. The test procedure involves measuring approximately 30 grams from an undisturbed soil sample, placing this sub-sample in a Ziploc™-type bag or in a clean glass jar, and sealing the jar with aluminum foil secured under a ring-type threaded lid. The container is warmed for approximately 20 minutes (in the sun); then the head-space within the container is tested for total organic vapor, measured in parts per million as benzene (ppm; volume/volume). The instrument is calibrated prior to drilling. The results of the field-testing are noted on the boring logs. PID readings are useful for indicating relative levels of contamination, but cannot be used to evaluate petroleum hydrocarbon levels with the confidence of laboratory analyses.

Equipment Decontamination

Equipment that could potentially contact subsurface media and compromise the integrity of the samples is carefully decontaminated prior to drilling and sampling. Drill augers and other large pieces of equipment are decontaminated using high pressure hot water spray. Samplers, groundwater pumps, liners and other equipment are decontaminated in an Alconox scrub solution and double rinsed in clean tap water rinse followed by a final distilled water rinse.

The rinsate and other wastewater are contained in 55-gallon DOT-approved drums, labeled (to identify the contents, generation date and project) and stored on-site pending waste profiling and disposal.

Soil Cuttings and Rinsate/Purge Water

Soil cuttings and rinsate/purge water generated during drilling and sampling are stored on-site in DOT-approved 55-gallon steel drums pending characterization. A label is affixed to the drums indicating the contents of the drum, suspected contaminants, date of generation, and the boring number from which the waste is generated. The drums are removed from the site by a licensed waste disposal contractor to an appropriate facility for treatment/recycling.

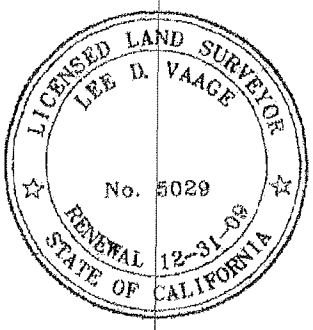
Re: **CONOCOPHILLIPS, 76 Service Station No. 6390, 402 South Delaware Street, San Mateo, California;** Stantec Job Number 77CP.01574.43, MCE Job No. 08119

Dear Ms. Sanchez,

As you requested, on August 18 we surveyed six new monitoring wells and three existing wells located at the referenced site. Our findings are shown on the attached sheets, expressed in State Plane Coordinates and Latitude/Longitude.

For the monitoring wells, a notch was cut in the north rim of the PVC casing (TOC) and a cross chiseled in the north rim of the standard box (TOB).



Measurements were obtained from conventional survey techniques in combination with GPS techniques (Code CGPS), using GPS Stations No. 1004 and 1008, as shown on "Record of Survey for City of San Mateo of GPS Control Network", filed in Volume 14 of Licensed Land Surveyor Maps, Pages 83-86, San Mateo County Records. Latitude and Longitude as shown were determined from the California Coordinate System, Zone 3, NAD 83 Datum. The accuracy range of the reported information is +/- 1cm. GPS equipment is the Trimble 5700/5800 system (Code T57). However, at your direction, we rotated and translated our files to conform to the data from a previous survey by Morrow Surveying, supplied by you. The reported coordinate and bearing base was established using data for MW-7 TOC and MW-4 TOC.

The benchmark used for this survey is the TOC of MW-7 as described above and reported by Morrow Surveying. Elevation = 21.74 feet, reported to be NAVD 88 datum.

Please let me know if you have questions or need additional information.

Yours truly,

Lee D. Vaage

APPENDIX F
Certified Laboratory Analytical Results, Stantec Laboratory Validation Forms, and Chain-of-Custody Documentation

Is Data Valid? (circle)
YES
NO

Preservation Temperature
(If Known)

8.3-8.4 °C

Stantec Lab Validation Sheet

Project/Client: 76 Service Station No. 6390 / ConocoPhillips operate
Project #: 77CP.01266.47.1100
Date of Validation: 8/15/08 **Date of Analysis:** 8-8/8-12-08 **Sample Date:** 8/6/08
Completed By: Laura Sanchez **Signature:** 
Analytical Lab Used and Report # (if any): BC Labs 0810386

Circle/Highlight
Yes or No

1.	**Was the analysis the one requested?**	**Yes** / **No**
2.	**Do the sample number(s) on the chain-of-custody (COC) match the one(s) that appear on the laboratory data sheet?**	**Yes** / **No**
3.	**Were samples prepared (extracted, filtered, etc.) within EPA holding times?**	**Yes** / **No**
4.	**Once prepared/extracted, were the samples analyzed within the EPA holding times?**	**Yes** / **No**
5.	**Were Laboratory blanks performed, if so, were they below non-detect?**	**Yes** / **No**
6.	**Are the units correct? (i.e., soil samples in mg/kg or ug/g, water samples mg/L, ug/L, and air samples in volume mg/m^3,etc.)**	**Yes** / **No**
7.	**Were appropriate Matrix Spike (MS) and Matrix Spike Duplicate (MSD) samples included in the laboratory batch sample?**	**Yes** / **No**
8.	**In lieu of MS/ MSD, were surrogate spike (SS) or surrogate spike duplicate (SSD) samples included in the laboratory batch samples?**	**Yes** / **No**
9.	**Were MS/ MSD (or SS/SSD) within the acceptable range of % recovery (i.e., approx 80-120% depending on analyte)?**	**Yes** / **No**
10.	**Were MS/MSD (or SS/SSD) values used to calculate Relative Percent Difference (RPD)?**	**Yes** / **No**
11.	**Were Relative Percent Difference values within the acceptable range (i.e. ± 25%)?**	**Yes** / **No**

If any answer is no, explain why and what corrective action was taken:

BC Laboratories, Inc.

Notes And Definitions

MDL	Method Detection Limit
ND	Analyte Not Detected at or above the reporting limit
PQL	Practical Quantitation Limit
RPD	Relative Percent Difference
A01	PQL's and MDL's are raised due to sample dilution.

Is Data Valid? (circle)
YES
NO

Preservation Temperature
(If Known)

4.3-1.8 °C

Stantec Lab Validation Sheet

Project/Client: 76 Service Station No. 6390 / ConocoPhillips operate
Project #: 77CP.01266.47.1100
Date of Validation: 8/20/08 **Date of Analysis:** 8-14/8-15-08 **Sample Date:** 8-8/8-11-08
Completed By: Laura Sanchez **Signature:** Laura Sanchez
Analytical Lab Used and Report # (if any): BC Labs 0810624

Circle/Highlight
Yes or No

1.	Was the analysis the one requested?	Yes No
2.	Do the sample number(s) on the chain-of-custody (COC) match the one(s) that appear on the laboratory data sheet?	Yes No
3.	Were samples prepared (extracted, filtered, etc.) within EPA holding times?	Yes No
4.	Once prepared/extracted, were the samples analyzed within the EPA holding times?	Yes No
5.	Were Laboratory blanks performed, if so, were they below non-detect?	Yes No
6.	Are the units correct? (i.e., soil samples in mg/kg or ug/g, water samples mg/L, ug/L, and air samples in volume mg/m^3,etc.)	Yes No
7.	Were appropriate Matrix Spike (MS) and Matrix Spike Duplicate (MSD) samples included in the laboratory batch sample?	Yes No
8.	In lieu of MS/ MSD, were surrogate spike (SS) or surrogate spike duplicate (SSD) samples included in the laboratory batch samples?	Yes No
9.	Were MS/ MSD (or SS/SSD) within the acceptable range of % recovery (i.e., approx 80-120% depending on analyte)?	Yes No
10.	Were MS/MSD (or SS/SSD) values used to calculate Relative Percent Difference (RPD)?	Yes No
11.	Were Relative Percent Difference values within the acceptable range (i.e. ± 25%)?	Yes No

If any answer is no, explain why and what corrective action was taken:

Project/Client: 76 Service Station No. 6390 / ConocoPhillips operate
Project #: 77CP.01266.47.1100
Date of Validation: 8/25/08 **Date of Analysis:** 8-20-08 **Sample Date:** 8-18-08
Completed By: Laura Sanchez **Signature:** Laura Sanchez
Analytical Lab Used and Report # (if any): BC Labs 0810895

Circle/Highlight
Yes or No

1.	Was the analysis the one requested?	Yes No
2.	Do the sample number(s) on the chain-of-custody (COC) match the one(s) that appear on the laboratory data sheet?	Yes No
3.	Were samples prepared (extracted, filtered, etc.) within EPA holding times?	Yes No
4.	Once prepared/extracted, were the samples analyzed within the EPA holding times?	Yes No
5.	Were Laboratory blanks performed, if so, were they below non-detect?	Yes No
6.	Are the units correct? (i.e., soil samples in mg/kg or ug/g, water samples mg/L, ug/L, and air samples in volume mg/m^3,etc.)	Yes No
7.	Were appropriate Matrix Spike (MS) and Matrix Spike Duplicate (MSD) samples included in the laboratory batch sample?	Yes No
8.	In lieu of MS/ MSD, were surrogate spike (SS) or surrogate spike duplicate (SSD) samples included in the laboratory batch samples?	Yes No
9.	Were MS/ MSD (or SS/SSD) within the acceptable range of % recovery (i.e., approx 80-120% depending on analyte)?	Yes No
10.	Were MS/MSD (or SS/SSD) values used to calculate Relative Percent Difference (RPD)?	Yes No
11.	Were Relative Percent Difference values within the acceptable range (i.e. ± 25%)?	Yes No

If any answer is no, explain why and what corrective action was taken:

Notes And Definitions

MDL	Method Detection Limit
ND	Analyte Not Detected at or above the reporting limit
PQL	Practical Quantitation Limit
RPD	Relative Percent Difference
A01	PQL's and MDL's are raised due to sample dilution.
A53	Chromatogram not typical of gasoline.

PUBLIC HEALTH ASSESSMENT

July 11, 2008

Gateway Crossing Inc
Po Box 527
Burlingame CA,94011

SUBJECT: POTENTIAL GROUNDWATER CONTAMINATION IN THE VICINITY OF *402 SOUTH DELAWARE STREET, SAN MATEO, CALIFORNIA*

Dear Property Owner/Resident:

San Mateo County Groundwater Protection Program (GPP) staff have requested a list of receptors that could potentially be affected by fuel released from a service station located at the intersection of South Delaware Street and East Fourth Avenue in San Mateo. The attached map shows the location of the service station in relation to your property. Please provide the information requested below in the space provided so we can demonstrate to the County that you have been contacted. Please only complete Section A if you do not have a well, basement, or a groundwater pumping sump. It is permissible to write "unknown" if you simply do not know.

The results of this assessment will be used to determine if the water in your well or sump or air beneath/within your basement should be tested for the presence of fuel compounds. The testing would be free of charge and performed at your convenience. You will also receive a copy of the laboratory testing report. Please contact Laura Sanchez at Stantec Consulting Corporation at (916) 384-0759, or Deno Milano of the San Mateo County Groundwater Protection Program at (650) 363-4972 if you have any questions or concerns regarding this questionnaire.

The attached map shows the location of the service station in relation to your property. Please provide the information requested below in the space provided so we can demonstrate to the County that you have been contacted. Please only complete Section A if you do not have a well, basement, or a groundwater pumping sump. It is permissible to write "unknown" if you simply do not know.

The results of this assessment will be used to determine if the water in your well or sump or air beneath/within your basement should be tested for the presence of fuel compounds. The testing would be free of charge and performed at your convenience. You will also receive a copy of the laboratory testing report. Please contact Laura Sanchez at Stantec Consulting Corporation at (916) 384-0759, or Deno Milano of the San Mateo County Groundwater Protection Program at (650) 363-4972 if you have any questions or concerns regarding this questionnaire.

San Mateo Lumber
405 E 5th Ave
San Mateo,CA94402

SUBJECT: POTENTIAL GROUNDWATER CONTAMINATION IN THE VICINITY OF *402 SOUTH DELAWARE STREET, SAN MATEO, CALIFORNIA*

Dear Property Tenant:

San Mateo County Groundwater Protection Program (GPP) staff have requested a list of receptors that could potentially be affected by fuel released from a service station located at the intersection of South Delaware Street and East Fourth Avenue in San Mateo. The attached map shows the location of the service station in relation to your property. Please provide the information requested below in the space provided so we can demonstrate to the County that you have been contacted. Please only complete Section A if you do not have a well, basement, or a groundwater pumping sump. It is permissible to write "unknown" if you simply do not know.

The results of this assessment will be used to determine if the water in your well or sump or air beneath/within your basement should be tested for the presence of fuel compounds. The testing would be free of charge and performed at your convenience. You will also receive a copy of the laboratory testing report. Please contact Laura Sanchez at Stantec Consulting Corporation at (916) 384-0759, or Deno Milano of the San Mateo County Groundwater Protection Program at (650) 363-4972 if you have any questions or concerns regarding this questionnaire.

PUBLIC HEALTH ASSESSMENT

July 11, 2008

Redevelopment Agency of The City of San Mateo
330 W 20th Ave
San Mateo CA,94403-1338

SUBJECT: POTENTIAL GROUNDWATER CONTAMINATION IN THE VICINITY OF *402 SOUTH DELAWARE STREET, SAN MATEO, CALIFORNIA*

Dear Property Owner/Resident:

San Mateo County Groundwater Protection Program (GPP) staff have requested a list of receptors that could potentially be affected by fuel released from a service station located at the intersection of South Delaware Street and East Fourth Avenue in San Mateo. The attached map shows the location of the service station in relation to your property. Please provide the information requested below in the space provided so we can demonstrate to the County that you have been contacted. Please only complete Section A if you do not have a well, basement, or a groundwater pumping sump. It is permissible to write "unknown" if you simply do not know.

The results of this assessment will be used to determine if the water in your well or sump or air beneath/within your basement should be tested for the presence of fuel compounds. The testing would be free of charge and performed at your convenience. You will also receive a copy of the laboratory testing report. Please contact Laura Sanchez at Stantec Consulting Corporation at (916) 384-0759, or Deno Milano of the San Mateo County Groundwater Protection Program at (650) 363-4972 if you have any questions or concerns regarding this questionnaire.

PUBLIC HEALTH ASSESSMENT

July 11, 2008

Sonny Trust Wu
605 S Delaware Street
San Mateo CA,94402-1356

SUBJECT: POTENTIAL GROUNDWATER CONTAMINATION IN THE VICINITY OF *402 SOUTH DELAWARE STREET, SAN MATEO, CALIFORNIA*

Dear Property Owner/Resident:

San Mateo County Groundwater Protection Program (GPP) staff have requested a list of receptors that could potentially be affected by fuel released from a service station located at the intersection of South Delaware Street and East Fourth Avenue in San Mateo. The attached map shows the location of the service station in relation to your property. Please provide the information requested below in the space provided so we can demonstrate to the County that you have been contacted. Please only complete Section A if you do not have a well, basement, or a groundwater pumping sump. It is permissible to write "unknown" if you simply do not know.

The results of this assessment will be used to determine if the water in your well or sump or air beneath/within your basement should be tested for the presence of fuel compounds. The testing would be free of charge and performed at your convenience. You will also receive a copy of the laboratory testing report. Please contact Laura Sanchez at Stantec Consulting Corporation at (916) 384-0759, or Deno Milano of the San Mateo County Groundwater Protection Program at (650) 363-4972 if you have any questions or concerns regarding this questionnaire.

SECTION B: (complete if a well exists on the Property)

Number of Wells: _____ Well Diameter(s): _____
Well Depth(s): _____ Pump Depth(s): _____
Well Casing Material: _____
Date(s) the well(s) were installed: _____
How frequently are the well(s) used? _____
Approximate gallons of water pumped during each well cycle: _____
What is the well water used for? ☐ Drinking ☐ Irrigation ☐ Other: _____

SECTION C: (complete if you have a sump on the Property which pumps groundwater

Frequency of use: Sump pump in basement goes on in heavy rain.
Approximate gallons of water pumped from the sump each day: 2
Where is the water from the sump discharged? Into driveway

Please return this questionnaire in the enclosed self-addressed stamped envelope as soon as possible. A second questionnaire will be mailed to your attention if we do not receive a response within two weeks due to the importance of this issue. Again, please participate for your protection. Please include any comments you may have on the bottom of this page.

Sincerely,
Stantec Consulting Corporation

Laura Sanchez
Project Geologist
(916) 384-0759

Additional Comments: The basement does get some water in one end during heavy rains (not very often). At that time the pump should go on if water collects.
There is a test well on this driveway (a small capped opening). This was placed due to testing for Arco station at 3rd & Delaware.
Phyllis A. Outten.

PUBLIC HEALTH ASSESSMENT

July 11, 2008

Derek T Daly
704 E 5th Ave
San Mateo CA,94402-000

SUBJECT: POTENTIAL GROUNDWATER CONTAMINATION IN THE VICINITY OF *402 SOUTH DELAWARE STREET, SAN MATEO, CALIFORNIA*

Dear Property Owner/Resident:

San Mateo County Groundwater Protection Program (GPP) staff have requested a list of receptors that could potentially be affected by fuel released from a service station located at the intersection of South Delaware Street and East Fourth Avenue in San Mateo. The attached map shows the location of the service station in relation to your property. Please provide the information requested below in the space provided so we can demonstrate to the County that you have been contacted. Please only complete Section A if you do not have a well, basement, or a groundwater pumping sump. It is permissible to write "unknown" if you simply do not know.

The results of this assessment will be used to determine if the water in your well or sump or air beneath/within your basement should be tested for the presence of fuel compounds. The testing would be free of charge and performed at your convenience. You will also receive a copy of the laboratory testing report. Please contact Laura Sanchez at Stantec Consulting Corporation at (916) 384-0759, or Deno Milano of the San Mateo County Groundwater Protection Program at (650) 363-4972 if you have any questions or concerns regarding this questionnaire.

SUBJECT: POTENTIAL GROUNDWATER CONTAMINATION IN THE VICINITY OF *402 SOUTH DELAWARE STREET, SAN MATEO, CALIFORNIA*

Dear Property Tenant:

San Mateo County Groundwater Protection Program (GPP) staff have requested a list of receptors that could potentially be affected by fuel released from a service station located at the intersection of South Delaware Street and East Fourth Avenue in San Mateo. The attached map shows the location of the service station in relation to your property. Please provide the information requested below in the space provided so we can demonstrate to the County that you have been contacted. Please only complete Section A if you do not have a well, basement, or a groundwater pumping sump. It is permissible to write "unknown" if you simply do not know.

The results of this assessment will be used to determine if the water in your well or sump or air beneath/within your basement should be tested for the presence of fuel compounds. The testing would be free of charge and performed at your convenience. You will also receive a copy of the laboratory testing report. Please contact Laura Sanchez at Stantec Consulting Corporation at (916) 384-0759, or Deno Milano of the San Mateo County Groundwater Protection Program at (650) 363-4972 if you have any questions or concerns regarding this questionnaire.

Potential Tetrachloroethylene (PCE) Source Evaluation Report

76 Service Station No. 6390
402 South Delaware Street, San Mateo, CA

1.0 INTRODUCTION

Antea™Group, formerly Delta Consultants (Delta), has prepared this *Potential PCE Source Evaluation Report* to address previously reported occurrences of tetrachloroethylene (PCE, perchloroethylene) at the 76 Service Station No. 6390, located at 402 Delaware Street, San Mateo, California (**Figure 1**). This report outlines the results of the work conducted according to Delta's October 29, 2010 *Potential Tetrachloroethylene (PCE) Source Evaluation Revised Work Plan* and subsequent correspondence. The current investigation was performed in order to: 1) assess the origin of PCE typically detected in groundwater monitoring wells on and downgradient of the site, and 2) define the lateral extent of residual hydrocarbons in saturated zone soils approximately 15 feet northeast and east of the existing underground storage tank (UST) cavity. Correspondence pertinent to the work plan and this investigation is provided in **Appendix A.**

In a letter dated June 25, 2009, the San Mateo County Groundwater Protection Program (GPP) initially requested that former and existing land use be evaluated at the site and in the site vicinity and that a scope of work be prepared to investigate possible source(s) of PCE based on findings of the land use survey. Additionally, the GPP suggested that the vertical and lateral extent of hydrocarbon-impacted, saturated soils be investigated approximately 15 feet northeast and east of the UST cavity.

On December 31, 2009 Delta submitted the *Potential Source Evaluation and Tetrachloroethylene (PCE) Work Plan*. The work plan presented findings of a previous and current land use survey in the site vicinity, and it proposed the installation of four groundwater monitoring wells (MW-16B, MW-17B, MW-18B and MW-19B). In a letter dated August 9, 2010, the GPP stated that they did not concur with proposed wells MW-16B, MW-18B or MW-19B, and requested submittal of a revised Work Plan.

On October 29, 2010, Delta submitted the *Potential Source Evaluation and Tetrachloroethylene (PCE) Revised Work Plan.* The revised work plan proposed the installation of wells MW-16, MW-16B and MW-17B, in addition to seven soil borings, SB-1 through SB-7. In their February 2011 letter, the GPP did not concur with the recommended installation of MW-16 and MW-16B due to concerns that PCE was not originating from the station, that the proposed well construction may produce a dry well, and since MW-14B was considered sufficient to assess PCE in the proposed area.

The following report provides a brief site description and history and summary of regional and site hydrogeologic conditions, and a summary of data gathered while advancing six additional soil borings (SB-1, SB-3 through SB-7)

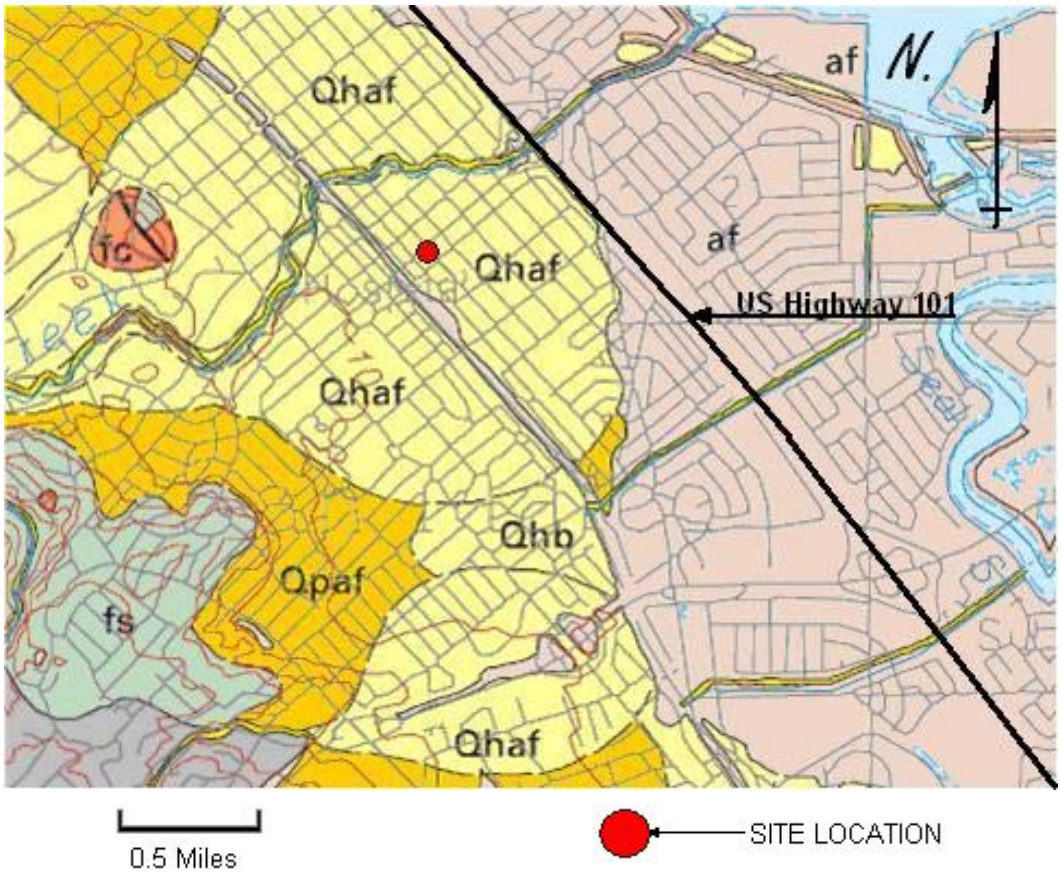
and installation of one additional groundwater monitoring well (MW-17B). The locations of these borings and well are shown on **Figure 2**.

2.0 SITE LOCATION AND DESCRIPTION

The site is a rectangular shaped property, currently occupied by an active 76 Service Station, located on the south corner at the intersection of East Fourth Avenue and South Delaware Street in San Mateo, California. The station is located approximately one mile west of San Francisco Bay, at an elevation of approximately 20 feet above mean sea level (**Figure 1**). The site facilities currently include two fuel USTs located in a common pit in the southeast portion of the property, three product dispenser islands, and a station building (**Figure 2**). The USTs were installed at the site in August 1992 during station upgrade activities. A 550-gallon waste oil UST formerly located behind the station building was removed from the site during site upgrades in 1992 (Stantec 2008). A complete summary of the site's history is presented in **Appendix B.**

The site is located in a mixed commercial and residential area. The site is bounded to the northeast by South Delaware Street and a Jiffy Lube facility (407 South Delaware Street), to the northwest by East Fourth Street and commercial buildings, to the southwest by a parking lot for a Taco Bell restaurant (500 East Fourth Avenue), and to the to the southeast by a Legal Aide of San Mateo building (521 South Delaware Street) and parking area (**Figure 3**).

There are seven existing or former gasoline service stations within ¼-mile of the site. The nearest residence is southwest of the site at 411 South Claremont approximately 50-feet southwest of the site. An apartment building is located at 603 East Fifth Avenue approximately 75-feet northeast of the site.



3.0 SITE SETTING

The following sections provide a summary of the regional geologic and hydrogeologic setting.

3.1 Regional Geologic Setting

The site is located on an alluvial plain extending from the Santa Cruz Mountains to the east to the San Francisco Bay. The geologic map of the vicinity below shows that the site is underlain by alluvial fan and fluvial deposits (Qhaf). Near the edge of San Francisco Bay, the deposits consist of medium dense sands that fine upward to sandy or silty clay (E.E. Brabb, et al., 1998). Other deposits in the area are heterogeneous artificial fill (af) and basin deposits (Qhb) consisting of fine silty clay to clay deposits.

Geologic Map of Vicinity

GEOLOGY OF THE ONSHORE PART OF SAN MATEO COUNTY, CALIFORNIA: DERIVED FROM THE DIGITAL DATABASE OPEN-FILE 98-137

3.2 Regional Hydrogeologic Setting

The site is located within the San Mateo Plain groundwater subarea, which is part of the larger South Bay Groundwater Basin. Groundwater throughout the area flows typically northeasterly, originating in the Santa Cruz Mountains to the west and flowing towards San Francisco Bay. The basin is composed of alluvial fan deposits formed by tributaries to San Francisco Bay. The water-bearing formations comprise two groups; the Santa Clara Formation of the older Plio-Pleistocene age and the Quaternary age alluvial deposits. The shallow alluvial deposits overlie the Santa Clara Formation and have a maximum depth of about 1,250-feet.

Quaternary age alluvium consists of sand, gravel, silt, and clay deposits that are about 100-feet thick and average about 60-feet thick. The Pliocene age San Mateo Formation consists of deposits of marine sand, gravel, silt, and clay, which are locally water-bearing (DWR 2003).

The prominent groundwater flow direction is to the east. A groundwater flow direction rose diagram for the site is included on **Figures 4 and 5**.

Stantec conducted a sensitive receptor survey within a ½-mile of the site between July 2008 and August 2008 (Stantec 2008). A detailed parcel survey was performed at a 500-foot radius surrounding the site. The parcel survey identified 12 properties with basements, two properties with a sump, and no properties with groundwater wells within the 500-foot radius. A field canvas by Stantec did not identify groundwater production wells, or accompanying facilities associated with groundwater production wells within the search radius. In addition, California Water Service Company, the primary water provider for the area, indicated that they did not have any water supply wells within ½-mile boundary of the survey area.

There is one surface water body identified within the limits of the ½ -mile survey. San Mateo Creek is located approximately 1,488-feet north of the site.

3.3 Site Hydrogeologic Conditions

Previous investigations have described subsurface soils as primarily clay and silt, with two potential groundwater bearing zones contained in sand and gravel layers with varying amounts of silt and clay. Fine grained deposits have been reported to extend to approximately 5 to 16 feet below ground surface (bgs). Silty sand and gravel layers were typically reported below this depth to approximately 15 to 25 feet bgs. An aquitard was reported by Stantec in 2008 at approximately 25 feet, with a thickness varying from 0.5 to 14 feet thick. A deeper groundwater bearing zone has been reported beneath this aquitard, at a depth ranging from approximately 18 to 13.5 feet bgs. Cross sections prepared in 2008 are included as **Appendix C**.

Similar deposits were noted in the current investigation. The aquitard described above appears to be semi-continuous across much of the site. To the west in the vicinity of off-site MW-2 (Endo Automotive) and SB-1, there does not appear to be a shallow coarse-grained zone. Geologic cross sections are presented as **Figures 6a, 6b and 6c**, and soils encountered in the current investigation are further described below in **Section 6.1**.

4.0 POTENTIAL SOURCES OF PCE

The following sections summarize past and recent research into the potential source(s) of PCE contamination in groundwater. Please refer to Delta's *Potential Tetrachloroethylene (PCE) Source Evaluation Revised Work Plan* dated October 29, 2010 for complete details regarding the recent PCE source investigation.

4.1 On Site

In 2009, Delta investigated potential sources of PCE. The only identified potential onsite source was a waste oil tank removed in 1992 in which two holes were observed (KEI 1992). PCE was reported in one soil sample (WO-1) collected beneath the tank at a concentration of 0.0064 milligrams per kilogram (mg/kg). Historical soil analytical data are presented in **Appendix D**.

A maximum of four data sets of PCE concentrations in groundwater have been accumulated between January 2007 and August 2008. Groundwater analyses for PCE and other halogenated volatile organic compounds (HVOCs) were discontinued based on comments in a GPP letter dated January 30, 2008, which indicated that further delineation

of the PCE source was not necessary since it appeared not to originate from the site. Thus, only limited PCE concentration data have been reported in wells MW-4, MW-6, MW-8A, MW-9, MW-12B, MW-13B, MW-14B, and MW-15B

In GPP's June 25, 2009 letter, HVOC sampling in the wells was again recommended based on reported concentrations in downgradient monitoring wells MW-12B and MW-13B. Groundwater samples from the January 2011 groundwater monitoring event were again tested for PCE, and no significant increases or decreases were noted in the data. Based on the limited data available, the PCE concentrations in groundwater at and downgradient of the site have been consistent in each well between 2007 and 2011 sampling events. Historical groundwater data are provided in **Appendix E**.

4.2 Off Site

A parcel search was performed in 2008 by Stantec and a Sanborn insurance map search was performed by Delta in 2009 to identify any former businesses or property uses which may have contributed to a PCE release. The following summarizes the results of those searches:

- The 76 Station property (subject site) has operated as a gasoline service station since 1972. Prior to this time, the property was residential.
- The property at 524 East 4th Avenue was identified as a gasoline service station in insurance maps from 1953 to 1969. Prior to this the land was a lumberyard, and currently the property is a Taco Bell restaurant and parking lot.
- Fourteen current or former dry cleaners were identified within a half mile upgradient (west) of the site. Three of the dry cleaners have active GPP cases related to the release of PCE.
- Seven gasoline service stations were identified within a quarter mile of the site, two of which were identified to be upgradient of the site.

As part of this *Potential PCE Source Evaluation Report*, Antea Group continued to search for possible offsite sources of PCE. Antea Group has found that there is an open assessment LUST cleanup site located west of the site (T. Endo Automotive, GPP Case No. 110008). Monitoring well MW-2 associated with that case is located approximately 100 feet west of off-site soil boring SB-1, or in the general up-gradient direction of the site. The well has not been monitored for HVOCs, including PCE, however, during three sampling events between September 2010 and March 2011 the analysis of TPH-G was flagged as "Atypical pattern: Gasoline value due to chlorinated compounds" by the laboratory. During the September and December 2010 sampling events, PCE in MW-2 was estimated at concentrations of 18.6 µg/L and 25.5 µg/L, respectively (Atlas Engineering Services Inc., 2011).

5.0 SCOPE OF WORK

The scope of work implemented in the current investigation consisted of two phases. The first phase was the advancement of soil borings SB-1, SB-3, SB-4, and SB-5 and the installation of MW-17B in order to evaluate PCE concentrations in soil and groundwater. The second phase involved the advancement of soil borings SB-6 and SB-7 to the west of the UST pit to evaluate the horizontal and lateral extent of hydrocarbon impacts in soil in the smear zone. Deviations from the approved scope of work included the following:

- Prior to the beginning of this investigation, the GPP requested that the initial sampling of well MW-17B be coordinated with the first quarter 2011 groundwater monitoring event. This did not occur because this investigation (and thus the scheduled installation of MW-17B) was delayed until the second quarter due to property access negotiations with the neighboring property to the west of the site for soil boring SB-5.
- Soil borings SB-1 and SB-2 were originally proposed to be advanced on the east side of Claremont Street to the west of the site. Attempts were made to install these borings on both the east and west sides of Claremont Street, but due to the high density of subsurface utilities, this was not possible. Boring SB-1 was placed on the private Taco Bell property northeast of the original proposed location. SB-2 was not drilled due to utility conflicts in the proposed location, and because additional definition was not required on the Taco Bell property.
- Soil boring SB-6 was drilled and sampled approximately three weeks after the completion of the other soil borings. The initial proposed location for soil boring SB-6 was on top of and adjacent to subsurface sewer, communication, fiber optic, and other unknown metal utilities. As the boring is located in South Delaware Street, a revised encroachment permit from the City of San Mateo was required.

The final locations of SB-1, SB-3 through SB-7, and MW-17B are shown on **Figure 2**. The results of the additional investigation and monitoring well and soil boring installations, data interpretation, and recommendations for future assessment and remedial actions are presented in the remainder of this report.

5.1 Pre Field Activities

Prior to initiation of field activities, Antea Group produced a Health and Safety Plan (HASP) in accordance with Title 8, Section 5192 of the California Code of Regulations. The HASP was reviewed daily by field personnel. Additionally, Antea Group obtained all necessary boring permits from the GPP. Copies of these permits are included as **Appendix F.** Additionally, Antea Group acquired encroachment permits from the City of San Mateo for working on Claremont Street, South Delaware Street, and East Fourth Avenue. Borehole clearance activities were carried out as outlined in Antea Group's Standard Operating Procedures presented as **Appendix G (**USA ticket number**s** 129729, 147317, 147323). All borings were cleared using an air knife, with the exception of SB-6, which was cleared with a hand auger due to the unavailability of an air knife rig on the day of drilling.

5.2 Monitoring Well Installation

One groundwater monitoring well (MW-17B) was installed at the site by Antea Group subcontractor Cascade Drilling (Cascade) under the supervision of Antea Group on May 19, 2011. Soil samples were collected continuously from MW-17B to a depth of approximately 30 feet bgs using direct push drilling equipment. The boring was then over drilled with eight-inch diameter hollow stem auger flights to a depth of 27 feet bgs for the installation of the well. Soil samples were logged and screened using the criteria outlined in **Appendix G.**

The well was constructed with six feet of screen from 21 to 27 feet bgs. Well construction details are denoted on the borings logs (**Appendix H)** and on **Table 1**.

5.3 Soil Borings

Six soil borings (SB-1, SB-3 through SB-7) were advanced at the site by Cascade, under the supervision of Antea Group, between May 17 and June 7, 2011. Soil borings were advanced as outlined in **Appendix G** using dual-tube direct push drilling methods to depths of 25 to 40 feet bgs (**Table 1**). Soil samples from the borings were continuously logged and screened. Grab groundwater samples were collected through temporary, one-inch diameter wells with five-foot intervals of pre-packed screen.

Soil samples collected during the advancement of each boring using a Geoprobe® sampling rod with 5-foot acetate liners. Samples were field screened for volatile organic compounds using a Photoionization Detector (PID). PID readings were recorded on the soil boring logs (**Appendix H**), and pertinent findings are discussed in Section 8.0, below. As part of the smear zone assessment, samples from SB-6 and SB-7 were screened at 6-inch intervals with the PID. Samples were chosen for laboratory submittal using the approved criteria in Delta's *Potential Tetrachloroethylene (PCE) Source Evaluation Revised Work Plan*. Soil samples were submitted at five-foot intervals to the bottom of each boring, and with an additional soil sample collected from 17 feet below grade to investigate a possible smear zone at that depth. Discrepancies from the work plan include:

- In boring SB-1, soil samples were not collected from depths of 15, 17, or 30 feet bgs due to poor sample recovery. Due to poor recovery, 2.5-foot sample runs were used in subsequent soil borings instead of 5-foot sampler drives; this mitigated the problem.

All soil samples collected from boring advancement and monitoring well installation activities were submitted to Pace Analytical (Pace), a California certified analytical laboratory (No. 01153CA), and analyzed for the following constituents:

- Total petroleum hydrocarbons – gasoline range organics (TPH-GRO), carbon chain range C_{05} – C_{12}, by California LUFT method;
- Benzene, toluene, ethylbenzene, total xylenes (collectively BTEX), methyl tertiary butyl ether (MTBE), tertiary-butyl alcohol (TBA), ethyl tertiary-butyl ether (ETBE), tertiary-amyl methyl ether (TAME), di-

isopropyl ether (DIPE), ethylene dibromide (EDB), ethanol, and 1,2-dicholoethane (1,2-DCA) by EPA Method 8260;

- Total 1,2 dichloroethene (1,2-DCE), cis-1,2 dichloroethene (cis-1,2-DCE), PCE, trichloroethylene (TCE), chloroform, and vinyl chloride by EPA Method 8260..

5.4 Grab Groundwater Sampling

Grab groundwater samples were collected from SB-1, SB-3, SB-4, SB-6, and SB-7 following boring advancement. Samples were collected using a temporary 1-inch schedule 40 PVC casing with a 5-foot pre-pack filter screen attached and placed at the bottom of each boring. The sampling interval in each soil boring was consistent with the materials and depths associated with "Zone B" groundwater. Procedures for grab groundwater sampling are contained in **Appendix G**.

Boring SB-5 was initially advanced to 30 feet bgs, at which depth the drilling crew attempted to collect a groundwater sample. After 35 minutes, no groundwater had entered into the boring, so the crew advanced the boring to 40 feet bgs, where another attempt to collect a groundwater sample was made. After approximately 20 minutes, no groundwater had gathered in the boring. No groundwater sample was collected from SB-5.

All grab groundwater samples collected from were submitted to Pace and analyzed for the following constituents:

- TPH-GRO, carbon chain range C_{05} – C_{12}, by California LUFT method; and
- BTEX, MTBE, TBA, ETBE, TAME, DIPE, EDB, ethanol, 1,2-DCA by EPA Method 8260.
- Total 1,2-DCE, cis-1,2-DCE, PCE, TCE, chloroform, and vinyl chloride by EPA Method 8260.

5.5 Monitoring Well Development

Under the supervision of Antea Group personnel, the newly installed monitoring well (MW-17B) was developed on May 27, 2011 by Cascade by surging and then bailing approximately 10 well casing volumes from the well, followed by purging via a submersible pump. In total, approximately 50 gallons of water were purged from the well. A well development log is included as **Appendix I**.

5.6 Monitoring Well Survey

The newly installed monitoring well (MW-17B) was surveyed on June 6, 2011, by Midcoast Engineers, under the supervision of Antea Group. Longitude and latitude were surveyed to North American Datum 83. The top of casing elevation was surveyed to North American Vertical Datum 88. The survey data have been included as **Appendix J.** As required by the State of California Water Resources Control Board, the survey information was also uploaded to Geotracker.

5.7 Monitoring Well Sampling

On June 7, 2011, newly installed monitoring well MW-17B was gauged and sampled for the first time. Groundwater samples were analyzed for:

- TPH-GRO, carbon chain range C_{05} – C_{12}, by California LUFT method;
- BTEX, MTBE, TBA, ETBE, TAME, DIPE, EDB, ethanol, 1,2-DCA by EPA Method 8260; and
- Total 1,2-DCE, cis-1,2-DCE, PCE, TCE, chloroform, and vinyl chloride by EPA Method 8260.

5.8 Disposal of Investigation Derived Waste

Nine drums were transported by Antea Group's waste management contractor Belshire Environmental Services, Inc. on June 20, 2011. Four drums of soil were transported to Soil Safe in Adelanto, California on July 6, 2011 and three purge/decontamination water drums were disposed at Demenno Kerdoon in Compton, California on June 27, 2011. The remaining two drums contained pavement debris, which is not a tracked waste stream. Debris is brought to a landfill or recycling center and is not reported by the waste hauler. Non Hazardous Waste Manifests for soil and groundwater generated during the investigation are presented as **Appendix K.**

6.0 INVESTIGATION RESULTS

The following sections discuss subsurface conditions and the distribution of PCE and petroleum hydrocarbons in soil and groundwater samples collected as part of this investigation.

6.1 Subsurface Conditions

Soils beneath the site consisted of primarily silt and clay and semi-continuous layers of sands and gravels with varying amounts of clay and silt to the total depth explored of 40 feet bgs. Coarse-grained layers vary from approximately 8 feet to less than a foot in thickness. It appears that two water bearing zones are present beneath the site, the upper Zone A extending from approximately 5 to 15 feet bgs, and the deeper Zone B beginning at approximately 15 to 25 feet bgs. Zone A is comprised mostly of clayey/silty sands, while Zone B has a greater amount of clean sands and gravels. Groundwater was typically encountered in the borings at depths ranging from 14 feet bgs (SB-4, SB-7 and MW-17B) to 21 feet bgs (SB-6). Wells that are screened in Zone A (MW-9, MW-10 and MW-11) have been consistently reported dry during groundwater monitoring events, with three exceptions in MW-9, including the first quarter 2011 sampling event. Zone A is believed to be a semi-continuous, seasonally perched water bearing zone, since the only groundwater samples collected from the zone have been in January or February. Geologic cross sections are presented on **Figures 6a, 6b and 6c**.

6.2 Soil Analytical Results

Soil sample analytical results are summarized in **Tables 2a and 2b** and shown on **Figure 4**. Certified laboratory analytical reports are included in **Appendix L**.

6.2.1 PCE Distribution in Soil

PCE was detected in soil samples upgradient of the site in soil borings SB-1, SB-4, and SB-5, and downgradient of the site in soil borings SB-6 and SB-7 at depths ranging between 15 and 40 feet below grade. No PCE detections were reported above the Regional Water Quality Control Board (RWQCB) Environmental Screening Level (ESL) of 0.37 mg/kg.

Detections of PCE in soil samples collected from on-site borings are consistent with detections in borings upgradient of the site, indicating that the source of the PCE in soil is likely upgradient of the subject site.

PCE is known to degrade to TCE, then DCE compounds, then to vinyl chloride and finally to ethene and ethane (EPA 1998). Additionally, chloroform is a common compound used in dry cleaning. In addition to PCE, soil samples were analyzed for chlorinated solvents including TCE, total 1,2-DCE, cis-1,2-DCE and chloroform.

Cis-1,2-DCE, TCE and chloroform were all reported above laboratory reporting limits in SB-7, though no concentrations were above their respective ESLs. The presence of cis 1,2-DCE and TCE indicate that PCE appears to be degrading by the time it reaches the site.

6.2.2 Smear Zone Evaluation

Soil borings SB-6 and SB-7 were advanced approximately 15 feet east and southeast of the UST complex to investigate residual petroleum concentrations in soil. Soil samples collected from SB-6 and SB-7 show the presence of TPH-GRO and BTEX in soil between 15 and 25 feet below grade. MTBE was detected only in the soil sample SB-6d15, at a concentration of 0.0099 mg/kg, which is below the ESL of 0.023 mg/kg.

Soil samples from SB-6 show minimal residual impact in soil in the smear zone between 15 and 20 feet below grade. Soil samples in boring SB-7 show remaining hydrocarbon impacts between 15 and 20 feet below grade, with TPH-GRO concentrations above ESLs, ranging from 1,330 mg/kg (SB-7d15) to 4,900 mg/kg (SB-7d20), and benzene concentrations above ESLs, ranging from 0.066 mg/kg (SB-7d17) to 0.80 mg/kg (SB-7d20). The soil impacts in boring SB-7 indicate that residual soil impacts remain in soil southeast of the UST complex, and exceedance of the ESLs was limited to soil samples between 15 and 20 feet below grade.

PID readings were recorded every 1/2-foot through the smear zone in SB-6 and SB-7 (Appendix H). Elevated PID readings were observed in SB-6 and SB-7 from approximately 15 to 21 feet bgs and 12 to 24 feet bgs, respectively, with maximum PID readings at 17 feet bgs (3,639 parts per molar volume [ppmv]) in SB-6 and 19.5 feet (3,687 ppmv) in SB-7. PID readings appear to be consistent with reported soil concentrations shown in the table below.

Sample ID	Date Sampled	Sample Depth (fbg)	TPH-GRO (mg/kg)	BTEX				MTBE (mg/kg)
				Benzene (mg/kg)	Toluene (mg/kg)	Ethylbenzene (mg/kg)	Xylenes (mg/kg)

6.3 Groundwater Analytical Results

Grab groundwater samples were collected from soil borings SB-1, SB-3, SB-4, SB-6, and SB-7. Additionally, monitoring well MW-17B was purged and sampled following installation and development. Groundwater sample analytical results are summarized in **Tables 3a and 3b** and shown on **Figure 5**. Certified laboratory analytical reports are included in **Appendix L**.

6.3.1 PCE Distribution in Groundwater

PCE was detected in all groundwater samples collected in this investigation. Groundwater samples collected from upgradient soil borings SB-1, SB-3, and SB-4 establish background PCE concentrations ranging from 1.9 micrograms per liter (µg/l) to 38.9 µg/l. The presence of PCE in groundwater from upgradient borings indicates the possibility of an upgradient source to the west or northwest of the site, assuming groundwater flow in the vicinity is consistent with that onsite.

The highest concentration of PCE detected in groundwater samples collected during this investigation was 103 µg/L from downgradient soil boring SB-6. This concentration is similar to those that have been reported in groundwater samples collected from the monitoring wells and grab samples on and in the vicinity or upgradient of the subject site. It should be noted that this concentration may be anomalous since the groundwater sample was collected through a temporary well in a soil boring rather than a permanent well. This could be caused by sediment content in the sample, lack of purging, temporary well screen depth, a poor seal by the dual tube sampler, or other factors.

The presence of PCE breakdown products total 1,2-DCE, c-1,2-DCE, and TCE in groundwater collected from borings SB-1, SB-6 and SB-7 indicates that the PCE plume in the site vicinity has undergone some degradation. Chloroform is a compound often used in commercial dry cleaning, which is not a breakdown product of PCE. Its presence in borings SB-1, SB-4 and SB-6 indicates the groundwater contaminant plume in the site vicinity contains other compounds used in commercial dry cleaning.

Sample ID	Sample Date	PCE (µg/L)	TCE (µg/L)	(Total) 1,2 DCE (µg/L)	Cis 1,2 DCE (µg/L)	Chloroform (µg/L)	Location
SB-1	5/18/11	**38.9**	**4.7**	**15.0**	**15.0**	**4.8**	Up Gradient
SB-3	5/18/11	**1.9**	<1.0	<2.0	<1.0	<1.0	Up Gradient
SB-4	5/18/11	**11.9**	<1.0	<2.0	<1.0	**2.7**	Up Gradient
SB-6	6/7/11	**103**	**15.2**	**16.2**	**16.2**	**2.2**	Down Gradient
SB-7	5/18/11	**6.7**	**3.4**	**3.4**	**3.4**	<1.0	Down Gradient
MW-17B	6/7/11	**9.3**	<1.0	<2.0	<1.0	**1.0**	On Site
ESL	--	**5.0**	**5.0**	**--**	**6.0**	**70**	--

6.3.2 Hydrocarbon Distribution in Groundwater

Analytes were detected above their respective ESLs in grab groundwater samples collected from soil borings SB-1, SB-6 and SB-7. The table below compares analyte concentrations reported in groundwater samples collected from SB-1, SB-6 and SB-7 to ESLs.

Sample ID	Date Sampled	TPH-GRO (µg/L)	BTEX				MTBE (µg/L)	TBA (µg/L)
			Benzene (µg/L)	Toluene (µg/L)	Ethylbenzene (µg/L)	Xylenes (µg/L)		
SB-1	05/18/11	**111**	<0.50	<0.50	<0.50	<1.5	<0.50	<5.0
SB-6	06/07/11	**45,800**	**40.5**	**1,230**	**1,420**	**7,430**	**1.5**	<5.0
SB-7	05/18/11	**166,000**	**2,790**	**15,600**	**4,080**	**21,000**	**1,160**	**2950**
CRWQCB ESLs		**100**	**1.0**	**40**	**30**	**20**	**5.0**	**12**

7.0 QUALITY ASSURANCE/QUALITY CONTROL (QA/QC)

Antea Group performed a QA/QC data validation check on the certified laboratory soil and grab groundwater analytical reports for the current investigation. Certified laboratory reports from Pace and lab validation forms completed by Antea Group are contained in **Appendix L.** The following laboratory data qualifiers were noted individual samples and on laboratory control samples:

- C0 - Result confirmed by second analysis. This data qualifier was noted on the analysis of vinyl chloride in the sample SB-7d20.

- D6 - The relative percent difference (RPD) between the sample and sample duplicate exceeded laboratory control limits. The data qualifier was noted on the matrix spike/matrix spike duplicate (MS/MSD) samples 72635 and 72636 for the analysis of TBA. The high RPD in the MS set impacts the precision of the TBA result, however TBA was not detected in the sample; therefore, the quality of the result should not be affected.
- L2 - Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results for this analyte in associated samples may be biased low. This data qualifier was noted on laboratory control sample (LCS) 72205 for the analysis vinyl chloride, and in the sample SB-7d20 for the analysis of vinyl chloride.
- L3 - Analyte recovery in the laboratory control sample (LCS) exceeded QC limits. Analyte presence below reporting limits in associated samples. Results unaffected by high bias. This data qualifier was noted on LCS 72638for the analysis of TBA, and in the COMP ABCD sample for 1,2-DCE and ethanol.
- M0 - Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits. This data qualifier was noted on MS/MSD samples 72531 and 72532 for the analysis of vinyl chloride and MS/MSD 72771 and 72772 for 1,2-DCE and ethanol. The low recovery in the MS set creates a potential low bias in the result, however the parent sample was a quality control sample, not part of this project. Therefore, the quality of the data should not be affected.
- M1 - Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery. This data qualifier was noted on the sample MW-17Bd17 for the analysis of TAME, and on sample SB-6 for the analysis of TPH-GRO. This was also noted on several MS/MSD samples for multiple analyses.
- S5 - Surrogate recovery outside control limits due to matrix interferences (not confirmed by re-analysis). This data qualifier was noted on surrogates on samples SB-7, SB-7d17, and SB-7d20. Certain analytes from sample SB-7 may be biased low, while some analytes from samples SB-7d17 and SB-7d20 may be biased high.
- S2 - Surrogate recovery outside laboratory control limits due to matrix interferences (confirmed by similar results from sample re-analysis). This data qualifier was noted on MS/MSD samples 74459 and 74460.
- R1 – Relative percentage difference (RPD) was outside control limits. This data qualifier was noted on lead MS/MSD in the COMP ABCD sample, however the MS/MSD was not run on a sample from this project, so results are considered valid.

All pertinent data qualifiers have been noted on **Tables 2a** through **3b.**

8.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the results of this investigation, Antea Group has concluded the following:

- The site subsurface consists of a discontinuous perched water bearing zone (Zone A) from approximately 5 to 15 feet bgs, and a lower continuous water bearing zone (Zone B) below approximately 15 to 25 feet bgs. Water zones are generally separated by a clay/silt layer of varying thickness.
- Groundwater and soil samples collected from upgradient soil borings SB-1, SB-3, and SB-4, as well as past groundwater results from up-gradient monitoring well MW-2 associated with the T. Endo Automotive LUST case, indicate that there is an upgradient source of PCE affecting groundwater and soil in the area of the subject site. Antea Group has identified several upgradient sites that may be possible contributors to PCE in the region.
- Upgradient of the station in SB-1 and SB-4, PCE was reported in groundwater at concentrations exceeding the ESL of 5.0 µg/l. Background groundwater quality in the site vicinity currently does not meet standards for drinking water.
- Based on PID profiles and soil samples analyzed from borings SB-6 and SB-7, residual petroleum-impacted soils remain to the east of the current fuel UST complex, and a smear zone is present between 15 and 21 feet bgs. Hydrocarbon impacted soil in this area is vertically defined by less-than ESL and non-detect concentrations below 25 feet below grade. Based on these results, soils in this area may become part of a target area for future soil remediation.
- Elevated concentrations of hydrocarbons were detected in grab groundwater samples collected from soil borings SB-6 and SB-7. These groundwater samples were collected with temporary well screens set between 20-30 feet below grade, similar to the depth interval of the "deep," or Zone B site wells. Petroleum impacted groundwater in this area extends beyond the site into South Delaware Street and contaminant plumes are defined to low and non-detect concentrations to the east and southeast (downgradient) by deep wells MW-4, MW-12B, and MW-15B.

Based upon the findings of this investigation, Antea Group recommends the following:

- Due to the widespread presence of PCE in groundwater and soil upgradient of the site (at similar concentrations to those found in samples collected onsite and downgradient and exceeding the groundwater ESLs), Antea Group recommends discontinuing any further onsite and downgradient PCE evaluations. Additionally, Antea Group recommends that chlorinated solvents (HVOCs) be removed from the analytical parameter list in the site's groundwater monitoring program.
- Antea Group recommends the addition of MW-17B to the sites current Semi Annual groundwater monitoring and sampling program.
- Based upon the magnitude of petroleum hydrocarbon impacted soil in soil boring SB-7 and the extent of impacted groundwater beyond the site to the east and southeast, Antea Group recommends preparation of a remedial action investigation work plan. The work plan will also address elevated soil and groundwater concentrations in the vicinity of well MW-6. Based upon soil samples collected in soil boring SB-6, soil remediation is not recommended to the east of the UST complex in Delaware Street.

9.0 REMARKS

The recommendations contained in this report represent Antea USA, Inc.'s professional opinions based upon the currently available information and are arrived at in accordance with currently accepted professional standards. This report is based upon a specific scope of work requested by the client. The contract between Antea USA, Inc. and its client outlines the scope of work, and only those tasks specifically authorized by that contract or outlined in this report were performed. This report is intended only for the use of Antea USA, Inc.'s client and anyone else specifically identified in writing by Antea USA, Inc. as a user of this report. Antea USA, Inc. will not and cannot be liable for unauthorized reliance by any other third party. Other than as contained in this paragraph, Antea USA, Inc. makes no express or implied warranty as to the contents of this report.

Notes:

<	Denotes less than the Practical Quantitation Limit (PQL)	ESL	Environmental screening level
--	Not applicable / measured	GW	Groundwater
mg/kg	Milligrams per kilogram	MTBE	Methyl tertiary butyl ether
CRWQCB	California Regional Water Quality Control Board	PQL	Practical Quantitation Limit
EPA	U.S. Environmental Protection Agency	TPH-GRO	Total petroleum hydrocarbons as gasoline range organics
TBA	Tert butyl alcohol	TOC	Top of casing
1,2-DCA	1,2-Dichloroethane	ETBE	Ethyl Tert Butyl Ether
EDB	1,2-Dibromoethane		
DIPE	Diisopropyl Ether		
TAME	Tert Amyl Methyl Ether		
1	Analyzed by method CA LUFT		
2	Analyzed by EPA Method 8260B.		

Laboratory Data Qualifiers:

S5	Surrogate recovery outside control limits due to matrix interferences (not confirmed by re-analysis). Noted on toluene-d8 (S)
S5 *	Surrogate recovery outside control limits due to matrix interferences (not confirmed by re-analysis). Noted on toluene-d8 (S) and 4-Bromofluorobenzene (S)
S5 **	Surrogate recovery outside control limits due to matrix interferences (not confirmed by re-analysis). Noted on dibromofluorobenzene (S)
M1	Matrix spike recovery exceeded QC limits. Batch excepted based on laboratory control sample (LCS) recovery.

CRWQCB	California Regional Water Quality Control Board
EPA	U.S. Environmental Protection Agency
NA	Not Analyzed

2	Analyzed by EPA Method 8260B.

Laboratory Data Qualifiers:

S5	Surrogate recovery outside control limits due to matrix interferences (not confirmed by re-analysis). Noted on toluene-d8 (S)
S5 *	Surrogate recovery outside control limits due to matrix interferences (not confirmed by re-analysis). Noted on toluene-d8 (S) and 4-Bromofluorobenzene (S)
CO	Result confirmed by second analysis.
L2	Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results for this analyte in associated samples may be biased low.

SUBJECT: CONOCOPHILLIPS 76 STATION #6390 AT 402 SOUTH DELAWARE STREET, SAN MATEO, CALIFORNIA

Dear Ms. Lathrop:

Thank you for the September 8, 2008, assessment and sensitive receptor survey report and associated addendums, and the April 23, 2009, groundwater monitoring report prepared by Stantec Consulting Company (Stantec). The following comments are based on San Mateo County Groundwater Protection Program (GPP) staff review of these documents and the project file.

Assessment and Sensitive Survey Receptor Report

GPP staff consider this report one of the best reports we have received regarding the topics covered. We appreciate the concise detail and the manner in which the information was presented. The report greatly assists in identifying the environmental drivers at the subject site.

The greatest concentrations of tetrachloroethene (PCE) were reported in wells MW-12B and MW-13B located downgradient of the former waste oil tank and low levels of PCE were reported in the 1992 soil sample collected from the waste oil tank cavity. Therefore, assessing the origin of the PCE, as previously recommended by Stantec, now appears warranted. Please identify the former and existing use of the parcels bounded by East Fourth and Fifth Avenue and South Delaware Street and South Claremont Street, incorporate these findings into a workplan that details and justifies a scope of work to assess the origin of this PCE, and upload the workplan to the State GeoTracker database by **December 31, 2009**. Please note, the PCE concentrations in the groundwater samples from MW-12B and MW-13B exceed the Regional Water Quality Control Board (RWQCB) residential land use Environmental Screening Level (ESL) for inhalation concerns. Therefore, assessing the inhalation risk of this PCE appears warranted; however, we will postpone our decision to require ConocoPhillips to perform this work pending our review of the results of the PCE source investigation work.

The report indicates remediation may be necessary near MW-6 if the dissolved-phase hydrocarbon concentrations in this well remain near the levels reported. Therefore, please consider incorporating into the workplan required above a scope of work to assess the lateral extent of residual hydrocarbons in saturated zone soils approximately 15 feet northeast and east of the existing fuel UST cavity. This information would not only assist in identifying the target

treatment zone of remediation, but may demonstrate significant residual impact to saturated zone soil is limited to the northeast end of the fuel UST cavity (i.e. remediation not warranted providing other RWQCB low-risk case closure criteria are satisfied).

Monitoring Report

The monitoring results support the upward component to groundwater flow concluded in the September 2008 assessment report. Please continue to report on the vertical gradient.

The report indicates a portion of the TPH concentrations in some samples are from PCE eluting in the TPH analytical range. Please consider footnoting the analytical results table in future reports to indicate this condition. Please also analyze the groundwater samples for halogenated volatile organic compounds unless ConocoPhillips can demonstrate the PCE did not originate from the subject site.

Please call me at (650) 372-6292 if you have any questions.

Sincerely,

Deno G. Milano, P.G.

Risk Management & Remediation Group
ConocoPhillips
76 Broadway
Sacramento, CA 95818

SUBJECT: CONOCOPHILLIPS 76 STATION #6390 AT 402 SOUTH DELAWARE STREET, SAN MATEO, CALIFORNIA

Dear Ms. Lathrop:

Thank you for uploading to the State GeoTracker database the following documents prepared by Delta Consultants: 1) workplan dated December 31, 2009, and 2) groundwater monitoring report dated May 14, 2010. The following comments are based on San Mateo County Groundwater Protection Program (GPP) staff review of these documents and the project file.

Workplan

It does not appear the workplan will adequately assess the extent of the smear zone impact surrounding the fuel UST cavity and the origin of the tetrachloroethene (PCE) reported in groundwater samples (the objectives of the work). Proposed Monitoring Well MW-19B may confirm what we already know (that significant hydrocarbons exist in smear zone soils adjacent to the fuel UST cavity) and a well at this location does not appear justified based on the proximity of existing MW-6 and MW-13B (a boring in Delaware Street and perhaps in the eastern corner of the site may satisfy the objective). It also does not appear that proposed onsite Monitoring Wells MW-16B through MW-18B would cost-effectively assess the origin of the PCE in groundwater. The workplan identified potential PCE sources upgradient of the subject site (e.g. Wardrobe Cleaners; Figure 3 in Attachment C). Therefore, installing three monitoring wells onsite does not appear useful or necessary when it has not been established whether ConocoPhillips is responsible for the PCE (upgradient grab groundwater samples appear more appropriate at this time). We could support proposed MW-16B, but only if the PCE concentrations reported in upgradient grab groundwater samples approximated acceptable laboratory reporting limits (would support a ConocoPhillips source for the PCE). Therefore,

given the foregoing discussion, please upload to the State GeoTracker database by **October 29, 2010**, a revised workplan that will satisfy the objectives of the investigation.

The workplan indicates perched groundwater exists at this site. Please note, no justification has been provided to GPP staff to demonstrate a perched groundwater zone exists at the subject site. Please also note, the information referenced in Appendix G is not complete.

Groundwater Monitoring Report

The sampling and monitoring information table on the top of Page 3 of the report indicates the nearest water supply well is 250 feet northwest of the site. This is incorrect. Please refer to the previous receptor survey reports (2008 and 1996) for the location of nearby water supply wells.

The report indicates the wells were re-sampled in March 2010 because samples were not collected for halogenated volatile organic compound (HVOC) analysis during the normal monitoring event in January 2010. Except for the sampling of MW-9 and MW-11, the UST Cleanup Fund may only reimburse the laboratory costs for the March 2010 event because HVOC analyses were required in our letter dated June 25, 2009.

The report indicates MW-10 dewatered during purging. Please reduce the purging rate for this well to minimize potential dewatering. If the well dewaters during the next monitoring event, then please collect a "no-purge' sample from this well during subsequent monitoring events and denote the sample collection method on the appropriate report table(s).

The report references elevations to mean sea level. Please note, the well casing elevations for the subject site were referenced to North American Vertical Datum-1988 which is not equivalent to mean seal level. The elevation notes on report tables also do not concur with the GeoZ files in the State GeoTracker database.

The report states an upward hydraulic head potential existed between MW-6 and MW-13B on January 18, 2010. This conclusion appears to apply to March 2010 based on the groundwater elevations listed in Table 2. Please note, conclusions regarding hydraulic head differential may be limited when the differential (0.01 foot in January 2010) approximates the accuracy of well gauging. Please also note, some of the dates and groundwater elevations listed in Table 2 for MW-10 and MW-11 are incorrect.

The Blain Tech Services purging and sampling procedures in Attachment B differ from the purging and sampling procedures used before environmental responsibilities were recently transferred to Delta Consultants. The previously approved procedures should be used unless the Registered Professional can justify changes prior to implementation.

It appears the groundwater monitoring at the subject site can be reduced to annual frequency following the Third Quarter 2010 event. Please implement this change unless the Registered Professional can justify the greater frequency.

Closing Comments

It is our understanding ConocoPhillips may have sold the subject site and perhaps their environmental liability; however, we have not received any correspondence confirming that this has occurred. Please note, even if this transaction has been finalized, GPP staff will still consider ConocoPhillips the Primary Responsible Party for the release currently being assessed. While ConocoPhillips' may enforce the assignment of their environmental responsibility in the courts as a civil matter, such assignment does not legally relieve ConocoPhillips of their Responsible Party status under the California Health and Safety Code. Therefore, we will continue to address our letters to ConocoPhillips and, as a courtesy, copy our letters to Delta Consultants.

Please call me at (650) 372-6292 if you have any questions.

Sincerely,

SUBJECT: UNOCAL 76 STATION #6390 AT 402 SOUTH DELAWARE STREET, SAN MATEO, CALIFORNIA

Dear Mr. Frohnapple and Ms. Lathrop:

Thank you for uploading to the State GeoTracker database the October 29, 2010, revised workplan prepared by Delta Consultants (now Antea Group). The following comments are based on San Mateo County Groundwater Protection Program (GPP) staff review of the workplan and the project file.

The most recent groundwater monitoring information referenced in the workplan was August 2008; however, monitoring data through July 2010 was available at the time the workplan was written. Please ensure all available and pertinent data is used to prepare documents.

Section 6 of the workplan states analysis of groundwater samples for tetrachloroethene (PCE) was discontinued based on the GPP staff letter dated January 30, 2008. Please note, our more recent letter dated June 25, 2009, reinstated groundwater analysis for PCE because of the PCE concentrations reported in newly installed Monitoring Wells MW-12B and MW-13B. We reiterated this requirement in our letter dated August 9, 2010.

Proposed Borings SB-1 through SB-7 and proposed Monitoring Well MW-17B are approved with the following conditions:

- Consider relocating proposed SB-5 between Sample WO-1 and the building located on the eastern corner of East Fourth Avenue and Claremont Street (would help assess the property between the former waste oil UST and proposed SB-1 through SB-4);
- Use site well gauging data in determining the depth to groundwater in the borings;
- Ensure the temporary pre-packed screen is installed across an appropriate interval for PCE assessment in groundwater and is removed prior to grouting (these procedures were not discussed in the workplan and the field procedures are for hydropunch™ sampling);

- It does not appear necessary to use conductor casing during the installation of MW-17B given the contaminant concentrations reported, the proposed well construction, and the minimal time it will take to construct the well;

- Postponing the drilling of MW-17B at 16 feet below grade (fbg) in order to sample groundwater at the water table does not appear necessary because nearby MW-9 provides some monitoring data on this portion of the saturated zone;

- Settle the filter pack prior to installing the sanitary seal of MW-17B;

- Attempt to coordinate the collection of groundwater samples from MW-17B with the first quarter 2011 groundwater monitoring event;

- Consider limiting the soil samples submitted for laboratory analysis from SB-6 and SB-7 to those collected between 10 and 25 fbg unless sample screening indicates otherwise (samples from 5 and 30 fbg do not appear necessary based on historical data); and

- Submit to the State GeoTracker database by **July 28, 2011**, all electronic files required by California Code of Regulations Title 23, Division 3, Chapter 30, including a report detailing and justifying the methods, findings, conclusions, and recommendations of the investigation.

The report must indicate how investigative derived wastes were disposed and include scaled figures (base-10 preferred) and data analytical tables sufficient to support conclusions regarding contaminant extent, stability, and risk. It would be beneficial if at least one figure identified all sampling locations to date and the report included tables summarizing historical gauging data and the laboratory results of all soil, groundwater, and subsurface vapor sampling analyses performed to date (one table for soil, one for groundwater, and one for vapor is preferred). It would also be beneficial if each table indicated the date and depth of sample collection, as appropriate, and the proper field point name (FPN). FPNs must be consistent between text, figures, tables, and boring logs. Please note, the scale shown on Figure 3 is incorrect. Please ensure the correct scale is shown on the figures in the investigative report.

Closing Comments

GPP staff cannot at this time support the proposed installation of MW-16 and MW-16B. We do not support MW-16 because: 1) it has not been established the PCE originated from the 76 station; 2) the proposed screen interval may result in a typically dry well like MW-9; and 3) the well does not appear necessary for the assessment of the fuel release based on the soil sampling results from D3, P5, P6, and SP-6. We do not support MW-16B because it appears MW-14B is sufficient to assess the dissolved-phase PCE in this area.

Please note, the 0.0064 mg/kg PCE concentration reported in soil Sample WO-1 at 8 fbg does not demonstrate the former waste oil UST leaked PCE. This sample is within the reported interval of groundwater fluctuation; therefore, it is possible the PCE in this sample originated

from PCE-affected groundwater migrating from an upgradient source. We hope the proposed investigation will clarify this issue.

Please call me at (650) 372-6292 if you have any questions.

Sincerely,

Deno G. Milano, PG

Appendix B

Site Assessment History Summary

SITE LOCATION AND BACKGROUND

The site is currently an active "76"-branded service station. The station is located approximately one mile west of San Francisco Bay in San Mateo, California, at an elevation of approximately 20 feet above mean sea level. The site facilities include two fuel underground storage tanks (USTs) located in a common pit in the southeast portion of the property, three product dispenser islands, and a station building. The USTs were installed at the site in August 1992 during station upgrade activities. A 550-gallon waste oil UST formerly located behind the station building was removed from the site during site upgrades in 1992.

The site is bounded to the northeast by South Delaware Street and a Jiffy Lube facility (407 South Delaware Street), to the northwest by East Fourth Street and commercial buildings, to the southwest by a parking lot for a Taco Bell restaurant (500 East Fourth Avenue), and to the to the southeast by a Legal Aide of San Mateo building (521 South Delaware Street) and parking area.

There are seven existing or former gasoline service stations within ¼-mile of the site area. The site is located in a mixed commercial and residential area. The nearest residences are southwest of the site at 411 South Claremont, or approximately 50 feet southwest of the site, and an apartment building is located at 603 East Fifth Avenue approximately 75 feet northeast of the site.

SUMMARY OF PREVIOUS ENVIRONMENTAL INVESTIGATIONS

Historically, gasoline range petroleum hydrocarbons have been analyzed and reported by various methods and reported as various acronyms (e.g. TPPH and TPH-g). Antea will be analyzing and reporting gasoline range hydrocarbons as gasoline range organics (GRO), by CA-LUFT GC/MS (a non-Environmental Protection Agency (EPA) Test Method), unless referring to data in a historical context.

In August 1992, Kaprealian Engineering, Inc. (KEI) observed the removal of two 12,000-gallon, fiberglass, gasoline underground storage tanks (USTs), one 550-gallon waste oil UST, and the associated product piping and dispensers. Upon removal of one of super unleaded gasoline UST, a 9-inch long crack was observed along its eastern end. Petroleum hydrocarbon contamination was observed at the eastern end of the gasoline UST cavity. The cavity was over-excavated to remove as much of the impacted soil as possible, resulting in a final excavation that measured approximately 30' by 27' by 22' deep. Initially, six soil samples (A1, A2, B1, B2, SW1, and SW2) were collected from the bottom and sidewalls of the UST cavity, one soil sample (WO1) was collected from the bottom of the waste oil UST cavity, and six soil samples (P1, P2, P3, P4, P5, and P6) were collected from the bottom of the product piping trenches.

At a later date, KEI collected an additional three soil samples (SW1, SW2, and SW3) from the gasoline UST cavity, along with a grab groundwater sample (W1). The water sample was collected after a total of approximately 5,800 gallons of water had been pumped form the gasoline UST cavity. The groundwater was observed to have floating

product and a heavy sheen. Additionally, KEI collected three soil samples (D1, D2, and D3) from beneath the gasoline dispensers. Laboratory analyses of soil samples collected from the gasoline UST cavity reported relatively high levels of total petroleum hydrocarbons as gasoline (TPHg) benzene, toluene, ethylbenzene, and total xylenes (BTEX compounds), and total petroleum hydrocarbons as diesel (TPHd). The requested petroleum hydrocarbon constituents were not reported above laboratory detection limits in the soil samples collected from the product piping trenches and from beneath the gasoline dispensers. Laboratory analysis of the soil sample from the waste oil UST indicated the presence of the heavy metals cadmium, chromium, nickel, lead and zinc, while the remaining petroleum hydrocarbon constituents were not indicated at concentrations above the laboratory detection limits. High levels of TPHd, TPHg, and BTEX compounds were also reported in the groundwater sample.

In May 1994, KEI installed three monitoring wells (MW-1, MW-2 and MW-3) at the site. Laboratory analyses of the soil samples collected from the borings for monitoring wells MW-2 and MW-3 indicated the presence of TPHg and BTEX compounds. The requested petroleum hydrocarbon constituents were not reported above laboratory detection limits in the soil samples collected form the MW-1 borehole. The wells were initially gauged and sampled in June 1994. Laboratory analyses of the water samples collected from MW-2 and MW-3 reported the presence of petroleum hydrocarbons in MW-2 and MW-3. The depth to water ranged from 15.33 to 16.71 feet below ground surface (bgs) with a groundwater gradient reported at 0.004 foot/foot to the east. KEI concluded to follow a three-month (quarterly) monitoring program.

In March 1995, two additional monitoring wells (MW-4 and MW-5) were installed at downgradient, off-site locations in the sidewalk along the opposite side of South Delaware Street from the site. Laboratory analyses of the soil samples collected from the monitoring well boreholes indicated the presence of TPHg and BTEX contamination in MW-4. The new wells were added to the quarterly groundwater monitoring program and were first sampled in April 1995. Laboratory analyses of the water samples collected from MW-4 and MW-5 indicated the presence of maximum concentrations of 150,000 micrograms per liter (µg/L) TPHg, 12,000 µg/L benzene, 40,000 µg/L toluene, 4,700 µg/L ethylbenzene, and 31,000 µg/L total xylenes reported in MW-4.

In January 1996, GeoStrategies (GSI) observed the excavation and removal of a 150 gallon capacity oil/water separator. A confirmation soil sample (OWS-S-4.5) was collected from underneath the oil/water separator at a depth of 4.5 feet bgs. Laboratory analysis of the sample indicated the presence of trace concentrations of TPHd, toluene, and total xylenes. Additionally, the presence of the heavy metals chromium, nickel, lead, and zinc were indicated at concentrations of 160 milligrams per kilogram (mg/kg), 99 mg/kg, 13 mg/kg, and 69 mg/kg, respectively.

In February 1996, KEI supervised the advancement of three Geoprobe® soil borings (SP1, SP2, and SP4) at off-site locations. The soil borings were terminated at a depth of 13 feet bgs, with groundwater encountered at approximately 10.5 feet bgs. Grab groundwater samples were collected from each borehole. Laboratory analyses of the water samples reported low to moderate levels of TPHg, benzene, ethylbenzene, and total xylenes in the sample from boring SP-4. Petroleum hydrocarbon constituents were not reported above laboratory detection limits in the groundwater samples from borings SP-1 and SP-2.

In June 1996, Pacific Environmental Group, Inc. (Pacific) performed a well survey and reviewed California Department of Water Resources (DWR) well records. Four documented wells were identified within a ¼-mile radius of the site.

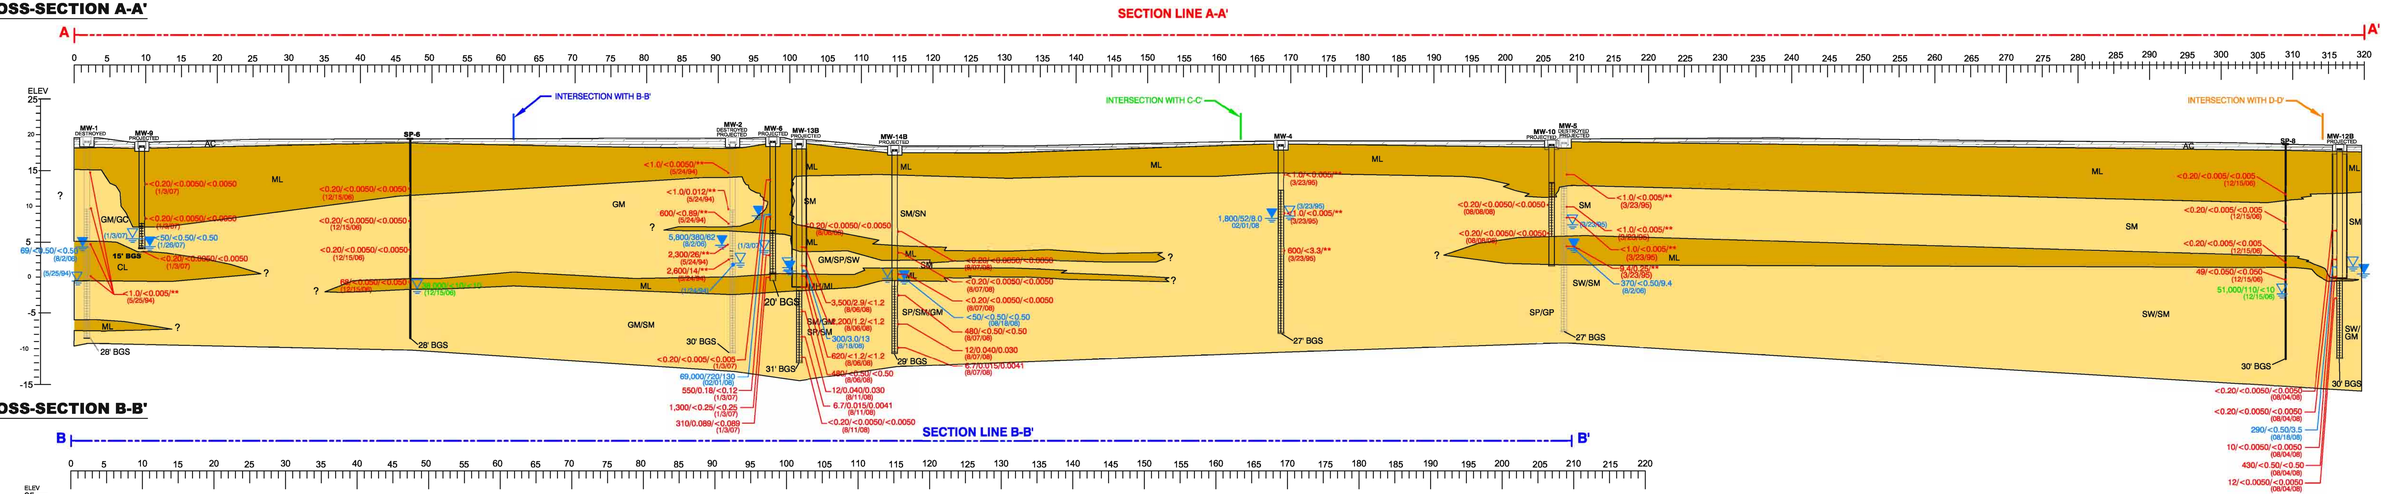
In December 2006 and January 2007, SECOR supervised the following activities: advancement of four direct push soil borings (SP-5 through SP-8), the installation of three soil vapor wells (VP-1 through VP-3) and four additional groundwater monitoring wells (MW-6 through MW-9), and the destruction of four groundwater monitoring wells (MW-1, MW-2, MW-3, and MW-5). Laboratory analyses of soil samples collected indicated the presence of up to 1,300 mg/kg total purgeable petroleum hydrocarbons (TPPH, MW-6@16.5-17), 0.18 mg/kg benzene (MW-6@11-11.5), 32 mg/kg toluene (MW-6@11-11.5), 20 mg/kg ethylbenzene (MW-6@11-11.5), 110 mg/kg total xylenes (MW-6@11-11.5), and 0.089 mg/kg methyl tertiary butyl ether (MTBE, MW-6@19.5-20). Grab groundwater sample analytical results indicated the presence of up to 51,000 µg/L TPPH (SP-8), 1,300 µg/L benzene (SP-5), 1,500 µg/L toluene (SP-5), 3,000 µg/L ethylbenzene (SP-8), 9,600 µg/L total xylenes (SP-8), and 330 µg/L MTBE (SP-5). Groundwater samples from MW-6 and MW-9 reported petroleum hydrocarbons. Laboratory analyses of the soil vapor samples indicated the presence of up to 0.75 micrograms per liter (µg/L) TPPH (VP-3), up to 16 µg/L toluene (VP-1), 14 µg/L ethylbenzene (VP-3), 42 µg/L m,p-xylenes (VP-3), and 29 µg/L o-xylenes (VP-3). Based on the results of this investigation, SECOR concluded that hydrocarbons in soil had been adequately delineated, the lateral extent of hydrocarbons in groundwater had been delineated up-gradient and cross-gradient, the lateral extent of hydrocarbons in deeper groundwater had been delineated to the southwest (cross-gradient) by SP-7, and that vapor inhalation did not appear to be an exposure pathway at the site. SECOR recommended installation of a downgradient well in the shallow water bearing zone and downgradient wells in the deeper water bearing zone along East Fifth Avenue and Delaware Street, and to the northwest and northeast (up and cross-gradient) of the site. SECOR recommended groundwater analyses and historical research to identify the possible source of tetrachloroethylene (PCE) in groundwater.

In August 2008, Stantec oversaw the installation of two shallow groundwater monitoring wells (MW-10 and MW-11), and four deeper zone wells (MW-12B, MW-13B, MW-14B, and MW-15B) at locations down-gradient of the subject site. This included the collection of both soil and groundwater samples from the new wells. Stantec also completed a sensitive receptor survey (SRS) as part of this investigation. Stantec concluded that petroleum hydrocarbon plumes in groundwater had been delineated by the new wells, but recommended continued semiannual groundwater monitoring. No additional evaluation of sensitive receptors was recommended based on findings of the SRS (where no sensitive receptors were identified in the immediate down-gradient direction of the site).

Between 2009 and 2010, Delta Consultants has prepared an investigation work plan to assess the PCE contamination in groundwater in the vicinity of the site. Following submittal of a *Potential Source Evaluation and Tetrachloroethene (PCE) Source Evaluation Revised Work Plan on October 29, 2010,* Delta is awaiting approval from the lead oversight agency before implementing the work plan, which includes additional soil and groundwater

testing at on and off-site locations in order to identify whether the subject site is a source of PCE contamination in groundwater, or if that contamination has originated from elsewhere.

In February 2011, Antea Group (formerly Delta Consultants) received conditional approval from the lead oversight agency, San Mateo County GPP, of their October 29, 2010 submittal titled *Potential Source Evaluation and Tetrachloroethene (PCE) Source Evaluation Revised Work Plan.*



May through June 2011, Antea Group oversaw the installation of one additional groundwater monitoring well MW-17B, and the advancement of six soil borings SB-1 and SB-3 through SB-7 to assess the potential up-gradient presence of PCE in soil and groundwater, as well as to further quantify the degree and extent of on-site and downgradient hydrocarbon contamination associated with the subject site. Details of the investigation are presented in the July 2011 *Potential Tetrachloroethylene (PCE) Source Investigation Report*.

Groundwater at the site has been monitored since the second quarter 1994. Between 1994 and 2000, the site was monitored on a quarterly basis. Since 2001, the frequency has been reduced to semi-annual monitoring. Approval from the lead agency to reduce the monitoring frequency to annual sample was approval in August 2010. In December 2010 the agency requested the annual sampling be moved to First Quarter, rather than the previously requested Third Quarter. Starting with the First Quarter 2011 event, annual events will be held every January. Historically, the highest dissolved phase petroleum hydrocarbon concentrations have occurred in wells MW-2 and MW-3, and most recently in well MW-6. The groundwater gradient has been mainly to the east and southeast, and was to the northeast during the last event.

1	Analyzed by EPA Method 3550/8015M
2	Analyzed by Standard Method 5520 E&F (Gravimetric)
3	Analyzed by EPA Method 5030/8015M between 8/1992 and 3/1995; by EPA Method 8260 between 12/2006 and the present.
4	Analyzed by EPA Method 8020 between 8/1992 and 3/1995; by EPA Method 8260 between 12/2006 and the present.
5	Analyzed by EPA Method 8260B
6	Analyzed by EPA Method 6000/7000
a	Sample was analyzed for Halogenated Volatile Organic Hydrocarbons (HVOCs) by EPA Method 8010. Tetrachloroethene was detected at 0.0064 mg/kg. The additional HVOCs were reported as non-detect.
b	Chromatograph pattern: Diesel and non-diesel mixture (<C14; >C22).
c	Sample was analyzed for HVOCs by EPA Method 8010. All HVOCs were reported as non-detect.
d	The Continuing Calibration Verification (CCV) recovery was not within established control limits.
e	The PQL'S and MDL's was raised due to sample dilution.
f	Estimated Value (CLP Flags)

Gauging Notes:

TOC - Top of Casing

ft - Feet

NP - LNAPL not present

LNAPL - Light non-aqueous phase liquid

* - Corrected for LNAPL if present (assumes LNAPL specific gravity = 0.75)

NG - Not gauged

NSVD - Not surveyed

DRY - Well is dry

-- - No information available

Analytical Notes:

-- - No information available

< - Not detected at or above indicated laboratory reporting limit

ug/L - micrograms/liter

GRO- gasoline range organics

MTBE- Methyl tertiary-butyl ether

TBA- Tertiary-butyl alcohol

DIPE- Di-isopropyl ether

ETBE- Ethyl tertiary-butyl ether

TAME- Tertiary-amyl methyl ether

 2011 SUBSURFACE DRILLING PERMIT APPLICATION

REQUIREMENTS:

An accurate & correct map of existing and proposed well/boring locations **must** be included with the permit application. The well/boring location map **must** include the following.

1. North arrow, existing & historic site features, wells, approximate property lines and any other pertinent existing & historic features and information.
2. Proposed well/boring locations to scale.

A work plan describing the drilling and construction/destruction methodology, at a minimum, is **required** by County Staff. Upon review of information on this application and the submitted work plan, and subject to approval noted below, a permit will be issued allowing well/boring owner, driller, and responsible professional (consultant) to perform the specified work. The permit is subject to both General and Special Conditions stated below. A copy of the approved Subsurface Drilling Permit **must** be available on site while work related to the permit is being performed. Drilling may begin at the notified date and time whether County staff is present or not.

GENERAL CONDITIONS:

A. Well and boring construction and destruction under this permit is subject to the Standards for the Construction of Wells in San Mateo County, County Groundwater Protection Program (GPP) Guidelines, Policies & Procedures, the State Water Well Standards, and any instructions by a Health Department representative.

B. Well/Boring Owner, Driller, and Responsible Professional assume responsibility for all activities and uses under the permit, including compliance with Workmen's Compensation Laws, and indemnify, defend and save the County of San Mateo, its' officers, agents and employees, free and harmless from any and all expense, cost, or liability in connection with or resulting from work or stopped-work associated with the permit, including, but not limited to, property damage, personal injury, wrongful death, and loss of income.

C. All borings **must** be properly destroyed (grouted/sealed) within 24 hours of drilling unless special conditions are approved in writing as part of this permit.

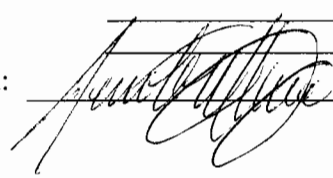
D. Analytical results of all soil and groundwater samples collected during the execution of drilling under this permit **must** be submitted to County GPP staff by the Responsible Professional within 60 days of sample collection. If contamination is discovered during drilling, verbal notification to County GPP by the Responsible Professional is **required** within 72 hours of discovery. Proper storage, labeling & disposal of investigation-derived residual wastes are the responsibility of the consultant unless stated otherwise contractually.

E. A copy of the State DWR Form 188, boring logs and well construction details for all borings/wells except geotechnical borings, signed by a Responsible Professional, **must** be submitted to County GPP by the Responsible Professional within 60 days of drilling/construction/destruction. As-built locations/dimensions **must** be finalized in subsequent report of findings submitted to County GPP by the Responsible Professional within 60 days of drilling/construction/destruction.

F. Permit is valid only for the purpose specified herein. No change in purpose or required procedures, as described on this permit application, in the associated workplan, or in the special conditions below, will be allowed except upon written permission from the County. Construction aspects can be changed based on conditions encountered in the field.

G. Permit is valid for mobilizations associated with originally permitted boring/monitoring well locations only, including contingency locations, and is automatically canceled if not exercised, or if an extension is not applied for and granted by County GPP, within 120 days of the original permit issuance date. Failure to notify staff of cancellation or delay in start time, at least one minute prior to the notified start time, will result in the Consultant being billed an Inspection Cancellation fee of $264 for 2011 if GPP staff attempted to perform an inspection.

H. Wells installed under this permit may not be used for domestic, municipal, commercial, or irrigation water supply.



I. All work plans and reports related to work performed under County oversight **must** conform to Business and Profession Codes and State Water Well Standards.

J. Top-of-casing elevation of all wells **must** be surveyed to the nearest 0.01-foot relative to Mean Sea Level (NAVD88) and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate. Geotechnical wells are exempt from this requirement if a written variance from GPP is obtained prior to drilling.

K. Latitude and longitude of all wells **must** be surveyed with sub-meter accuracy relative to NAD83 and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate.

L. Violation of any requirement or general or special permit condition may result in an order by GPP staff to cease work under this permit, correct the violation, and potentially re-permit the work as a new mobilization.

SPECIAL CONDITIONS:_____

County Approval:  RO/SD# 534 Date: 4.18.2011

330 West 20th Avenue
San Mateo, California, 94403

Re: **Letter of Intent – Soil Borings in East 4th Avenue, South Delaware Street, Claremont Street**
76 Service Station No. 6390
402 South Delaware Street
San Mateo, California

Dear Mr. Heap:

Antea™Group has prepared this letter of intent regarding the proposed environmental investigation related to 76 Service Station No. 6390, located at 402 South Delaware Avenue in San Mateo, California (see attached **Site Plan**).

This subsurface investigation was proposed by Delta Consultants (now Antea Group) in a work plan dated October 29, 2010, and approved by the San Mateo County Groundwater Protection Program (SMC-GPP) in their letter dated February 8, 2011. This work is being done to address previously reported occurrences of tetrachloroethylene (PCE, perchloroethylene) at 76 Service Station No. 6390. The environmental investigation work approved by the SMC-GPP which encroaches on City of San Mateo public right-of-ways includes the following:

> *Installation of six (6) borings located in streets around the city block containing 76 Service Station No. 6390. Proposed borings are located in front of the service station in South Delaware Street, and in Claremont Street and East 4th Avenue near the intersection of Claremont Street and East 4th Avenue. Depending on site access, one boring (SB-5) may be moved onto private property. All borings will be advanced to a depth of 30 feet below grade or until groundwater is first encountered for the purpose of soil and groundwater sampling. Upon completion, all borings will be abandoned and finished to match the existing grade. The proposed boring locations are shown on the attached* ***Site Plan****.*

Per San Mateo County drilling permit application instructions, Antea Group will use this Letter of Intent, once approved, as an attachment to the San Mateo County drilling permit application to satisfy the property owner signature requirement. Following San Mateo County approval of the drilling permit application, Antea Group will submit a complete encroachment permit package to the City of San Mateo.

If you have any questions or need additional information, please call me at (408) 826-1868.

Sincerely,

Matt Corley

 2011 SUBSURFACE DRILLING PERMIT APPLICATION

REQUIREMENTS:

An accurate & correct map of existing and proposed well/boring locations **must** be included with the permit application. The well/boring location map **must** include the following.

1. North arrow, existing & historic site features, wells, approximate property lines and any other pertinent existing & historic features and information.
2. Proposed well/boring locations to scale.

A work plan describing the drilling and construction/destruction methodology, at a minimum, is **required** by County Staff. Upon review of information on this application and the submitted work plan, and subject to approval noted below, a permit will be issued allowing well/boring owner, driller, and responsible professional (consultant) to perform the specified work. The permit is subject to both General and Special Conditions stated below. A copy of the approved Subsurface Drilling Permit **must** be available on site while work related to the permit is being performed. Drilling may begin at the notified date and time whether County staff is present or not.

GENERAL CONDITIONS:

A. Well and boring construction and destruction under this permit is subject to the Standards for the Construction of Wells in San Mateo County, County Groundwater Protection Program (GPP) Guidelines, Policies & Procedures, the State Water Well Standards, and any instructions by a Health Department representative.

B. Well/Boring Owner, Driller, and Responsible Professional assume responsibility for all activities and uses under the permit, including compliance with Workmen's Compensation Laws, and indemnify, defend and save the County of San Mateo, its' officers, agents and employees, free and harmless from any and all expense, cost, or liability in connection with or resulting from work or stopped-work associated with the permit, including, but not limited to, property damage, personal injury, wrongful death, and loss of income.

C. All borings **must** be properly destroyed (grouted/sealed) within 24 hours of drilling unless special conditions are approved in writing as part of this permit.

D. Analytical results of all soil and groundwater samples collected during the execution of drilling under this permit **must** be submitted to County GPP staff by the Responsible Professional within 60 days of sample collection. If contamination is discovered during drilling, verbal notification to County GPP by the Responsible Professional is **required** within 72 hours of discovery. Proper storage, labeling & disposal of investigation-derived residual wastes are the responsibility of the consultant unless stated otherwise contractually.

E. A copy of the State DWR Form 188, boring logs and well construction details for all borings/wells except geotechnical borings, signed by a Responsible Professional, **must** be submitted to County GPP by the Responsible Professional within 60 days of drilling/construction/destruction. As-built locations/dimensions **must** be finalized in subsequent report of findings submitted to County GPP by the Responsible Professional within 60 days of drilling/construction/destruction.

F. Permit is valid only for the purpose specified herein. No change in purpose or required procedures, as described on this permit application, in the associated workplan, or in the special conditions below, will be allowed except upon written permission from the County. Construction aspects can be changed based on conditions encountered in the field.

G. Permit is valid for mobilizations associated with originally permitted boring/monitoring well locations only, including contingency locations, and is automatically canceled if not exercised, or if an extension is not applied for and granted by County GPP, within 120 days of the original permit issuance date. Failure to notify staff of cancellation or delay in start time, at least one minute prior to the notified start time, will result in the Consultant being billed an Inspection Cancellation fee of $264 for 2011 if GPP staff attempted to perform an inspection.

H. Wells installed under this permit may not be used for domestic, municipal, commercial, or irrigation water supply.

I. All work plans and reports related to work performed under County oversight **must** conform to Business and Profession Codes and State Water Well Standards.

J. Top-of-casing elevation of all wells **must** be surveyed to the nearest 0.01-foot relative to Mean Sea Level (NAVD88) and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate. Geotechnical wells are exempt from this requirement if a written variance from GPP is obtained prior to drilling.

K. Latitude and longitude of all wells **must** be surveyed with sub-meter accuracy relative to NAD83 and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate.

L. Violation of any requirement or general or special permit condition may result in an order by GPP staff to cease work under this permit, correct the violation, and potentially re-permit the work as a new mobilization.

Re: **Letter of Intent – Soil Borings in East 4th Avenue, South Delaware Street, Claremont Street**
76 Service Station No. 6390
402 South Delaware Street
San Mateo, California

Dear Mr. Heap:

Antea™Group has prepared this letter of intent regarding the proposed environmental investigation related to 76 Service Station No. 6390, located at 402 South Delaware Avenue in San Mateo, California (see attached **Site Plan**).

This subsurface investigation was proposed by Delta Consultants (now Antea Group) in a work plan dated October 29, 2010, and approved by the San Mateo County Groundwater Protection Program (SMC-GPP) in their letter dated February 8, 2011. This work is being done to address previously reported occurrences of tetrachloroethylene (PCE, perchloroethylene) at 76 Service Station No. 6390. The environmental investigation work approved by the SMC-GPP which encroaches on City of San Mateo public right-of-ways includes the following:

> *Installation of six (6) borings located in streets around the city block containing 76 Service Station No. 6390. Proposed borings are located in front of the service station in South Delaware Street, and in Claremont Street and East 4th Avenue near the intersection of Claremont Street and East 4th Avenue. Depending on site access, one boring (SB-5) may be moved onto private property. All borings will be advanced to a depth of 30 feet below grade or until groundwater is first encountered for the purpose of soil and groundwater sampling. Upon completion, all borings will be abandoned and finished to match the existing grade. The proposed boring locations are shown on the attached* ***Site Plan.***

Per San Mateo County drilling permit application instructions, Antea Group will use this Letter of Intent, once approved, as an attachment to the San Mateo County drilling permit application to satisfy the property owner signature requirement. Following San Mateo County approval of the drilling permit application, Antea Group will submit a complete encroachment permit package to the City of San Mateo.

If you have any questions or need additional information, please call me at (408) 826-1868.

 2011 SUBSURFACE DRILLING PERMIT APPLICATION

REQUIREMENTS:

An accurate & correct map of existing and proposed well/boring locations **must** be included with the permit application. The well/boring location map **must** include the following.

1. North arrow, existing & historic site features, wells, approximate property lines and any other pertinent existing & historic features and information.
2. Proposed well/boring locations to scale.

A work plan describing the drilling and construction/destruction methodology, at a minimum, is **required** by County Staff. Upon review of information on this application and the submitted work plan, and subject to approval noted below, a permit will be issued allowing well/boring owner, driller, and responsible professional (consultant) to perform the specified work. The permit is subject to both General and Special Conditions stated below. A copy of the approved Subsurface Drilling Permit **must** be available on site while work related to the permit is being performed. Drilling may begin at the notified date and time whether County staff is present or not.

GENERAL CONDITIONS:

A. Well and boring construction and destruction under this permit is subject to the Standards for the Construction of Wells in San Mateo County, County Groundwater Protection Program (GPP) Guidelines, Policies & Procedures, the State Water Well Standards, and any instructions by a Health Department representative.

B. Well/Boring Owner, Driller, and Responsible Professional assume responsibility for all activities and uses under the permit, including compliance with Workmen's Compensation Laws, and indemnify, defend and save the County of San Mateo, its' officers, agents and employees, free and harmless from any and all expense, cost, or liability in connection with or resulting from work or stopped-work associated with the permit, including, but not limited to, property damage, personal injury, wrongful death, and loss of income.

C. All borings **must** be properly destroyed (grouted/sealed) within 24 hours of drilling unless special conditions are approved in writing as part of this permit.

D. Analytical results of all soil and groundwater samples collected during the execution of drilling under this permit **must** be submitted to County GPP staff by the Responsible Professional within 60 days of sample collection. If contamination is discovered during drilling, verbal notification to County GPP by the Responsible Professional is **required** within 72 hours of discovery. Proper storage, labeling & disposal of investigation-derived residual wastes are the responsibility of the consultant unless stated otherwise contractually.

E. A copy of the State DWR Form 188, boring logs and well construction details for all borings/wells except geotechnical borings, signed by a Responsible Professional, **must** be submitted to County GPP by the Responsible Professional within 60 days of drilling/construction/destruction. As-built locations/dimensions **must** be finalized in subsequent report of findings submitted to County GPP by the Responsible Professional within 60 days of drilling/construction/destruction.

F. Permit is valid only for the purpose specified herein. No change in purpose or required procedures, as described on this permit application, in the associated workplan, or in the special conditions below, will be allowed except upon written permission from the County. Construction aspects can be changed based on conditions encountered in the field.

G. Permit is valid for mobilizations associated with originally permitted boring/monitoring well locations only, including contingency locations, and is automatically canceled if not exercised, or if an extension is not applied for and granted by County GPP, within 120 days of the original permit issuance date. Failure to notify staff of cancellation or delay in start time, at least one minute prior to the notified start time, will result in the Consultant being billed an Inspection Cancellation fee of $264 for 2011 if GPP staff attempted to perform an inspection.

H. Wells installed under this permit may not be used for domestic, municipal, commercial, or irrigation water supply.

I. All work plans and reports related to work performed under County oversight **must** conform to Business and Profession Codes and State Water Well Standards.

J. Top-of-casing elevation of all wells **must** be surveyed to the nearest 0.01-foot relative to Mean Sea Level (NAVD88) and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate. Re: **Letter of Intent – Soil Borings in East 4th Avenue, South Delaware Street, Claremont Street**
76 Service Station No. 6390
402 South Delaware Street
San Mateo, California

Dear Mr. Heap:

Antea™Group has prepared this letter of intent regarding the proposed environmental investigation related to 76 Service Station No. 6390, located at 402 South Delaware Avenue in San Mateo, California (see attached **Site Plan**).

This subsurface investigation was proposed by Delta Consultants (now Antea Group) in a work plan dated October 29, 2010, and approved by the San Mateo County Groundwater Protection Program (SMC-GPP) in their letter dated February 8, 2011. This work is being done to address previously reported occurrences of tetrachloroethylene (PCE, perchloroethylene) at 76 Service Station No. 6390. The environmental investigation work approved by the SMC-GPP which encroaches on City of San Mateo public right-of-ways includes the following:

> *Installation of six (6) borings located in streets around the city block containing 76 Service Station No. 6390. Proposed borings are located in front of the service station in South Delaware Street, and in Claremont Street and East 4th Avenue near the intersection of Claremont Street and East 4th Avenue. Depending on site access, one boring (SB-5) may be moved onto private property. All borings will be advanced to a depth of 30 feet below grade or until groundwater is first encountered for the purpose of soil and groundwater sampling. Upon completion, all borings will be abandoned and finished to match the existing grade. The proposed boring locations are shown on the attached* ***Site Plan.***

Per San Mateo County drilling permit application instructions, Antea Group will use this Letter of Intent, once approved, as an attachment to the San Mateo County drilling permit application to satisfy the property owner signature requirement. Following San Mateo County approval of the drilling permit application, Antea Group will submit a complete encroachment permit package to the City of San Mateo.

 2011 SUBSURFACE DRILLING PERMIT APPLICATION

REQUIREMENTS:

An accurate & correct map of existing and proposed well/boring locations **must** be included with the permit application. The well/boring location map **must** include the following.

1. North arrow, existing & historic site features, wells, approximate property lines and any other pertinent existing & historic features and information.
2. Proposed well/boring locations to scale.

A work plan describing the drilling and construction/destruction methodology, at a minimum, is **required** by County Staff. Upon review of information on this application and the submitted work plan, and subject to approval noted below, a permit will be issued allowing well/boring owner, driller, and responsible professional (consultant) to perform the specified work. The permit is subject to both General and Special Conditions stated below. A copy of the approved Subsurface Drilling Permit **must** be available on site while work related to the permit is being performed. Drilling may begin at the notified date and time whether County staff is present or not.

GENERAL CONDITIONS:

A. Well and boring construction and destruction under this permit is subject to the Standards for the Construction of Wells in San Mateo County, County Groundwater Protection Program (GPP) Guidelines, Policies & Procedures, the State Water Well Standards, and any instructions by a Health Department representative.

B. Well/Boring Owner, Driller, and Responsible Professional assume responsibility for all activities and uses under the permit, including compliance with Workmen's Compensation Laws, and indemnify, defend and save the County of San Mateo, its' officers, agents and employees, free and harmless from any and all expense, cost, or liability in connection with or resulting from work or stopped-work associated with the permit, including, but not limited to, property damage, personal injury, wrongful death, and loss of income.

C. All borings **must** be properly destroyed (grouted/sealed) within 24 hours of drilling unless special conditions are approved in writing as part of this permit.

D. Analytical results of all soil and groundwater samples collected during the execution of drilling under this permit **must** be submitted to County GPP staff by the Responsible Professional within 60 days of sample collection. If contamination is discovered during drilling, verbal notification to County GPP by the Responsible Professional is **required** within 72 hours of discovery. Proper storage, labeling & disposal of investigation-derived residual wastes are the responsibility of the consultant unless stated otherwise contractually.

E. A copy of the State DWR Form 188, boring logs and well construction details for all borings/wells except geotechnical borings, signed by a Responsible Professional, **must** be submitted to County GPP by the Responsible Professional within 60 days of drilling/construction/destruction. As-built locations/dimensions **must** be finalized in subsequent report of findings submitted to County GPP by the Responsible Professional within 60 days of drilling/construction/destruction.

F. Permit is valid only for the purpose specified herein. No change in purpose or required procedures, as described on this permit application, in the associated workplan, or in the special conditions below, will be allowed except upon written permission from the County. Construction aspects can be changed based on conditions encountered in the field.

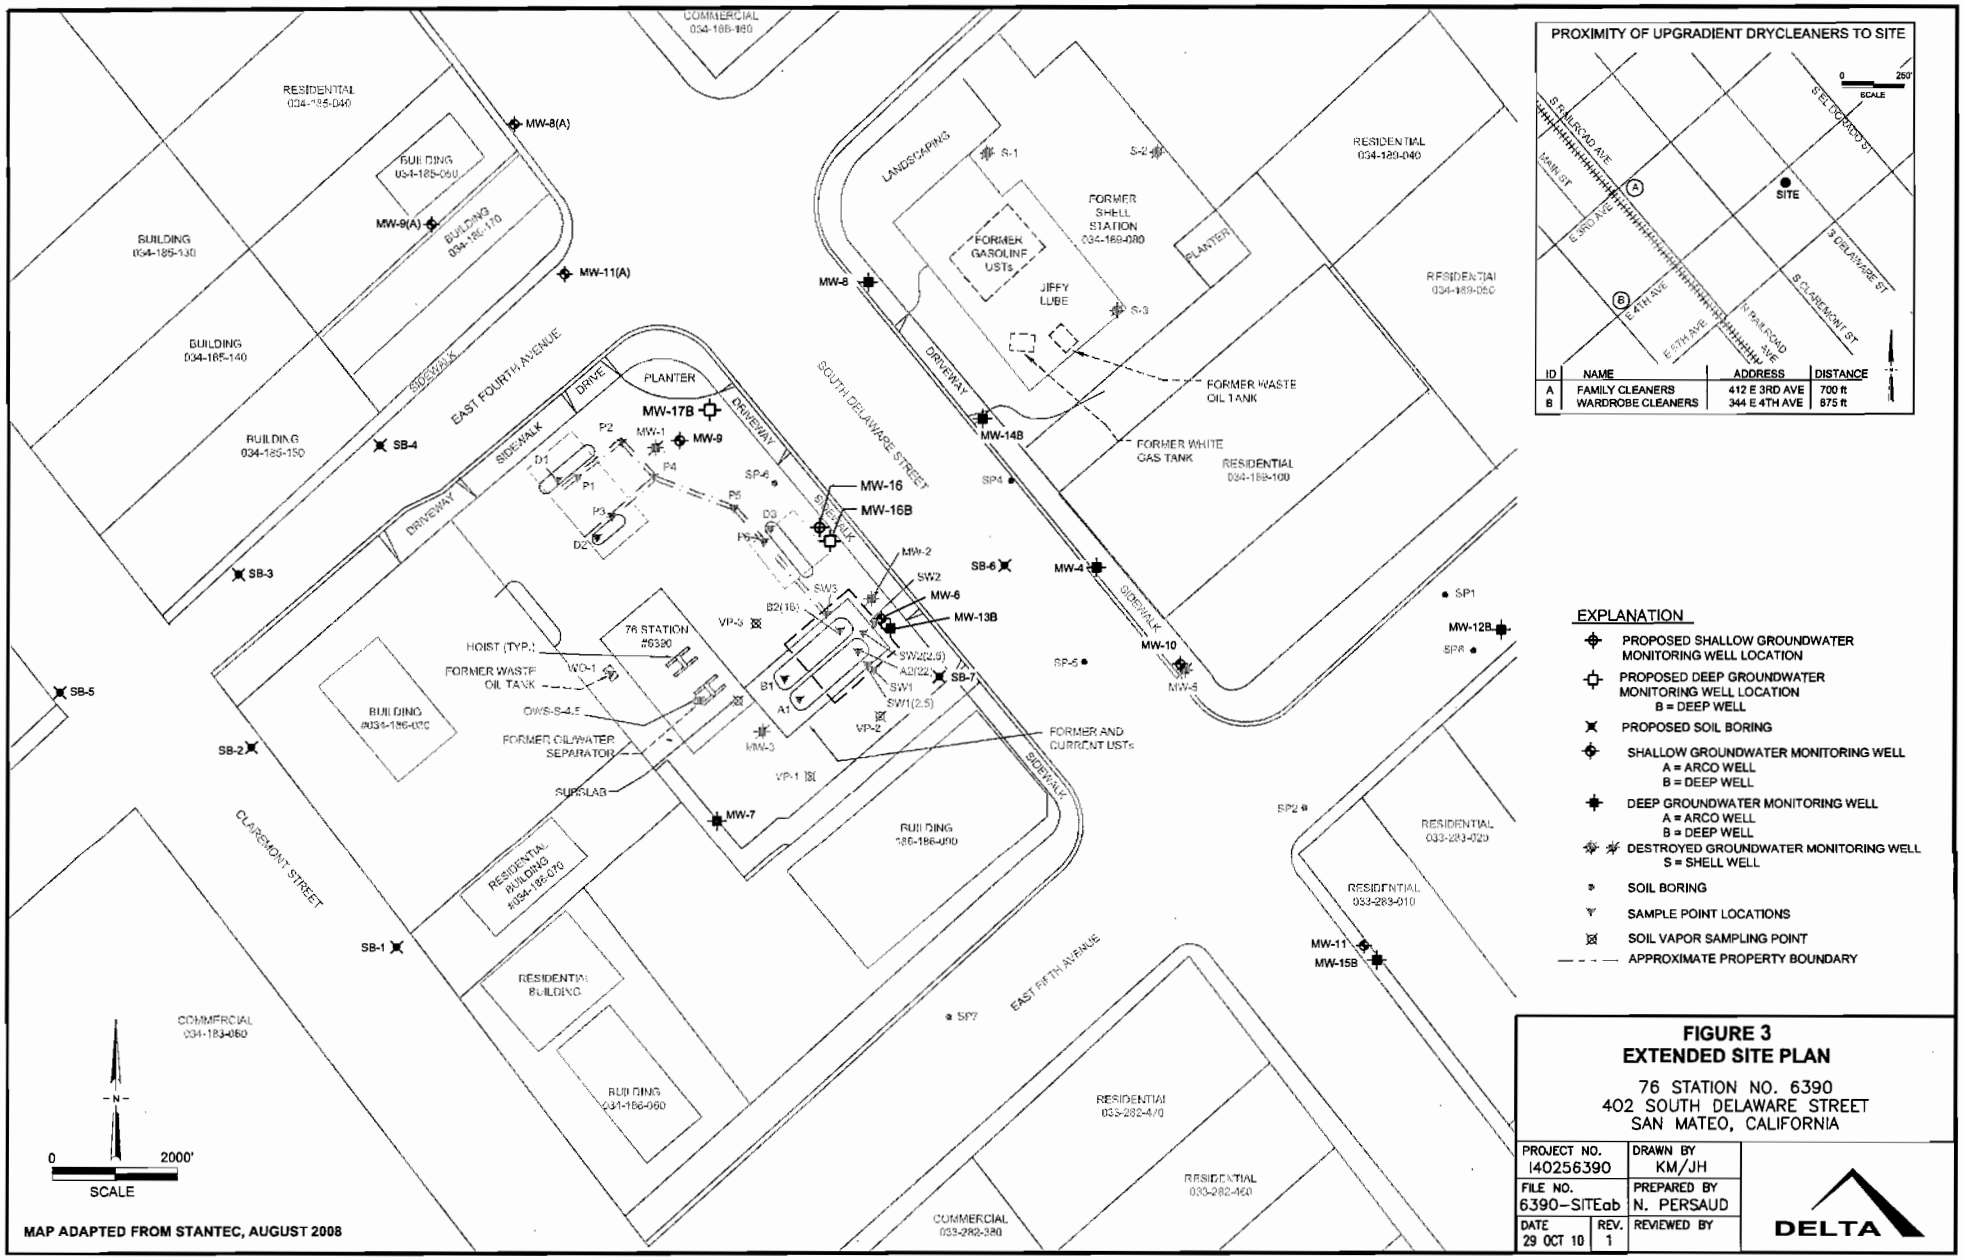
G. Permit is valid for mobilizations associated with originally permitted boring/monitoring well locations only, including contingency locations, and is automatically canceled if not exercised, or if an extension is not applied for and granted by County GPP, within 120 days of the original permit issuance date. Failure to notify staff of cancellation or delay in start time, at least one minute prior to the notified start time, will result in the Consultant being billed an Inspection Cancellation fee of $264 for 2011 if GPP staff attempted to perform an inspection.

H. Wells installed under this permit may not be used for domestic, municipal, commercial, or irrigation water supply.

I. All work plans and reports related to work performed under County oversight **must** conform to Business and Profession Codes and State Water Well Standards.

J. Top-of-casing elevation of all wells **must** be surveyed to the nearest 0.01-foot relative to Mean Sea Level (NAVD88) and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate. Geotechnical wells are exempt from this requirement if a written variance from GPP is obtained prior to drilling.

K. Latitude and longitude of all wells **must** be surveyed with sub-meter accuracy relative to NAD83 and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate.



L. Violation of any requirement or general or special permit condition may result in an order by GPP staff to cease work under this permit, correct the violation, and potentially re-permit the work as a new mobilization.

SAN MATEO COUNTY
ENVIRONMENTAL HEALTH
APR 18 2011
RECEIVED

April 15, 2011

Mr. Deno Milano
San Mateo County Environmental Health Services Division
2000 Alameda de las Pulgas, Suite 100
San Mateo, CA 94403

Subject: **Drilling Permit Application Packet for 76 Service Station #6390**
76 Service Station No. 6390
402 S. Delaware Avenue
San Mateo, CA

Dear Mr. Milano:

Enclosed with this letter are the drilling permit applications, fees (**Check #645640**) and site plan for the subject site and adjacent streets. A Letter of Intent approved by the City of San Mateo is also included to fulfill the signature requirement for boring locations in public right-of-ways. We are in the process of obtaining an access agreement on the adjacent property south of the subject site. Antea Group will submit another drilling permit application assuming access is granted for that location (SB-5). We are scheduled to begin this work on May 2, 2011. If you have any questions, please give me a call at 408-826-1874.

Sincerely,

Matt Corley
Staff Professional

Douglas Umland

Standard Field and Laboratory Operating Procedures

STANDARD OPERATING PROCEDURES

Utility Locating

Prior to drilling, boring and excavation locations and an approximate 15-foot by 15-foot box are marked with white paint or other distinct marking and cleared for underground utilities through Underground Service Alert (USA). In addition, Antea Group will contract an independent locator services to clear boring or excavation locations of subsurface assets. The first five feet (or more in instances where utilities are suspected in close proximity) of each borehole are air-knifed, or carefully advanced with a hand auger if shallow soil samples are necessary, to help evaluate the borehole location for underground structures or utilities in accordance with Antea Group's subsurface hazard avoidance policy.

Subsurface Investigation Methods – GeoProbe®, Sonic, Hollow Stem Auger Drilling, Sampling, and Borehole Completion

Borehole Advancement using GeoProbe® (Single wall and dual tube)

Pre-cleaned push rods (typically one to two inches in diameter) are advanced using a hydraulic direct push-type rig for the purpose of collecting samples and evaluating subsurface conditions. The sample barrel located at the leading end of the drill rod serves as a soil sampler, and an acetate liner is inserted into the sample barrel rod prior to advancement of the push rod. Once the sample is collected, the rods and sampler are retracted and the acetate sample tubes are removed from the sampler. The sample barrel is then cleaned, filled with clean sample tubes, inserted into the borehole and advanced to the next sampling point where the sample collection process is repeated. This process differs with the use of Dual Tube drilling, where an outer rod is pushed with the sample rod, and only the sample rod is retracted. This process assures that the borehole remains open during drilling, thereby minimizing cave-ins within the borehole.

Undisturbed soil samples selected for laboratory analysis are cut away from the acetate sample liner using a hacksaw, or equivalent tool, in sections approximately 6 inches in length. The 6 inch samples are lined at each end with Teflon® sheets and capped with plastic caps. Labels documenting project number, borehole identification, collection date, and depth are affixed to each sample. The samples are then placed into an ice-filled cooler for delivery under chain-of-custody to a laboratory certified by the State of California for analysis. The remaining collected soil that has not been selected for laboratory analysis is logged using the United Soil Classification System (USCS) under the direction of a State Registered Professional Geologist, and is field screened for organic vapors using a photo ionization detector (PID), or an equivalent tool. To collect a PID reading, A portion of each liner was placed in a gloss jar and sealed with a disposable tin foil top. After approximately ½-hour, the sampling tube of a PID was inserted into the jar through the foil top. The stabilized PID readings were recorded on the well boring logs

Borehole Advancement using Sonic Drilling

Pre-cleaned heavy-walled down-hole casings (typically 6 to 8 inches in diameter) are advanced using a sonic head. A smaller diameter core barrel (typically 4 to 6 inches in diameter) is advanced through the inside of the down-hole casings to remove the soil cuttings from the borehole for sample collection and evaluation of subsurface conditions.

During drilling, soil samples are collected continuously using the sonic core barrel. A physical description of soil

characteristics (i.e. moisture content, consistency or density, odor, color, and plasticity), drilling difficulty, and soil type as a function of depth are described on boring logs. The soil cuttings are classified in accordance with the USCS and field screened for organic vapors using a PID.

Borehole Advancement using Hollow Stem Auger

Pre-cleaned hollow stem augers (typically 8 to 10 inches in diameter) are advanced using a drill rig for the purpose of collecting samples and evaluating subsurface conditions. A pre-cleaned split spoon sampler is lined with three 6-inch long brass or stainless steel tubes and attached to the drill rods. The sampler is then driven 18 inches into the underlying soils at the target sample interval by repeatedly dropping a 140-pound hammer over a 30-inch free fall distance. The number of blow counts to drive the sampler each 6-inch interval of sampler advancement are recorded on the field logs. The sampler is driven 18 inches or until the sampler has met refusal (typically 50 blows per six inches), then the sampler is retrieved. Alternatively, soil samples are retrieved by driving the sampler using a pneumatic hammer, when using a limited access rig.

Generally the bottom sample tube is selected for laboratory analysis. The middle tube is extruded for logging and PID screening, and the top tube is considered slough caved off from the sides of the boring prior to sampling.

The retained sample is carefully packaged for chemical analysis by capping each end of the sample with a Teflon sheet followed by a tight-fitting plastic cap and stored in a zip-type plastic bag. A label is affixed to the sample indicating the sample identification number, borehole number, sampling depth, sample collection date, and job number. The sample is then annotated on a chain-of-custody form and placed in an ice-filled cooler for transport to the laboratory.

During the drilling process, a physical description of the encountered soil characteristics (i.e. moisture content, consistency or density, odor, color, and plasticity), drilling difficulty, and soil type as a function of depth are described on boring logs. The soil cuttings are classified in accordance with the USCS.

Grab Groundwater Sample Collection

Once the target groundwater sampling depth has been reached, a groundwater sample is collected by inserting a temporary 1-inch schedule 40 PVC casing with a 5-foot screened interval with a pre-attached filter pack into the borehole. The screened interval is placed from at the total depth of the boring. Groundwater is allowed to temporarily stabilize, and grab samples are collected using a peristaltic pump.

Collected water samples are decanted directly into laboratory provided, pre-cleaned, vials or containers and sealed with Teflon-lined septum, screw-on lids. Labels documenting sample number, well identification, collection date, and type of preservative (if applicable, i.e. HCl for GRO, BTEX, and fuel oxygenates) are affixed to each sample. The samples are then placed into an ice-filled cooler for delivery under chain-of-custody to a laboratory certified by the State of California to perform the specified tests.

Borehole Completion

Upon completion of drilling and sampling, the inner casing rods are retracted. Neat cement grout, mixed at a ratio of 6 gallons of water per 94 pounds of Portland cement, is introduced via a tremie pipe to displace standing water in the borehole, through the annulus of the outer casing rods. The outer rods are retracted as the grout is introduced to bottom of the boring to prevent the cross contamination of encountered water bearing zones. Displaced groundwater is collected at the surface and placed into DOT approved 55-gallon steel drums, or an equivalent storage container. In areas where the borehole penetrates asphalt or concrete, the borehole is capped with an equivalent thickness of asphalt or concrete patch to match finished grade.

Well Construction (typical)

Selected borings will be converted to groundwater monitoring wells by the installation of 2-inch diameter Schedule 40 polyvinyl chloride well casing with 0.020-inch factory slotted well screen as stated in the body of the work plan. A filter pack of Monterey #3 grade sand (or equivalent) will be placed in the annular space of the monitoring well borings, extending from the bottom of each well casing to approximately 1-foot above the top of the screened casing. A sanitary seal consisting of a 2-foot bentonite will be placed on above the filter sand and charged with water to create a seal. Neat cement grout, mixed at a ratio of 6 gallons of water per 94 pounds of Portland cement, is introduced via a tremie pipe to displace standing water in the well annulus bentonite to within two feet of the ground surface. Antea Group will install a minimum of a 5-foot annual seal. A traffic-rated well box will be installed on each well to protect and finish the well to surface grade.

Well Development

Groundwater monitoring wells will be allowed to stabilize for a minimum of 72 hours after installation prior to development. During development, wells are surged and purged of approximately 10 casing volumes. After each purged volume (or other stated purge volume) measurements of pH, temperature, electric conductivity (E.C.), turbidity, dissolved oxygen (DO) and total dissolved solids (TDS) are recorded. Following development, the wells will be allowed stabilize for a minimum of 48 hours prior to the collection of any groundwater samples.

Well Gauging

Wells are inspected prior to evacuation and sampling. The condition of the wellhead is checked and noted according to a wellhead inspection checklist. Standard measurements include the depth to water (DTW) and the total well depth (TD) obtained with industry standard electronic sounders which are graduated in increments of hundredths of a foot. The water in each well is inspected for the presence of Immiscibles or sheen and when free product is suspected, it is confirmed using an electronic interface probe (e.g. MMC). No samples are collected from a well containing free product.

Well Purging

Depth to water measurements are collected prior to purging and minimum purge volumes are calculated anew for each well based on the height of the water column and the diameter of the well. Expected purge volumes are never less than three case volumes and are set at no less than four case volumes in some jurisdictions. Well purging devices are selected on the basis of the well diameter and the total volume to be evacuated. In most cases the well will be purged using an

electric submersible pump (i.e. Grundfos) suspended near (but not touching) the bottom of the well. Small volumes of purgewater are often removed by hand bailing with a disposable bailer.

Well purging completion standards include minimum purge volumes, but additionally require stabilization of specific groundwater parameters prior to sample collection. Typical groundwater parameters used to measure stability are electrical conductivity, pH, and temperature. Instrument readings are obtained at regular intervals during the evacuation process (no less than once per case volume). Stabilization standards for routine quarterly monitoring of fuel sites include the following: Temperature is considered to have stabilized when successive readings do not fluctuate more than +/- 1 degree Celsius. Electrical conductivity is considered stable when successive readings are within 10%. pH is considered to be stable when successive readings remain constant or vary no more than 0.2 of a pH unit.

Prior to sampling, wells are left to recharge to at least 80% the initial water column height. Groundwater samples are collected with a disposable bailer.

Equipment Decontamination

Equipment that could potentially come in contact subsurface media and compromise the integrity of the samples is carefully decontaminated prior to drilling and sampling. Drilling auger and other large pieces of equipment are decontaminated using high pressure hot water spray. Soil and groundwater sampling apparatus, groundwater pumps, liners and other equipment are decontaminated in an Alconox scrub solution and double rinsed in clean tap water rinse followed by a final distilled water rinse.

The rinsate and other wastewater are contained in 55-gallon DOT-approved drums, labeled (to identify the contents, generation date and project) and stored on-site pending waste profiling and disposal.

Waste Handling and Disposal *(Soil Cuttings and Rinsate/Purge Water)*

Soil cuttings and rinsate/purge water generated during drilling and sampling are stored on-site in DOT-approved 55-gallon steel drums pending characterization. A label is affixed to the drums indicating the contents of the drum, suspected contaminants, date of generation, and the boring number from which the waste is generated. The drums are removed from the site by a licensed waste disposal contractor to an appropriate facility for treatment/recycling.

Re: **76 Service Station No. 6390, 402 South Delaware Street, San Mateo, California;** Antea Project No.140256390, MCE Job No. 08119X

Dear Mr. Chantikian,

As you requested, on June 6 we surveyed one new monitoring well located at the referenced site. Our findings are shown on the attached sheets, expressed in State Plane Coordinates and Latitude/Longitude, and are consistent with our previous survey of August 18, 2008 for Stantec.

A notch was cut in the north rim of the PVC casing (TOC) and a cross chiseled in the north rim of the standard box (TOB).

Measurements were obtained from conventional survey techniques in combination with GPS techniques (Code CGPS), using data for MW-4 TOC and MW-7 TOC reported to GeoTracker from surveys by Morrow Surveying dated 8/13/2005 and 12/19/2006.

The benchmark used for this survey is the TOC of MW-7 as described above and reported by Morrow Surveying. Elevation = 21.74 feet, reported to be NAVD 88 datum.

Please let me know if you have questions or need additional information.

Yours truly,

Lee D. Vaage

QUALIFIERS

Project: 256390
Pace Project No.: 257793

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel Clean-Up

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

LABORATORIES

PASI-S	Pace Analytical Services - Seattle

BATCH QUALIFIERS

Batch: MSV/4588

[M5]	A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.

ANALYTE QUALIFIERS

L3	Analyte recovery in the laboratory control sample (LCS) exceeded QC limits. Analyte presence below reporting limits in associated samples. Results unaffected by high bias.
M0	Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.
M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
R1	RPD value was outside control limits.

Antea Group Lab Validation Sheet

Project/Client: I40256390/ CoP ELT

Project #: I40256390

Date of Validation: 7/7/2011 **Date of Analysis:** 5/28-6/1/2011

Sample Date: 5/19/2011 **Completed By:** Nadine Periat

Signature: 

Circle or Highlight **Yes / No** (below)

Analytical Lab Used and Report # Pace Analytical No. 257793

1.	Was the analysis the one requested?	**Yes** / No
2.	Do the sample number(s) on the chain-of-custody (COC) match the one(s) that appear on the laboratory data sheet?	**Yes** / No
3.	Were samples prepared (extracted, filtered, etc.) within EPA holding times?	**Yes** / No
4.	Once prepared/extracted, were the samples analyzed within the EPA holding times?	**Yes** / No
5.	Were Laboratory blanks performed, if so, were they below non-detect?	**Yes** / No
6.	Are the units correct? (i.e., soil samples in mg/kg or ug/g, water samples mg/L, ug/L, and air samples in volume mg/m^3,etc.)	**Yes** / No
7.	Were appropriate Matrix Spike (MS) and Matrix Spike Duplicate (MSD) samples included in the laboratory batch sample?	Yes / **No**
8.	In lieu of MS/ MSD, were surrogate spike (SS) or surrogate spike duplicate (SSD) samples included in the laboratory batch samples?	Yes / **No**
9.	Were MS/ MSD (or SS/SSD) within the acceptable range of % recovery (i.e., approx 80-120% depending on analyte)?	Yes / **No**
10.	Were MS/MSD (or SS/SSD) values used to calculate Relative Percent Difference (RPD)?	**Yes** / No
11.	Were Relative Percent Difference values within the acceptable range (i.e. ±25%)?	Yes / **No**

If any answer is no, explain why and what corrective action was taken:

7. No MS/MSD were run on the QC batch for GRO due to a low sample volume. The absence of a MS/MSD does not affect the sample result.
8. Laboratory Control Samples were run in lieu of MS/MSDs
9. MS/MSD recovery was outside laboratory control limits. This was noted for 1,2-Dichloroethane and Ethanol analyses. MS recovery was outside QC limits for EDB, 1,2-Dichloroethene (total), chloroform, MTBE, TAME, TBA, PCE and TCE.
11. RPD was outside control limits on the lead QC sample.

RE: Project: 256390
Pace Project No.: 257794

Dear Doug Umland:
Enclosed are the analytical results for sample(s) received by the laboratory between May 21, 2011 and May 24, 2011. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Regina SteMarie

QUALIFIERS

Project: 256390
Pace Project No.: 257794

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel Clean-Up

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

LABORATORIES

PASI-S	Pace Analytical Services - Seattle

BATCH QUALIFIERS

Batch: MSV/4588

[M5]	A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.

ANALYTE QUALIFIERS

C0	Result confirmed by second analysis.
D6	The relative percent difference (RPD) between the sample and sample duplicate exceeded laboratory control limits.
L2	Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results for this analyte in associated samples may be biased low.
L3	Analyte recovery in the laboratory control sample (LCS) exceeded QC limits. Analyte presence below reporting limits in associated samples. Results unaffected by high bias.
M0	Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.
M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
S5	Surrogate recovery outside control limits due to matrix interferences (not confirmed by re-analysis).

Comments/ Resolution:

SB-7@10 and SB-7@15 received separately from the rest of the samples. RSM

Project Manager Review: RSM Date: 05/24/11

Note: Whenever there is a discrepancy affecting North Carolina compliance samples, a copy of this form will be sent to the North Carolina DEHNR Certification Office (i.e. out of hold, incorrect preservative, out of temp, incorrect containers)

Is the Data Valid? (circle) Yes	Preservation Temperature (if Known): 0.4, 3.4, 4.8 °C

Lab Validation Sheet

Project/Client: ___ELT_____
Project #: ___I40256390 - 0001__
Date of Validation: 6/28/2011 **Date of Analysis:** 5/25-6/1/2011 **Sample Date:** 5/17-5/19/2011
Completed By: Evan Chantikian **Signature:** Evan Chantikian
Analytical Lab Used and Report # (if any): _PACE - 257794_

	Circle or Highlight Yes/No below
1. Was the analysis the one requested?	Yes
2. Do the sample number(s) on the chain-of-custody (COC) match the one(s) that appear on the laboratory data sheet?	Yes
3. Were samples prepared (extracted, filtered, etc.) within EPA holding times?	Yes
4. Once prepared/extracted, were the samples analyzed within the EPA holding times?	Yes
5. Were Laboratory blanks performed, if so, were they below non-detect?	Yes
6. Are the units correct? (i.e., soil samples in mg/kg or ug/g, water samples mg/L, ug/L, and air samples in volume mg/m^3,etc.)	Yes
7. Were appropriate Matrix Spike (MS) and Matrix Spike Duplicate (MSD) samples included in the laboratory batch sample?	Yes
8. In lieu of MS/ MSD, were surrogate spike (SS) or surrogate spike duplicate (SSD) samples included in the laboratory batch samples?	NA
9. Were MS/ MSD (or SS/SSD) within the acceptable range of % recovery (i.e., approx 80-120% depending on analyte)? Multiple MS/MSD sample pairs exceeded acceptable recover range. The data was accepted based on laboratory control samples.	No
10. Were MS/MSD (or SS/SSD) values used to calculate Relative Percent Difference (RPD)?	Yes
11. Were Relative Percent Difference values within the acceptable range (i.e. ± 25%)? Noted by data qualifier D6, the RPD was 49 for TBA in the MS/MSD 72635/72636	No

If any answer is no, explain why and what corrective action was taken:

RE: Project: 256390
Pace Project No.: 258039

Dear Doug Umland:
Enclosed are the analytical results for sample(s) received by the laboratory on June 09, 2011. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Regina SteMarie

QUALIFIERS

Project: 256390
Pace Project No.: 258039

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel Clean-Up

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

LABORATORIES

PASI-S	Pace Analytical Services - Seattle

ANALYTE QUALIFIERS

M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
S2	Surrogate recovery outside laboratory control limits due to matrix interferences (confirmed by similar results from sample re-analysis).

Project Manager Review: RSM Date: 06/09/11

Note: Whenever there is a discrepancy affecting North Carolina compliance samples, a copy of this form will be sent to the North Carolina DEHNR Certification Office (i.e out of hold, incorrect preservative, out of temp, incorrect containers)

Is the Data Valid? (circle) Yes	Preservation Temperature (if Known): 2.3 °C

Lab Validation Sheet

Project/Client: ___ELT_____
Project #: ___I40256390 - 0001__
Date of Validation: 6/28/2011 **Date of Analysis:** 6/16,6/20/2011 **Sample Date:** 6/7/2011
Completed By: Evan Chantikian **Signature:**
Analytical Lab Used and Report # (if any): _PACE - 258039_

	Circle or Highlight Yes/No below
1. Was the analysis the one requested?	Yes
2. Do the sample number(s) on the chain-of-custody (COC) match the one(s) that appear on the laboratory data sheet?	Yes
3. Were samples prepared (extracted, filtered, etc.) within EPA holding times?	Yes
4. Once prepared/extracted, were the samples analyzed within the EPA holding times?	Yes
5. Were Laboratory blanks performed, if so, were they below non-detect?	Yes
6. Are the units correct? (i.e., soil samples in mg/kg or ug/g, water samples mg/L, ug/L, and air samples in volume mg/m^3,etc.)	Yes
7. Were appropriate Matrix Spike (MS) and Matrix Spike Duplicate (MSD) samples included in the laboratory batch sample?	Yes
8. In lieu of MS/ MSD, were surrogate spike (SS) or surrogate spike duplicate (SSD) samples included in the laboratory batch samples?	NA
9. Were MS/ MSD (or SS/SSD) within the acceptable range of % recovery (i.e., approx 80-120% depending on analyte)? Multiple MS/MSD sample pairs exceeded acceptable recover range. The data was accepted based on laboratory control samples.	No
10. Were MS/MSD (or SS/SSD) values used to calculate Relative Percent Difference (RPD)?	Yes
11. Were Relative Percent Difference values within the acceptable range (i.e. ± 25%)?	Yes

If any answer is no, explain why and what corrective action was taken:

Additional Site Investigation Report

76 Service Station No. 6390
402 South Delaware Street, San Mateo, CA

1.0 INTRODUCTION

Antea™Group has prepared this *Additional Site Investigation Report* to report on the further evaluation of tetrachloroethylene (PCE, perchloroethylene) and petroleum hydrocarbons in groundwater at and adjacent to the 76 Service Station No. 6390, located at 402 Delaware Street, San Mateo, California (**Figure 1**). This report outlines the results of work conducted as follow-up to a San Mateo County Groundwater Protection Program (GPP) letter dated November 22, 2011, which is provided along with all subsequent correspondence and permits in **Appendix A**. Antea Group performed this investigation to: 1) further assess the possible origin of PCE typically detected in groundwater monitoring wells on and downgradient of the site, and 2) further define the lateral extent of residual hydrocarbons in saturated zone soils and groundwater approximately 15 feet northeast and east of the existing underground storage tank (UST) cavity, as well as along the east side of South Delaware Street.

1.1 Site Location and Setting

The site is currently occupied by an active 76 Service Station, located on the south corner at the intersection of East Fourth Avenue and South Delaware Street in San Mateo, California. The station is located approximately one mile west of San Francisco Bay at an elevation of approximately 20 feet above mean sea level (**Figure 1**). The site facilities currently include two fuel USTs located in a common pit in the southeast portion of the property, three product dispenser islands, and a station building (**Figure 2**). The site is located on an alluvial plain extending from the Santa Cruz Mountains to the east to the San Francisco Bay within the Santa Clara Valley groundwater basin and South Bay hydrologic planning area. A complete summary of the site location, history, and setting is presented in **Appendix B**.

1.2 Potential Sources of PCE

Antea Group's 2011 *Potential Tetrachloroethylene (PCE) Source Evaluation Report* summarized past and recent research into the potential source(s) of PCE contamination in groundwater, which includes several former dry cleaners and other leaking tank sites in the general vicinity and upgradient of the subject property. The results of the 2011 investigation indicate a source of PCE likely exists upgradient of the site and that PCE is present in groundwater regionally, but the investigation results did fully not rule out the subject site as a contributor. Per GPP's November 2011 letter, Antea Group conducted additional PCE testing both on and off-site to further evaluate whether the former waste oil UST at the site caused a release of PCE into soil or groundwater.

1.2.1 On-Site

The only potential onsite source of PCE identified in 2009 was a waste oil tank removed in 1992 in which two holes were observed (KEI 1992). In the one soil sample (WO-1) collected beneath the tank, PCE was reported at a

concentration of 0.0064 milligrams per kilogram (mg/kg). PCE was not detected in a soil sample collected during removal of an oil-water separator in 1996, so that feature is not considered a likely source of PCE contamination.

1.2.2 Off-Site

A parcel search was performed in 2008 by Stantec and a Sanborn insurance map search was performed by Delta Consultants (now Antea Group) in 2009 to identify any former businesses or property uses which may have contributed to a PCE release (Stantec 2008, Delta 2009). The following summarizes the results of those searches:

- The subject site has operated as a gasoline service station since 1972. Prior to this time, the property was residential.
- The property at 500 East 4th Avenue (parcel #034-186-080, immediately up-gradient and adjacent to the site) was identified as a gasoline service station in insurance maps from 1953 to 1969. Prior to this the land was a lumberyard, and currently the property is a Taco Bell restaurant and parking lot.
- Fourteen current or former dry cleaners were identified within a half mile upgradient (west) of the site. Three of the dry cleaners have active GPP cases related to the release of PCE. **Figure 3** shows the relative locations of some of the nearby dry cleaners.
- Seven gasoline service stations were identified within a quarter mile of the site, two of which were identified to be upgradient of the site.

As part of the 2011 *Potential Tetrachloroethylene (PCE) Source Evaluation Report*, Antea Group continued to research possible offsite sources of PCE. Antea Group found that there is an open assessment LUST cleanup site located west of the site (T. Endo Automotive, GPP Case No. 110008). Monitoring well MW-2 associated with that case is located approximately 100 feet west of off-site soil boring SB-1, or in the general up-gradient direction of the subject site (**Figure 2**). The nearby well is not typically monitored for HVOCs, including PCE, but during four sampling events between September 2010 and September 2011 the analysis of TPH-G was flagged as "Atypical pattern: Gasoline value due to chlorinated compounds" by the laboratory. During the September and December 2010 sampling events, PCE in MW-2 was estimated at concentrations of 18.6 µg/L and 25.5 µg/L, respectively (Atlas Engineering Services Inc., 2011).

2.0 SCOPE OF WORK

The scope of work implemented in the current investigation consisted of two phases for additional source evaluation and delineation of PCE and petroleum hydrocarbons at both on and off-site locations. The scope of work was based on comments made in the November 2011 GPP letter and subsequent email correspondence (**Appendix A)**. Antea Group implemented the scope of work in two phases due to delays in obtaining permits for onsite work.

The first phase (off-site work) was the advancement of off-site soil boring SB-9, the installation of off-site temporary well TW-1, the destruction of off-site monitoring well MW-10, and the installation of off-site monitoring wells MW-10R and MW-19.

- Soil boring SB-9 was advanced to assess fuel hydrocarbons in first-encountered groundwater immediately east of the fuel UST cavity. Previous groundwater sampling in SB-6 assessed groundwater from a deeper zone, not accurately reflecting hydrocarbons in first-encountered groundwater.
- Temporary well TW-1 was installed within five feet of SB-5 (immediately upgradient of the former waste oil UST) to collect grab groundwater samples to assess hydrocarbons and PCE in first-encountered groundwater and groundwater in the deeper zone (same depth monitored by MW-13B).
- Monitoring well MW-10 was destroyed and replaced with monitoring well MW-10R. MW-10 was screened too shallow, and no groundwater samples had been collected from it since it was installed in 2008.
- Monitoring well MW-19 was installed immediately south-southeast of MW-4 to assess first groundwater near MW-4. GPP expressed concern for MW-4 being screened too deeply to accurately assess first groundwater (i.e., dilution caused by excessive screen in the saturated zone).

The second phase (on-site work) involved the advancement of soil boring SB-8 and the installation of monitoring well MW-18.

- Soil boring SB-8 was advanced immediately east of the former waste oil tank to collect grab groundwater samples to assess hydrocarbons and PCE in first-encountered groundwater and groundwater in the deeper zone (same depth monitored by MW-13B).
- In the November 2011 letter, the GPP requested to install a monitoring well to assess first groundwater immediately southeast of SB-7, with subsequent correspondence recommending that the well be placed on the site, between SB-7 and the neighboring commercial building (parcel #186-186-090). Due to access limitations, including an underground electrical line and tire storage units, Antea Group placed monitoring well MW-18 about 12 feet south-southwest of SB-7.

Figure 2 shows the locations of SB-9, TW-1, MW-10R, MW-19, SB-8, and MW-18. **Table 1** includes the soil boring and well construction details for the new and pre-existing subsurface testing locations.

3.0 SOIL BORING AND MONITORING WELL INSTALLATION AND DESTRUCTION

3.1 Pre Field Activities

Prior to initiation of field activities, Antea Group produced a Health and Safety Plan (HASP) in accordance with Title 8, Section 5192 of the California Code of Regulations. The HASP was reviewed daily by field personnel. Antea Group obtained all necessary subsurface drilling permits from the GPP (**Appendix A**). Additionally, Antea Group obtained an encroachment permit from the City of San Mateo for working on the 400 block of South Delaware

Street (**Appendix A**). Antea Group pre-marked the site and drilling locations, opened Underground Service Alert (USA) ticket numbers 109363, 109371, and 163584, and employed a private locator to clear each drilling location for subsurface obstructions and hazards. Borehole clearance activities were carried out as outlined in Antea Group's Standard Operating Procedures presented as **Appendix C,** including air-knifing to five feet below the ground surface (bgs). Prior to its destruction, MW-10 was air-knife cleared to five feet bgs around the annular seal of the well.

3.2 Soil Borings and Soil Sampling

Subcontractor Woodward Drilling (Woodward) advanced soil borings SB-8 and SB-9 and temporary well TW-1 and monitoring wells MW-10R, MW-18, and MW-19 under the supervision of Antea Group personnel on April 10-12, 2012 (TW-1, SB-9, MW-10R, MW-19), and May 16, 2012 (SB-8, MW-18). An Antea Group geologist oversaw advancement of the soil borings using dual-tube direct push drilling methods to depths of 17 to 30 feet bgs (**Table 1**), continuously logging soils along the way. The geologist screened soil for volatile organic compounds (VOCs) using a Photoionization Detector (PID) outfitted with a 10.6 eV bulb that is capable of detecting PCE. PID readings were recorded and are listed on soil boring logs presented in **Appendix D**. Soil samples were collected using Geoprobe® sampling rods with disposable 5-foot acetate liners. The geologist collected and preserved soil for potential laboratory analyses at intervals immediately above first groundwater, immediately below first groundwater, at depths with high PID readings, and at the bottom of the waste oil UST cavity between eight and nine feet bgs at SB-8. Ultimately, Antea Group requested laboratory analyses from eight soil samples (four from SB-8, two from MW-18, and one each from MW-10 and MW-19).

Samples that were chosen for laboratory submittal were submitted to Kiff Analytical (Kiff), a California certified analytical laboratory (No. 08263CA), and analyzed for the following constituents:

- Total petroleum hydrocarbons – gasoline range organics (TPH-GRO), carbon chain range C_{05} – C_{12}, by EPA Method 8260B;
- The full list of volatile organic compounds (VOCs) by EPA Method 8260, including:
    - Benzene, toluene, ethylbenzene, total xylenes (collectively BTEX) and methyl tertiary butyl ether (MTBE),
    - Total 1,2 dichloroethene (1,2-DCE), PCE, trichloroethylene (TCE), chloroform, and vinyl chloride.

3.3 Grab Groundwater Sampling

Antea Group and subcontractors collected grab groundwater samples from TW-1, SB-8, and SB-9 following boring advancement via a temporary 1-inch schedule 40 PVC casing with a 5-foot pre-pack filter screen attached and placed at the bottom of each boring. All grab groundwater samples collected were submitted to Kiff and analyzed for the same analytes as listed for soil samples in **Section 3.2**.

3.3.1 TW-1

In an effort to sample groundwater from the shallow zone (the upper 20'), drillers initially advanced temporary well TW-1 to a depth of 16 feet bgs (just below the depth to water in nearby wells), at which depth the drilling crew lifted the risers one foot to 15 feet bgs and attempted to collect a groundwater sample. After waiting 10 minutes, no groundwater had entered into the boring, so the crew advanced the boring to 20 feet bgs and set the temporary well screen at 15 to 20 feet bgs. The field geologist noted no evidence of groundwater or wet soils in the upper 20 feet at TW-1. To sample groundwater from the deeper zone (for PCE delineation), drillers completed a second borehole next to the shallow temporary well casing, this one to a depth of 27 feet bgs (where the probe encountered refusal). Drillers left the outer rods in place and set a second temporary well screen at 22 to 27 feet bgs, to straddle the midpoint of the screened zone at MW-13B (screened 22 to 31'), where PCE concentrations on the site are typically the greatest. Some 3.5 hours after setting the deeper temporary well casing, no groundwater had collected in either temporary well casing, so the drillers covered the borings with a plastic liner and cold patch asphalt and left it overnight. The next morning (April 11, 2012), groundwater had collected in only the deeper temporary well casing, with a static water level at 15.46 feet below grade. The field crew collected a grab groundwater sample from the deeper temporary well casing using a disposable bailer. Following sample collection, drillers removed the temporary casings and properly abandoned the temporary well location using tremie grout, per GPP requirements.

3.3.2 SB-8

The methodology to collect grab groundwater from soil boring SB-8 was similar to TW-1, except that only one hole was drilled and the shallow (upper 20-foot) casing was not allowed to sit overnight. Drillers initially advanced SB-8 to 20 feet bgs, at which depth the drilling crew lifted the risers one foot to 19 feet bgs and attempted to collect a groundwater sample (again, there were no signs of groundwater in the upper 20 feet). After 45 minutes, no groundwater had entered into the boring, so the crew continued advancement of the boring to 28 feet bgs. The boring then collapsed to 24.5 feet bgs and the crew installed a temporary well casing with a temporary well screen at 19.5 to 24.5 feet bgs. The boring was covered with a plastic liner and five hours after installing the temporary well casing, no groundwater had collected. Drillers then removed the temporary well casing and advanced the boring to 30 feet bgs, setting a new temporary well casing and pre-pack filter screen at 25 to 30 feet bgs. The boring was again covered with a plastic liner and cold patch asphalt and left overnight. The next morning (May 17, 2012), groundwater had collected in the temporary well casing, with a static water level measured at 14.50 feet below grade, or some 10 feet higher than the top of the temporary screen interval. Drillers collected a grab groundwater sample using a disposable bailer.

3.3.3 SB-9

Drillers advanced soil boring SB-9 to a depth of 17 feet after the geologist noted first signs of groundwater at a depth of 13.6 feet bgs. The drillers installed a temporary pre-packed filter screen between 12 and 17 feet, and after waiting over an hour, water had raised to 15.8 feet bgs, at which time a sample was collected using a disposable bailer. No deeper water samples were required from this location.

3.4 Monitoring Well Destruction

Woodward destroyed monitoring well MW-10 under the supervision of Antea Group personnel on April 10, 2012 by over drilling to the original well to its total boring depth of 17.5 feet bgs using 8-inch diameter hollow stem auger flights. The borehole was backfilled with Portland cement per GPP guidelines and the entire sidewalk flag above the location was replaced per city protocol, as requested by City of San Mateo Department of Public Works inspector, Mark Hathaway.

3.5 Monitoring Well Installation

Woodward installed new monitoring wells MW-10R, MW-18, and MW-19 under the supervision of Antea Group personnel on April 11, 2012 (MW-19), April 12, 2012 (MW-10R), and May 16, 2012 (MW-18). At each monitoring well location, borings were initially advanced for soil characterization purposes using a direct-push rig, each to a depth of 21 feet bgs, following air-knife clearance of each boring to five feet bgs. Drillers then over drilled each boring using eight-inch diameter hollow stem auger flights to depths of 21 feet bgs for the monitoring well installations. Each monitoring well was constructed using 15 feet of 0.020-inch slot PVC screen placed from six to 21 feet bgs, along with a #3 sand filter pack, 2-foot bentonite seal, and cement grout seal. All wells were secured with a locking well cap and securable well vault, concreted in place. Well construction details are denoted on the boring logs presented in **Appendix D** and in **Table 1**.

3.6 Monitoring Well Development

Under the supervision of Antea Group personnel, Woodward developed new monitoring wells MW-10R, MW-18, and MW-19 on May 17, 2012 by pumping a minimum 10 well casing volumes from the well, or until groundwater parameters stabilized. Prior to development, Antea Group ensured that the newest well (MW-18, installed one day prior) had reached its static water level. In total, approximately 100 gallons of water were purged from these three wells. Well development logs are included in **Appendix E**.

3.7 Monitoring Well Survey

Licensed surveyor Mid Coast Engineers surveyed the new soil borings and monitoring wells (SB-8, SB-9, MW-10R, MW-18, and MW-19) along with previously un-surveyed soil borings SB-5 through SB-7 on May 27, 2012. Longitude and latitude were surveyed to North American Datum 83. The top of casing well elevations were surveyed to North American Vertical Datum 88. The survey data have been included as **Appendix F.** As required by the State of California Water Resources Control Board, the survey information was also uploaded to GeoTracker in June 2012.

3.8 Monitoring Well Sampling

On May 30, 2012, new monitoring wells MW-10R, MW-18, and MW-19 were gauged and sampled for the first time by subcontractor Blaine Tech Services (Blaine Tech). In addition, Antea Group directed Blaine Tech to gauge and sample the following existing wells: MW-4, MW-6, MW-7, MW-11, MW-13B, and MW-14B. One well (MW-9) was

dry and could not be sampled, whereas only a grab (no-purge) sample could be collected from MW-11. Blaine Tech purged and sampled each well using low-flow sampling techniques with an electric submersible pump and dedicated tubing. Groundwater samples were submitted to Pace Analytical Laboratories (Pace) and analyzed for the same analytes as listed for soil samples in **Section 3.2**. Blaine Tech's groundwater sampling field data sheets are presented as **Appendix G**.

3.9 Disposal of Investigation Derived Waste

Antea Group's waste management contractor Belshire Environmental Services, Inc. removed four drums of soil on May 4, 2012, and two drums of soil on May 30, 2012. The six total drums of soil were transported to Soil Safe in Adelanto, California in two separate shipments on June 4 and June 18, 2012, and two well development water drums were disposed at Demenno Kerdoon in Compton, California on June 06, 2012. Non Hazardous Waste Manifests for soil and groundwater generated during the investigation are presented as **Appendix H.**

4.0 INVESTIGATION RESULTS

4.1 Subsurface Conditions

Soils beneath the site consisted primarily of sands with varying amounts of clay and silt and clays with varying amounts of sand to the total depth explored of 30 feet bgs. Groundwater was encountered in the borings at depths ranging from 13.6 feet bgs (SB-9) to 19.75 feet bgs (MW-19). In general, reported subsurface conditions were similar to those previously reported and depicted on cross-sections included in the July 2011 *Potential Tetrachloroethylene (PCE) Source Evaluation Report*.

With respect to groundwater, a shallow groundwater zone (i.e., groundwater in the upper 20 feet bgs) that is present near the USTs and downgradient of the site (demonstrated by water in MW-6, MW-10R, MW-18, MW-19, and periodically in shallower wells MW-9 and MW-11), is not continuous along the western boundary of the site, indicating locally semi-confined conditions in the eastern portion of the site. Antea Group set a screened interval in TW-1 from 15 to 20 feet bgs, but after leaving it overnight, no water was present. In SB-8, grab water sampling was attempted from 19 to 20 feet bgs, and from a screened interval left in place from 19.5 to 24.5 feet bgs. After several hours and no signs of water, the screen was removed and the boring was advanced to 30 feet bgs. In both TW-1 and SB-8, which had temporary screened intervals from 25 to 30' bgs, the water levels rose to 15.46 feet in TW-1, and to 14.50 feet in SB-8, after leaving each overnight.

4.2 Soil Screening Results

Soil screening results from PID readings varied from boring to boring and at depth. Field personnel observed only low-level PID readings in soil from borings MW-10R and SB-8 with the highest PID reading being 12.9 parts per million (ppm) in MW-10R at 20.5 feet bgs, and only 1.3 ppm in SB-8 at 23 feet bgs. Antea Group did not record PID readings in soil from TW-1 and SB-9 due to their proximity to SB-5 and SB-6, respectively, where extensive soil screening and sampling occurred in 2011.

PID readings were higher in MW-19, with background levels recorded from five to 17 feet bgs and elevated levels beginning at the water table around 17 feet bgs. In saturated soils at MW-19, PID readings ranged from 28.5 ppm at 20 feet to 638 ppm at 18 feet bgs. PID readings were the highest at MW-18, with elevated levels ranging from 559 at 20.5 feet bgs to 10,000+ at 19 feet bgs. The boring logs in **Appendix D** list all recorded PID readings.

4.3 Soil Analytical Results

Antea Group field personnel collected a total of eight soil samples from SB-8, MW-10R, MW-18, and MW-19. Soil sample analytical results are summarized in **Table 2** and shown on **Figure 4**. Certified laboratory analytical reports are included in **Appendix I**.

4.3.1 PCE Distribution in Soil

One focus of soil analyses in this investigation was to determine if contaminated soil was present beneath the former waste oil tank located on the subject site. Antea Group submitted four soil samples from SB-8 for laboratory analysis of GRO and VOCs (depths of 9.0, 17.5, 23.5, and 27.5 feet bgs). The sample depth of 9.0 feet bgs is just below that of the sample collected in 1992 during waste oil UST removal (sample WO1). In SB-8, only trace levels of PCE were reported in soil at 23.5 feet bgs (0.012 mg/kg) and at 27.5 feet bgs (0.013 mg/kg). Those sample depths are at or just beneath the groundwater table, thus PCE concentrations are indicative of the low levels present in groundwater at and up-gradient of the site. The absence of elevated PID readings, PCE, and all other contaminants of concern in soils beneath the former waste oil tank support the conclusion that that UST was not a source of contamination at the site.

PCE was not detected in soil samples collected from MW-10R, MW-18, and MW-19. However, previous investigations have reported similar, low levels of PCE in soils near the groundwater table at locations away from the former waste oil UST (i.e., MW-17B and SB-4 through SB-7), as shown in **Table 2**. These widespread, low levels of PCE in saturated soils are indicative of the regional PCE plume in groundwater.

4.3.2 Hydrocarbon Distribution in Soil

In order to further evaluate hydrocarbon impacts in the smear zone, Antea Group requested analyses from deeper soil samples from MW-10R (18.5 feet bgs), MW-18 (15.5 and 19.5 feet bgs) and MW-19 (18.0 feet bgs). By far, the most significantly impacted soil is at MW-18, where GRO was reported at 2,200 mg/kg and benzene was reported at 2.1 mg/kg at 19.5 feet bgs. These concentrations are among the highest reported in soils at this site. Just above the water table at 15.5 feet bgs, no contaminants of concern were reported above laboratory reporting limits.

Lesser soil impacts were present downgradient, where GRO was reported at 180 mg/kg and benzene was reported below laboratory reporting limits at 18 feet bgs in MW-19. The laboratory did not report any contaminants of concern at levels greater than reporting limits in MW-10R.

No hydrocarbon impacts were reported in soil results from SB-8.

4.4 Groundwater Analytical Results

Antea Group and the drilling subcontractor collected grab groundwater samples from soil borings SB-8, SB-9, and temporary well TW-1. Additionally, subcontractor Blaine Tech collected low-flow samples from new monitoring wells MW-10R, MW-18, and MW-19 along with several existing monitoring wells. All groundwater analytical results are summarized in **Table 3** (recent) and **Table 4** (historical), with the primary contaminants of concern shown on **Figures 5, 6 and 7**. Certified laboratory analytical reports are included in **Appendix I**.

4.4.1 PCE Distribution in Groundwater

Relatively low concentrations of PCE (still in exceedance of the ESLs) are present up-gradient of the site, as confirmed in groundwater samples collected from TW-1 and SB-8 (22 and 63 ug/L, respectively). Higher PCE concentrations continue to be reported in the deeper-screened groundwater monitoring wells (e.g., MW-7, MW-13B, MW-15B) with much lesser or no PCE impacts in the shallow zone (20 feet bgs and above). Refer to **Figure 7** for a map showing all recent (past two years) PCE, trichloroethylene (TCE), and cis-1,2-dichloroethylene (c-1,2-DCE) concentrations at, upgradient, and downgradient of the site. **Figure 7** also indicates the depth of the screened interval from which each grab or low-flow groundwater sample was obtained.

4.4.2 Hydrocarbon Distribution in Groundwater

The results of this investigation show high levels of petroleum hydrocarbons at and downgradient of the subject site. Groundwater analytical results from new well MW-18 show some of the highest dissolved-phase GRO concentrations (98,000 ug/L) and benzene concentrations (3,420 ug/L) reported to date. Across South Delaware Street, MW-10R also reported a very high concentration of GRO (89,300), but a much lower benzene concentration (77.0 ug/L) relative to the concentrations reported on-site nearest the USTs. Analytical results from new well MW-19 also reported relatively high concentrations of GRO (15,700 ug/L) and benzene (13.5 ug/L).

Further downgradient, a grab sample collected from MW-11 showed no hydrocarbon impacts (typical for this well), and although not sampled since February 2012, MW-12B typically shows little to no hydrocarbon impacts, although it is screened in the deeper water-bearing zone (19 to 29 feet bgs), so the full lateral extent of the shallow hydrocarbon plume may not be fully defined in the downgradient direction. Please refer to **Figures 5 and 6** for dissolved-phase GRO and benzene isoconcentration maps.

5.0 QUALITY ASSURANCE/QUALITY CONTROL (QA/QC)

Antea Group performed a QA/QC data validation check on the certified laboratory soil and grab groundwater analytical reports for the current investigation. Certified laboratory reports from Kiff and Pace and lab validation forms completed by Antea Group are contained in **Appendix I.** The following laboratory data qualifiers were noted for individual samples and on laboratory control samples:

Analytical Report No. 80993 dated April 19, 2012 (Kiff):

- TPHG (GRO) for TW-1 primarily contained compounds not found in typical gasoline.

- The Method Reporting Limit for Styrene has been increased due to the presence of an interfering compound for sample SB-9_W.
- Matrix Spike/Matrix Spike Duplicate (MS&MSD) results associated with sample SB-9_W for the analyte Benzene were affected by the analyte concentrations already present in the un-spiked sample.

Analytical Report No. 81304 dated May 24, 2012 (Kiff):

- The Method Reporting Limit for Styrene has been increased due to the presence of an interfering compound for sample MW-18_d19.5.
- TPHG (GRO) for SB-8 primarily contained compounds not found in typical gasoline.

Analytical Report No. 2512399 dated June 12, 2012 (Pace):

- CH - The continuing calibration for this compound is outside of Pace Analytical acceptance limits. The results may be biased high. Noted for ethanol on some LCS and MS&MSD analyses. Ethanol was not detected in any of the groundwater samples.
- D6 - The relative percent difference (RPD) between the sample and sample duplicate exceeded laboratory control limits. Noted for certain analytes on some MS&MSD analyses. Those analytes were not detected in the groundwater samples.
- E - Analyte concentration exceeded the calibration range. The reported result is estimated. Noted for certain analytes on some MS&MSD analyses.
- M1 - Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery. Noted on multiple analyses for MW-13B, including benzene, PCE, and 1,2-DCA. Also noted on some MS&MSD samples.
- S5 - Surrogate recovery outside control limits due to matrix interferences (not confirmed by re-analysis). Noted for surrogate recoveries in MW-10R, MW-6, MW-18, MW-19, and FD-1.

With the exception of high-biased GRO concentrations in SB-8 and TW-1 groundwater samples due to compounds atypical of gasoline (likely PCE), none of the laboratory referenced qualifiers appear to be significant enough to have affected the reported data.

Based on a review of the laboratory's analytical report, including their QA/QC procedures and those implemented by Antea Group, we conclude that the laboratory data obtained during the recent groundwater sampling event are valid and usable for their intended purpose. All pertinent data qualifiers have been noted on **Tables 2, 3,** and **4,** as applicable.

6.0 DISCUSSION

The following sections outline Antea Group's interpretations and opinions following analysis of the results of this and recent subsurface investigations.

6.1 PCE

PCE continues to be reported in groundwater at concentrations exceeding the California Regional Water Quality Control Board (CRWQCB) Environmental Screening Levels (ESLs) for groundwater as a potential drinking resource throughout the entire subject site and surrounding off-site area investigated to date. Highest concentrations of PCE are present in the deeper groundwater zone but not in shallow groundwater due to its molecular weight that is greater than that of water. Based on the higher PCE concentrations in MW-7, MW-12B, MW-13B, and MW-15B, it appears a deep plume of higher PCE concentrations may be skirting along the southern edge of the site, possibly originating from one or more former dry cleaners located southwest of the site. To date, it does not appear that significant or any subsurface environmental testing has been conducted at the nearest former dry cleaners (as shown on GeoTracker), including Wardrobe Cleaners at 344 E 4th Avenue (0.12 miles SW of the site), and R NU IT Cleaners at 200 E 2nd Avenue (0.25 miles W of the site). Another dry cleaner, Family Cleaners, is located approximately 0.10 miles west-northwest of the site.

Antea Group believes that this investigation confirms that historical site activities are not the cause of the PCE issue in deep-zone groundwater based on the absence of PCE contamination in soils beneath the former waste oil UST and the relatively low levels of PCE in groundwater beneath that UST. This, combined with the absence of PCE in soils beneath the site (including from beneath the oil/water separator), supports a conclusion that PCE contamination in groundwater is from an up-gradient source.

6.2 Hydrocarbons

This investigation revealed high levels of GRO and benzene in new wells located southeast (MW-18) and east (MW-10R) of the UST complex. In addition, hydrocarbon concentrations in MW-19 suggest that dilution in MW-4 due to excessive screened interval (as suggested by GPP) was previously causing low-biased hydrocarbon concentrations at that location. The high concentrations in MW-10R suggest that the lateral extent of hydrocarbons in groundwater and downgradient of the existing UST cavity extends beyond South Delaware Street. Impacted soils do not appear to extend across South Delaware Street, but impacts are present in smear-zone soils as far south as MW-18.

7.0 CONCLUSIONS AND RECOMMENDATIONS

Antea Group completed this additional subsurface investigation and groundwater sampling in April and May 2012 to further evaluate tetrachloroethylene (PCE) and petroleum hydrocarbons in groundwater and soils at and adjacent to the 76 Service Station No. 6390, located at 402 Delaware Street in San Mateo, California. Antea Group completed a work scope in general accordance with the San Mateo County Groundwater Protection Program (GPP)

letter dated November 22, 2011 and subsequent correspondence in order to: 1) further assess the possible on-site origin of PCE, and 2) further define the lateral extent of hydrocarbons in smear-zone soils and groundwater east and south of the existing underground storage tanks (USTs).

Antea Group concludes the following with respect to this and prior investigations:

- Whereas PCE continues to be present at higher concentrations in deep-zone groundwater downgradient of the subject site, there is no proven source of PCE from the subject site, including beneath a former waste oil UST and an oil/water separator. The PCE in groundwater is likely from an up-gradient source, a conclusion that is supported by similarly high levels of PCE in up-gradient well MW-7 relative to other on-site and downgradient monitoring wells.
- Significant petroleum hydrocarbon impacts extend beyond South Delaware Street to the east, downgradient of the gasoline USTs. Further downgradient, deep-zone well MW-12B may not be accurately evaluating hydrocarbon impacts based on the well's deeper screen interval.
- Some of the highest concentrations of petroleum hydrocarbons in groundwater and in smear-zone and saturated soils are present southeast of the UST complex, in the vicinity of boring SB-7 and new well MW-18.

Based on the results of this and prior investigations and groundwater monitoring results, Antea Group recommends the following:

- Further delineation of hydrocarbons in shallow (first-encountered) groundwater downgradient of MW-10R;
- Further delineation of hydrocarbons in shallow groundwater between the off-site commercial building (parcel #034-186-090) and MW-11;
- Evaluation of shallow soil vapor concentrations at the southeastern property boundary, between MW-18 and the off-site commercial building (parcel #034-186-090); and
- Evaluation of shallow soil vapor concentrations between MW-10R and the off-site residential building (parcel #034-189-100).

8.0 REMARKS

The findings contained in this report represent Antea Group's professional opinions based upon the currently available information and are arrived at in accordance with currently acceptable professional standards. For any reports cited that were not generated by Antea USA, Inc., the data from those reports are used "as is" and is assumed to be accurate. Antea USA, Inc does not guarantee the accuracy of this data for the referenced work performed nor the inferences or conclusions stated in these reports. This report is based upon a specific scope of work requested by the client. The Contract between Antea Group and its client outlines the scope of work, and only those tasks specifically authorized by that contract or outlined in this report were performed. This report is intended only for the use of Antea Group's Client and anyone else specifically listed on this report. Antea Group will not and cannot be liable for unauthorized reliance by any other third party. 1	Analyzed by EPA Method 3550/8015M
2	Analyzed by Standard Method 5520 E&F (Gravimetric)
3	Analyzed by EPA Method 5030/8015M between 8/1992 and 3/1995; by EPA Method 8260 between 12/2006 and the present.
4	Analyzed by EPA Method 8020 between 8/1992 and 3/1995; by EPA Method 8260 between 12/2006 and the present.
5	Analyzed by EPA Method 8260B
6	Analyzed by EPA Method 6000/7000
a	Sample was analyzed for Halogenated Volatile Organic Hydrocarbons (HVOCs) by EPA Method 8010. Tetrachloroethene was detected at 0.0064 mg/kg. The additional HVOCs were reported as non-detect.
b	Chromatograph pattern: Diesel and non-diesel mixture (<C14; >C22).
c	Sample was analyzed for HVOCs by EPA Method 8010. All HVOCs were reported as non-detect.
d	The Continuing Calibration Verification (CCV) recovery was not within established control limits.
e	The PQL'S and MDL's was raised due to sample dilution.
f	Estimated Value (CLP Flags)
g	Surrogate recovery outside control limits due to matrix interferences (not confirmed by re-analysis). Noted on toluene-d8 (S) and 4-Bromofluorobenzene (S
h	Analyte recovery in the laboratory control sample (LCS) was below QC limits. Result may be biased low
i	Result confirmed by second analysis

Notes:

<	Denotes less than the Laboratory Reporting Limit	ESL	Environmental screening level	PCE	Tetrachloroethene	TAME	tert-amyl methyl ether
--	Not applicable / measured	GRO	Gasoline range organics	cis-1,2-DCE	cis-1,2-dichloroethylene	1,2-DCA	1,2-Dichloroethane
µg/L	Micrograms per liter	GWE	Groundwater elevation	NAPL	Non-Aqueous Phase Liquid	VC	Vinyl Chloride
BTEX	Benzene, toluene, ethylbenzene, xylenes	GW	Groundwater	TCE	Trichloroethene		
CRWQCB	California Regional Water Quality Control Board	MTBE	Methyl tertiary butyl ether	TBA	tert-butyl alcohol		
TOC	Top of Casing						

1 = TOC elevations have been surveyed to the NAVD 88 datum (refer to Table 1 for date of each well's survey)

2 = Analyzed by EPA Method 8260B.

3 = Field duplicate FD1 collected from well MW-6.

4 = Trip blank sample for QA/QC

A = GRO primarily contained compounds not found in typical gasoline.

M1 = The matrix spike exceeded the laboratory's QC limits. The batch was accepted based upon acceptable recovery from the laboratory control sample.

S5 = Surrogate recovery was outside control limits due to matrix interferences (not confirmed by re-analysis).

♦ The elevations were surveyed relative to mean sea level, per the City of San Mateo Benchmark #33-2 (elevation = 17.65 feet amsl)

† TOC elevations were surveyed by Morrow Surveying on August 13, 2005 to the NAVD 88 datum by GPS observations.

†† TOC elevations were surveyed by Morrow Surveying on January 16, 2007 to the NAVD 88 datum by GPS observations.

††† TOC elevations were surveyed by Mid Coast Engineers on August 18, 2008 to the NAVD 88 datum by GPS observations.

†††† TOC elevation was surveyed by Mid Coast Engineers on June 6, 2011 to the NAVD 88 datum by GPS observations.

††††† TOC elevation was surveyed by Mid Coast Engineers on May 25, 2012 to the NAVD 88 datum by GPS observations.

1 Analyzed by EPA Method 5030/8015M between 6/15/94 and 8/10/99, on 8/9/00, on 11/8/00, and between 2/13/02 and 2/18/03; by DHS LUFT between 11/9/99 and 5/18/00; on 2/14/01, and on 8/15/01; by EPA Method 8260B between 8/21/03 and the present.

2 Analyzed by EPA Method 5030/8020 between 6/15/94 and 8/10/99, on 8/9/00, and on 11/8/00; by DHS LUFT between 11/9/99 and 5/18/00, and on 2/14/01; by EPA Method 8021B between 2/13/02 and 2/18/03; by EPA Method 8260B between 8/21/03 and the present.

3 Analyzed by EPA Method 8020M between 3/8/96 and 8/10/99, on 8/9/00, and on 11/8/00; by DHS LUFT between 11/9/99 and 5/18/00, and on 2/14/01; by EPA Method 8021B between 2/13/02 and 2/18/03; by EPA Method 8260B between 8/21/03 and the present.

4 Analyzed by EPA Method 8260B.

a The presence of MTBE was potentially identified at reportable levels.

b The presence of MTBE was identified at a level equal to or above the taste and odor threshold of 40 µg/L.

c The hydrocarbons detected appeared to be gasoline and a non-gasoline mixture.

d Chromatograph pattern: unidentified hydrocarbons C6-C12

e Chromatograph pattern: weathered gasoline: C6-C12

f Chromatograph pattern: discrete peaks C8-C12

g Chromatograph pattern: discrete peaks

h Sample was additionally run under EPA Method 8260B. MTBE was detected at 1,140 µg/L. All other analytes were non-detect.

i Single analyte peak(s) were present in the requested fuel quantitation range. Fuel hydrocarbon pattern was not present.

j The concentration reported reflect(s) individual or discrete unidentified peaks not matching a typical fuel pattern.

TABLE 4
HISTORICAL GROUNDWATER GAUGING AND ANALYTICAL DATA
76 STATION NO. 6390
402 SOUTH DELAWARE STREET
SAN MATEO, CALIFORNIA

Sample ID	As - Built Screen Interval (ft below TOC)	TOC Elevation (feet)	Date Sampled	Depth to GW (ft below TOC)	GWE (feet)	GWE Change (feet)	NAPL Thickness (feet)	Sheen	GRO [1] (µg/L)	BTEX [2]				MTBE [3] (µg/L)	TBA [4] (µg/L)	TAME [4] (µg/L)	1,2-DCA [4] (µg/L)	Chloroform [4] (µg/L)	PCE [4] (µg/L)	TCE [4] (µg/L)	cis-1,2-DCE [4] (µg/L)	VC [4] (µg/L)	Ethanol [4] (µg/L)	Sulfide (mg/L)	Nitrate (mg/L)	Sulfate (mg/L)
										Benzene (µg/L)	Toluene (µg/L)	Ethylbenzene (µg/L)	Xylenes (µg/L)													
k	Reporting limits (PQL or MDL) were raised due to the high level of analyte present in the sample ("D4")																									
l	Detection limit raised due to sample dilution																									
m	Estimated value																									
n	Chromatogram not typical of gasoline.																									
o	The BC laboratory report indicated that reported concentration of 200 µg/L TPPH was due only to the presence of 90 µg/L PCE, 15 µg/L trichloroethane, and 9.8 µg/L cis-1,2-DCA; therefore, SECOR has represented the results for TPPH in this laboratory report as non-detect.																									
p	TPPH was positive due to PCE present in the sample.																									
q	PCE, TCE, and/or 1,2-DCE were subtracted from the gasoline range TPPH, or GRO.																									
r	Sample hold time was exceeded.																									
s	Not enough sample to re-run for PCE.																									
t	First run did not pass, sample had to be diluted due to not enough sample. Only one voa submitted to lab.																									
u	Depth to GW was collected on 9/28/2007 and sample was collected on 8/30/2007																									
v	Sample also analyzed for TPH-diesel (reported at a concentration of 28,000, with the chromatogram reporting a diesel and non-diesel mixture (<C16, >C22)																									
w	Result was positive due to PCE and TCE present in the sample.																									
x	Data from re-sampling event on 3/30/2010.																									
y	"L2" = Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results for this analyte in associated samples may be biased low.																									
z	"M0" = Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory reporting limits.																									
aa	"T4" = Result reported for hydrocarbons within the method-specific range that do not match pattern of laboratory standard.																									
bb	"1n" = The GRO result for this sample did not match the pattern of the laboratory standard for gasoline, likely due to the presence of PCE in the sample																									
cc	GRO primarily contained compounds not found in typical gasoline																									
dd	"M1" = The matrix spike exceeded the laboratory's QC limits. The batch was accepted based on acceptable recovery from the laboratory control sample.																									
ee	samples also tested for full VOCs, refer to laboratory analytical report for full list of analytes and results.																									
S5	Surrogate recovery was outside control limits due to matrix interferences (not confirmed by re-analysis).																									
	Analytical data prepared by Sequoia Analytical between 6/15/94 and 2/18/04; by Severn Trent Laboratories between 8/21/03 and 3/01/06; by BC Laboratories between 8/02/06 and 7/30/09, and by Pace Analytical / Kiff Analytical between 1/18/10 and the present.

FA0049033

 2011 SUBSURFACE DRILLING PERMIT APPLICATION

REQUIREMENTS:

An accurate & correct map of existing and proposed well/boring locations **must** be included with the permit application. The well/boring location map **must** include the following.

1. North arrow, existing & historic site features, wells, approximate property lines and any other pertinent existing & historic features and information.
2. Proposed well/boring locations to scale.

A work plan describing the drilling and construction/destruction methodology, at a minimum, is **required** by County Staff. Upon review of information on this application and the submitted work plan, and subject to approval noted below, a permit will be issued allowing well/boring owner, driller, and responsible professional (consultant) to perform the specified work. The permit is subject to both General and Special Conditions stated below. A copy of the approved Subsurface Drilling Permit **must** be available on site while work related to the permit is being performed. Drilling may begin at the notified date and time whether County staff is present or not.

GENERAL CONDITIONS:

A. Well and boring construction and destruction under this permit is subject to the Standards for the Construction of Wells in San Mateo County, County Groundwater Protection Program (GPP) Guidelines, Policies & Procedures, the State Water Well Standards, and any instructions by a Health Department representative.

B. Well/Boring Owner, Driller, and Responsible Professional assume responsibility for all activities and uses under the permit, including compliance with Workmen's Compensation Laws, and indemnify, defend and save the County of San Mateo, its' officers, agents and employees, free and harmless from any and all expense, cost, or liability in connection with or resulting from work or stopped-work associated with the permit, including, but not limited to, property damage, personal injury, wrongful death, and loss of income.

C. All borings **must** be properly destroyed (grouted/sealed) within 24 hours of drilling unless special conditions are approved in writing as part of this permit.

D. Analytical results of all soil and groundwater samples collected during the execution of drilling under this permit **must** be submitted to County GPP staff by the Responsible Professional within 60 days of sample collection. If contamination is discovered during drilling, verbal notification to County GPP by the Responsible Professional is **required** within 72 hours of discovery. Proper storage, labeling & disposal of investigation-derived residual wastes are the responsibility of the consultant unless stated otherwise contractually.

E. A copy of the State DWR Form 188, boring logs and well construction details for all borings/wells except geotechnical borings, signed by a Responsible Professional, **must** be submitted to County GPP by the Responsible Professional within 60 days of drilling/construction/destruction. As-built locations/dimensions **must** be finalized in subsequent report of findings submitted to County GPP by the Responsible Professional within 60 days of drilling/construction/destruction.

F. Permit is valid only for the purpose specified herein. No change in purpose or required procedures, as described on this permit application, in the associated workplan, or in the special conditions below, will be allowed except upon written permission from the County. Construction aspects can be changed based on conditions encountered in the field.

G. Permit is valid for mobilizations associated with originally permitted boring/monitoring well locations only, including contingency locations, and is automatically canceled if not exercised, or if an extension is not applied for and granted by County GPP, within 120 days of the original permit issuance date. Failure to notify staff of cancellation or delay in start time, at least one minute prior to the notified start time, will result in the Consultant being billed an Inspection Cancellation fee of $264 for 2011 if GPP staff attempted to perform an inspection.

H. Wells installed under this permit may not be used for domestic, municipal, commercial, or irrigation water supply.

I. All work plans and reports related to work performed under County oversight **must** conform to Business and Profession Codes and State Water Well Standards.

J. Top-of-casing elevation of all wells **must** be surveyed to the nearest 0.01-foot relative to Mean Sea Level (NAVD88) and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate. Geotechnical wells are exempt from this requirement if a written variance from GPP is obtained prior to drilling.

K. Latitude and longitude of all wells **must** be surveyed with sub-meter accuracy relative to NAD83 and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate.

L. Violation of any requirement or general or special permit condition may result in an order by GPP staff to cease work under this permit, correct the violation, and potentially re-permit the work as a new mobilization.

SPECIAL ~~CONDITIONS~~: WE HIGHLY RECOMMEND PROPOSED MW-18 BE INSTALLED BEHIND THE SIDEWALK ADJACENT TO NORTH CORNER OF BLDG AT 521 5th (requires new permit application). PROPOSED LOCATION MAY NOT ADEQUATELY ASSESS POTENTIAL RISK TO BUILDING OCCUPANTS

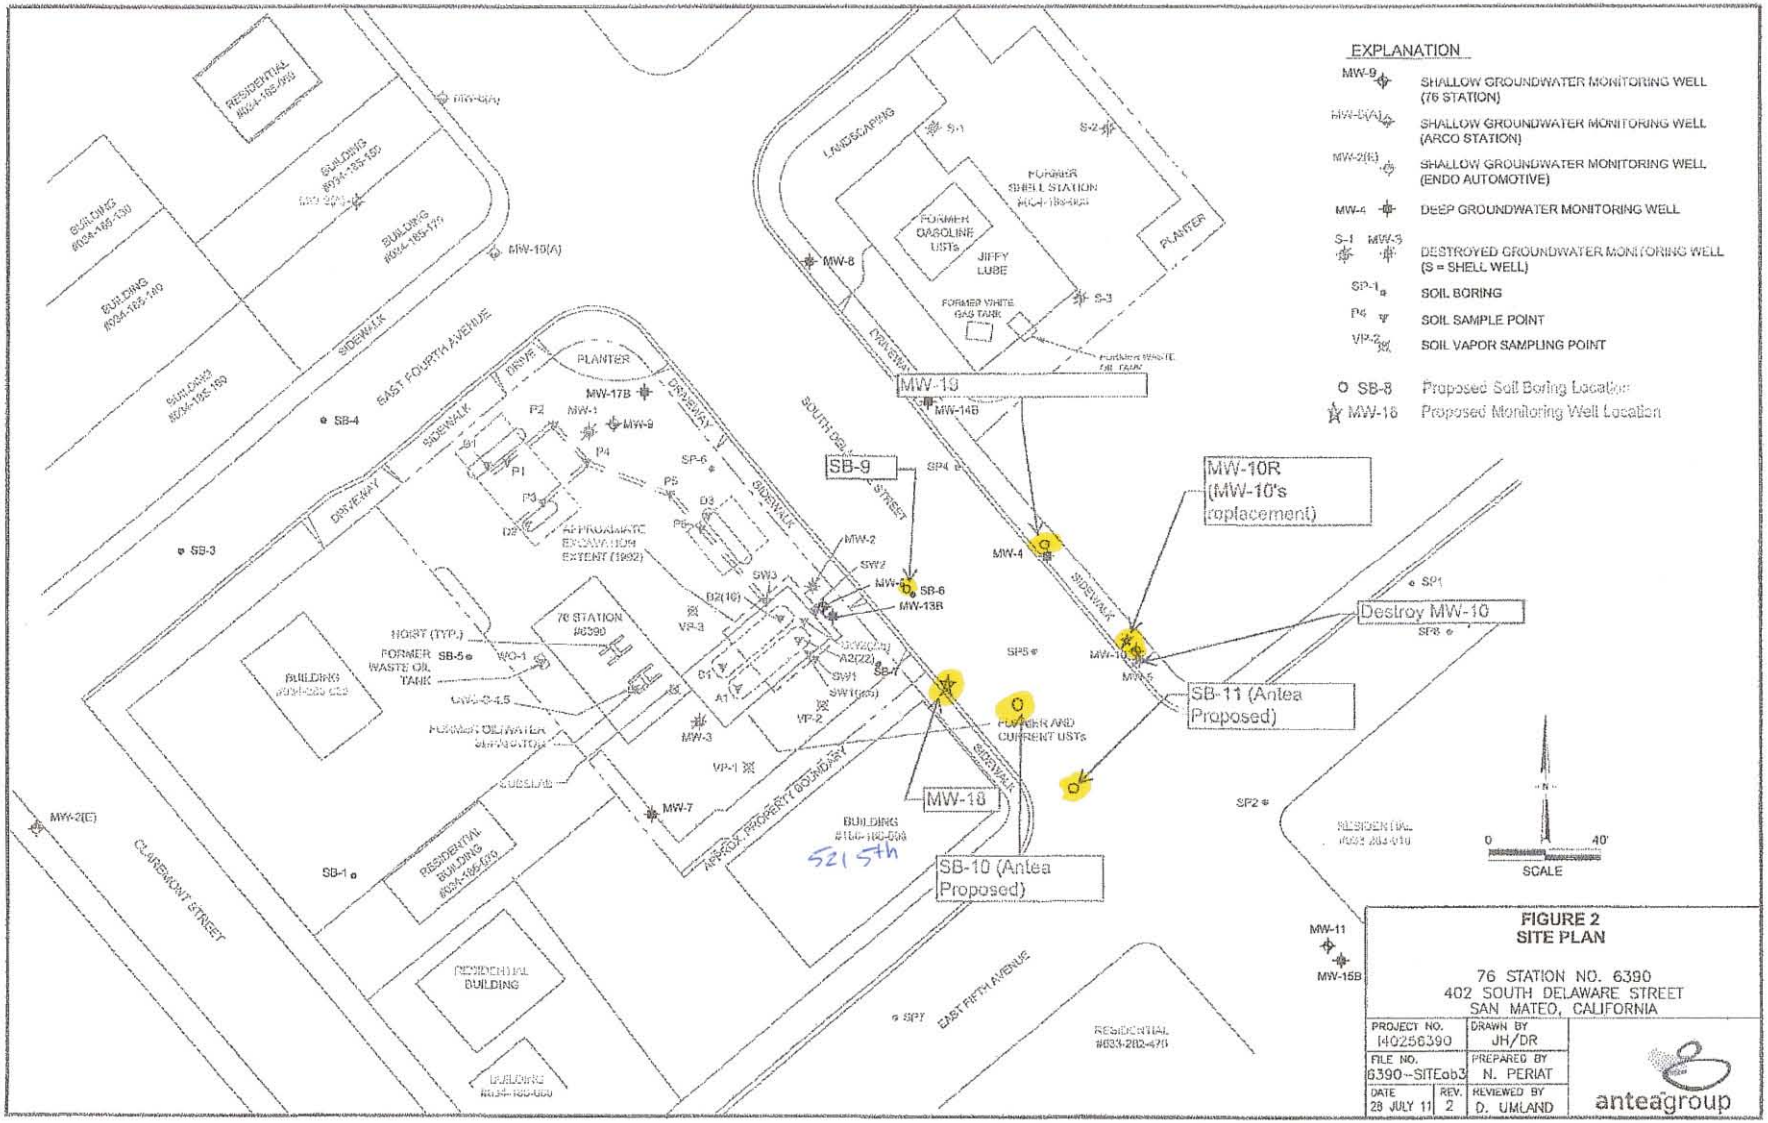
Subject: Letter of Intent – Permit rider #9 for permit #4818 for monitoring well construction and destruction and soil boring advancements in South Delaware Street between East Fourth Avenue and East Fifth Avenue

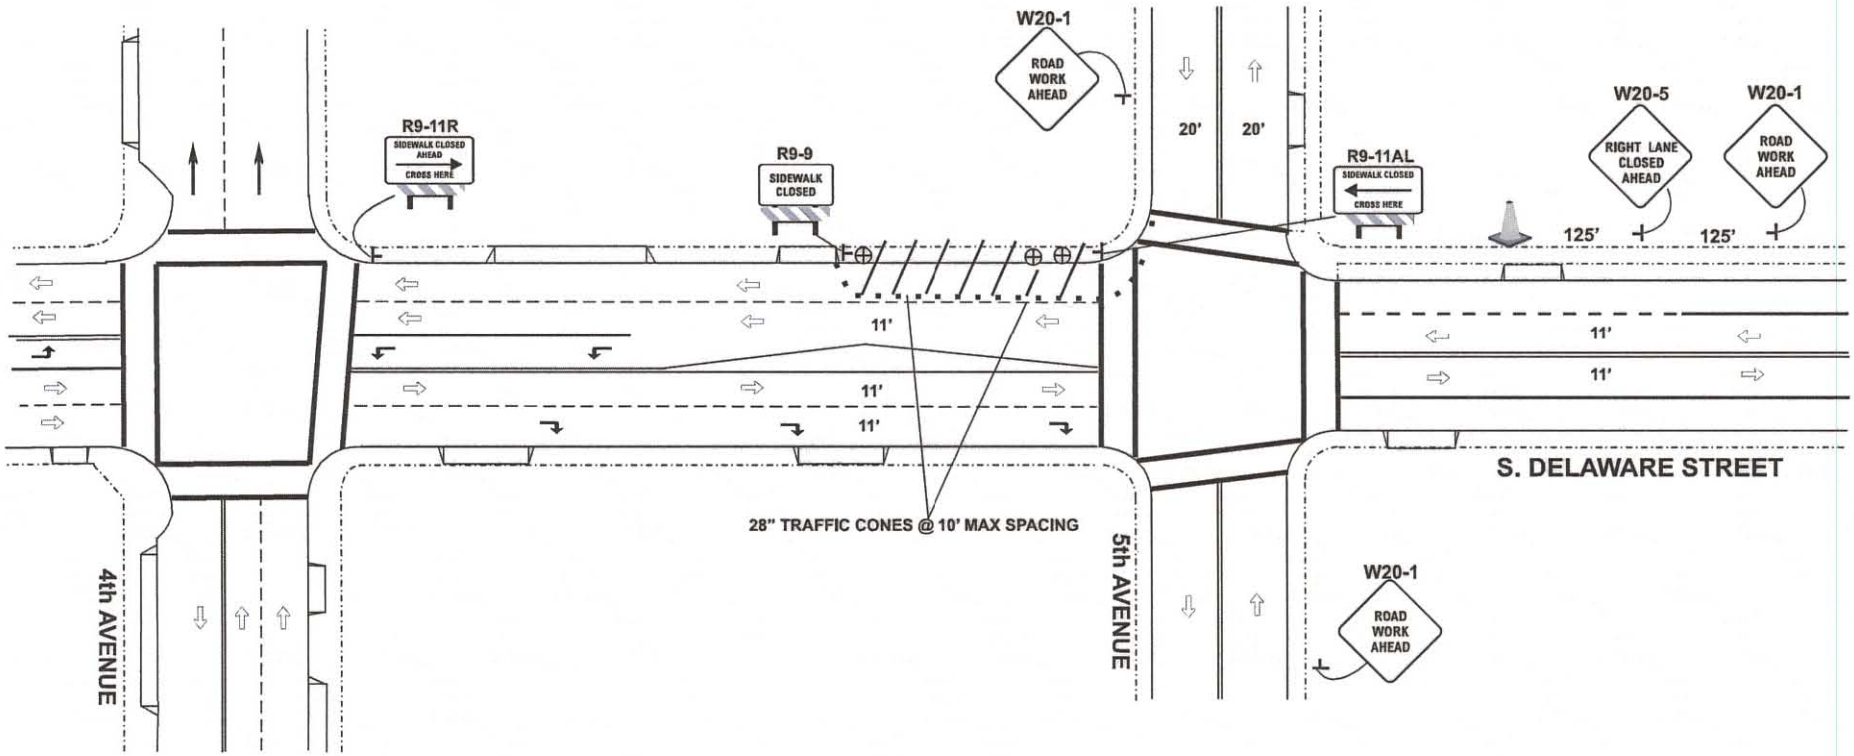
Dear Ms. Judy Dulik:

Antea™Group (Antea Group) has prepared this letter of intent regarding the proposed construction of monitoring wells MW-10R, MW-18, MW-19, destruction of monitoring well MW-10, and advancement of soil borings SB-9 through SB-11 in South Delaware Street between East Fourth Avenue and East Fifth Avenue. All proposed work is related to 76 Service Station No. 6390, located at 402 South Delaware Avenue in San Mateo, California (see attached site plan). Antea Group will be requesting permit rider #9 for permit #4818 for the proposed scope of work.



The proposed scope of work is based on following documents that have been uploaded to the State GeoTracker database: 1) assessment report dated July 28, 2011; 2) addendum to the assessment report dated August 10, 2011; 3) revised laboratory report dated September 2, 2011; and 4) an unsolicited workplan dated August 9, 2011; and 5) correspondence with Mr. Deno Milano of the San Mateo County Groundwater Protection Program (GPP), the regulatory overseer for the site, dated November 22, 2011.

Sincerely,



David Sisak
Staff Professional

FA50947

 2011 SUBSURFACE DRILLING PERMIT APPLICATION

REQUIREMENTS:

An accurate & correct map of existing and proposed well/boring locations **must** be included with the permit application. The well/boring location map **must** include the following.

1. North arrow, existing & historic site features, wells, approximate property lines and any other pertinent existing & historic features and information.
2. Proposed well/boring locations to scale.

A work plan describing the drilling and construction/destruction methodology, at a minimum, is **required** by County Staff. Upon review of information on this application and the submitted work plan, and subject to approval noted below, a permit will be issued allowing well/boring owner, driller, and responsible professional (consultant) to perform the specified work. The permit is subject to both General and Special Conditions stated below. A copy of the approved Subsurface Drilling Permit **must** be available on site while work related to the permit is being performed. Drilling may begin at the notified date and time whether County staff is present or not.

GENERAL CONDITIONS:

A. Well and boring construction and destruction under this permit is subject to the Standards for the Construction of Wells in San Mateo County, County Groundwater Protection Program (GPP) Guidelines, Policies & Procedures, the State Water Well Standards, and any instructions by a Health Department representative.

B. Well/Boring Owner, Driller, and Responsible Professional assume responsibility for all activities and uses under the permit, including compliance with Workmen's Compensation Laws, and indemnify, defend and save the County of San Mateo, its' officers, agents and employees, free and harmless from any and all expense, cost, or liability in connection with or resulting from work or stopped-work associated with the permit, including, but not limited to, property damage, personal injury, wrongful death, and loss of income.

C. All borings **must** be properly destroyed (grouted/sealed) within 24 hours of drilling unless special conditions are approved in writing as part of this permit.

D. Analytical results of all soil and groundwater samples collected during the execution of drilling under this permit **must** be submitted to County GPP staff by the Responsible Professional within 60 days of sample collection. If contamination is discovered during drilling, verbal notification to County GPP by the Responsible Professional is **required** within 72 hours of discovery. Proper storage, labeling & disposal of investigation-derived residual wastes are the responsibility of the consultant unless stated otherwise contractually.

E. A copy of the State DWR Form 188, boring logs and well construction details for all borings/wells except geotechnical borings, signed by a Responsible Professional, **must** be submitted to County GPP by the Responsible Professional within 60 days of drilling/construction/destruction. As-built locations/dimensions **must** be finalized in subsequent report of findings submitted to County GPP by the Responsible Professional within 60 days of drilling/construction/destruction.

F. Permit is valid only for the purpose specified herein. No change in purpose or required procedures, as described on this permit application, in the associated workplan, or in the special conditions below, will be allowed except upon written permission from the County. Construction aspects can be changed based on conditions encountered in the field.

G. Permit is valid for mobilizations associated with originally permitted boring/monitoring well locations only, including contingency locations, and is automatically canceled if not exercised, or if an extension is not applied for and granted by County GPP, within 120 days of the original permit issuance date. Failure to notify staff of cancellation or delay in start time, at least one minute prior to the notified start time, will result in the Consultant being billed an Inspection Cancellation fee of $264 for 2011 if GPP staff attempted to perform an inspection.

H. Wells installed under this permit may not be used for domestic, municipal, commercial, or irrigation water supply.

I. All work plans and reports related to work performed under County oversight **must** conform to Business and Profession Codes and State Water Well Standards.

J. Top-of-casing elevation of all wells **must** be surveyed to the nearest 0.01-foot relative to Mean Sea Level (NAVD88) and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate. Geotechnical wells are exempt from this requirement if a written variance from GPP is obtained prior to drilling.

K. Latitude and longitude of all wells **must** be surveyed with sub-meter accuracy relative to NAD83 and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate.

L. Violation of any requirement or general or special permit condition may result in an order by GPP staff to cease work under this permit, correct the violation, and potentially re-permit the work as a new mobilization.

FA 51532

 2012 SUBSURFACE DRILLING PERMIT APPLICATION

REQUIREMENTS:

An accurate & correct map of existing and proposed well/boring locations **must** be included with the permit application. The well/boring location map **must** include the following.

1. North arrow, existing & historic site features, wells, approximate property lines and any other pertinent existing & historic features and information.
2. Proposed well/boring locations to scale.

A work plan describing the drilling and construction/destruction methodology, at a minimum, is **required** by County Staff. Upon review of information on this application and the submitted work plan, and subject to approval noted below, a permit will be issued allowing well/boring owner, driller, and responsible professional (consultant) to perform the specified work. The permit is subject to both General and Special Conditions stated below. A copy of the approved Subsurface Drilling Permit **must** be available on site while work related to the permit is being performed. Drilling may begin at the notified date and time whether County staff is present or not.

GENERAL CONDITIONS:

A. Well and boring construction and destruction under this permit is subject to the Standards for the Construction of Wells in San Mateo County, County Groundwater Protection Program (GPP) Guidelines, Policies & Procedures, the State Water Well Standards, and any instructions by a Health Department representative.

B. Well/Boring Owner, Driller, and Responsible Professional assume responsibility for all activities and uses under the permit, including compliance with Workmen's Compensation Laws, and indemnify, defend and save the County of San Mateo, its' officers, agents and employees, free and harmless from any and all expense, cost, or liability in connection with or resulting from work or stopped-work associated with the permit, including, but not limited to, property damage, personal injury, wrongful death, and loss of income.

C. All borings **must** be properly destroyed (grouted/sealed) within 24 hours of drilling unless special conditions are approved in writing as part of this permit. Borings lasting longer than 24 hours without a variance are considered wells.

D. Analytical results of all soil and groundwater samples collected during the execution of drilling under this permit **must** be submitted to County GPP staff by the Responsible Professional within 60 days of sample collection. If contamination is discovered during drilling, verbal notification to County GPP by the Responsible Professional is **required** within 72 hours of discovery. Proper storage, labeling & disposal of investigation-derived residual wastes are the responsibility of the consultant unless stated otherwise contractually.

E. A copy of the State DWR Form 188, boring logs and well construction details for all borings/wells except geotechnical borings, signed by a Responsible Professional, **must** be submitted to County GPP by the Responsible Professional within 60 days of drilling/construction/destruction. As-built locations/dimensions **must** be finalized in subsequent report of findings submitted to County GPP by the Responsible Professional within 60 days of drilling/construction/destruction.

F. Permit is valid only for the purpose specified herein. No change in purpose or required procedures, as described on this permit application, in the associated workplan, or in the special conditions below, will be allowed except upon written permission from the County. Construction aspects can be changed based on conditions encountered in the field.

G. Permit is valid for mobilizations associated with originally permitted boring/monitoring well locations only, including contingency locations, and is automatically canceled if not exercised, or if an extension is not applied for and granted by County GPP, within 120 days of the original permit issuance date. Failure to notify staff of cancellation or delay in start time, at least one minute prior to the notified start time, will result in the Consultant being billed an Inspection Cancellation fee of $264 for 2012 if GPP staff attempted to perform an inspection.

H. Wells installed under this permit may not be used for domestic, municipal, commercial, or irrigation water supply.

I. All work plans and reports related to work performed under County oversight **must** conform to Business and Profession Codes and State Water Well Standards.

J. Top-of-casing elevation of all wells **must** be surveyed to the nearest 0.01-foot relative to Mean Sea Level or NAVD88 and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate. Geotechnical wells are exempt from this requirement if a written variance from GPP is obtained prior to drilling.

K. Latitude and longitude of all wells **must** be surveyed with sub-meter accuracy relative to NAD83 and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate.

L. Violation of any requirement or general or special permit condition may result in an order by GPP staff to cease work under this permit, correct the violation, and potentially re-permit the work as a new mobilization.

In compliance with (☐ your ☐ our) request, the City of San Mateo, Public Works Department is hereby amending the above-referenced encroachment permit as follows:

Same conditions as original permit and subsequent riders. Install 2 monitoring wells (MW-10R, MW-19) destroy 1 well (MW-10), perform 1 soil boring (SB-9) per attached plan. Traffic control per Caltrans standards and approved attached traffic control plan. **No street closures allowed, must allow through traffic at all times.** Contractor must notify PW Inspections 650/522-7522 xt 6900, Police 650/522-7700, Fire 650/522-7940, and County Communications 650/363-4961, at least 24 - 48 hours before any proposed lane closures. Refund upon submittal of test results, and abandonment of all wells in the public right-of-way related to this permit.

Permit Expiration Date extended to: ☒ 10/01/12

☐ No Change

Except as amended, all other terms and provisions of the original permit shall remain in effect.

SUBJECT: UNOCAL 76 STATION #6390 AT 402 SOUTH DELAWARE STREET, SAN MATEO, CALIFORNIA

Dear Mr. Hunter:

Antea Group recently uploaded the following documents to the State GeoTracker database: 1) assessment report dated July 28, 2011; 2) addendum to the assessment report dated August 10, 2011; 3) revised laboratory report dated September 2, 2011; and 4) an unsolicited workplan dated August 9, 2011. The following comments are based on San Mateo County Groundwater Protection Program (GPP) staff review of these documents and the project file.

PCE and Gasoline Assessment Report

The GeoBore and GeoWell files for the investigation have not been uploaded to the State GeoTracker database as required by State regulations. Please **immediately** upload these files to complete the investigation (the deadline was July 28, 2011). Please also ensure the GeoBore file for MW-17B lists the proper casing diameter (incorrectly listed on boring log in Appendix H).

The well screen listed for MW-15B on Table 1 and the TPPH concentrations listed on the vapor results table in Appendix D are incorrect. In addition, the historical groundwater results tables in Appendix E do not include the historical grab groundwater sampling results and a significant amount of solvent results from the monitoring wells. Please ensure future data tables are accurate and complete. Please also consider adding recent and future investigative results to the appropriate portion of the historical results tables to assist the evaluation of site conditions.

Cross-Section A-A' (Figure 6A) is very informative. However, it does not show the location of the former Unocal waste oil UST (potential PCE source area) and the soil textures shown adjacent to Boring SB-6 and MW-4 appear to conflict with those shown on the boring log. Please ensure future cross-sections consider these observations.

Section 3.2 states the site is located in the South Bay groundwater basin. Please note, the site is within the Santa Clara Valley groundwater basin and South Bay hydrologic planning area (watershed) according to the Regional Water Quality Control Board (RWQCB).

Section 3.3 states an aquitard has been identified at approximately 25 feet below grade (fbg) and a deeper groundwater bearing zone has been reported beneath this aquitard from 13 to 18.5 fbg. This statement does not make sense. Please ensure future reports discussing hydrologic conditions clarify what is meant by this statement.

The report indicates a number of soil samples collected from Borings SB-1, SB-3, SB-4, SB-5, and MW-17B were analyzed for TPPH, BTEX, fuel oxygenates, and halogenated volatile organic compounds (HVOCs). These analyses were not required by GPP staff, nor were they proposed in the October 29, 2010, workplan approved in our letter dated February 8, 2011. Only the analysis of the soil samples collected from SB-5 at ≥15 fbg appears justified because no groundwater samples were collected from this boring. Therefore, we cannot recommend the UST Cleanup Fund reimburse the cost to analyze the soil samples from SB-1, SB-3, SB-4, and MW-17B.

Section 5.1 indicates all boreholes except SB-6 were air-knifed to 5 fbg. Although we don't anticipate PCE-affected soil at 5 fbg, future data tables should nevertheless indicate via footnote that air-knifing may have affected the volatile organic compound content of the 5 foot samples.

The results of the investigation indicate a PCE source exists upgradient of the site. However, we cannot establish whether the former waste oil UST at the Unocal site contributed to the PCE plume (one of the objectives of the investigation) because: 1) the groundwater PCE results in upgradient Borings SB-1, SB-3, and SB-4 and T. Endo Automotive well MW-2 are 12 to 242 times less than the PCE concentration reported in MW-13B which is located downgradient of the former Unocal waste oil UST; 2) no groundwater sample was collected from SB-5 to determine whether the former gasoline station on the parcel immediately west of the site may have contributed to PCE reported in MW-13B; and 3) upgradient Borings SB-1, SB-3, and SB-4 were drilled to 30 fbg (approximately 15 feet below the depth to groundwater) and groundwater samples were only collected from the lower 5 feet of these borings instead of the lower 10 feet proposed in the approved workplan (i.e. we cannot establish if first groundwater in SB-1, SB-3, and SB-4 contains greater PCE concentrations which may eliminate Unocal as a potential PCE source). Therefore, we do not concur with the recommendation to discontinue further PCE assessment (refer to the additional assessment discussed in the workplan section of this letter).

The report refers to "A" and "B" zone groundwater and indicates the groundwater in the "A" zone is perched (Sections 6.1 and 8.0). No justification has been provided to demonstrate first groundwater is perched. This appears to be an artifact from older reports.

The report compares the laboratory results from the analysis of soil samples collected from the saturated zone to RWQCB Environmental Screening Levels (e.g. Section 6.2.1 and 6.2.2). Please note, the soil ESLs established by the RWQCB only apply to soil samples collected from the unsaturated zone.

It appears the vertical extent of gasoline-affected soil and fuel impact to deeper groundwater has been adequately assessed based on the laboratory results from the analysis of soil and

groundwater samples. However, the lateral extent of fuel hydrocarbons in first groundwater has not been assessed east and southeast of MW-6 and SB-7. The elevated fuel hydrocarbon concentrations in the groundwater from SB-7 and the drilling depth indicate first groundwater near this boring may contain non-aqueous phase liquid. In addition, the fuel hydrocarbon concentrations reported in the SB-6 groundwater sample may underestimate fuel hydrocarbon impact to first groundwater because this boring was drilled approximately 15 feet below the depth to groundwater and the groundwater sample was collected from the lower 5 feet of the boring (soil sample laboratory results, PID screening, and a comparison of the dissolved-phase hydrocarbon concentrations in MW-6 and MW-13B indicate the sampling depth of this groundwater sample should not have exceeded 20 fbg). Therefore, GPP staff are requiring additional assessment of fuel hydrocarbons in first groundwater east and southeast of the fuel UST cavity (discussed in the workplan section of this letter).

The report recommends preparing a remedial action investigation workplan to mitigate hydrocarbons in the vicinity of MW-6, but not within Delaware Street. GPP staff cannot concur with this recommendation at this time because: 1) the need for remediation has not been justified; 2) the value of mitigating hydrocarbons within only a 6-foot-interval between the fuel UST cavity and Delaware Street was not justified; 3) the extent and impact of fuel hydrocarbons in first groundwater has not been assessed east and southeast of the fuel UST cavity; and 4) the potential contribution of PCE from the Unocal site has not been established. These factors affect the need and scope of remediation (please refer to workplan section of this letter for additional required assessment). Please note, remediation may not be necessary if the gasoline release is the only driver for the Unocal site and the fuel impact does not contain NAPL, is limited to under the street, is stable, does not pose a significant risk to human health and environment, and will degrade to RWQCB water quality objectives within a reasonable time.

The well purging field procedures discussed in Appendix G and used for MW-17B (Appendix G) were not the procedures proposed by Antea in their November 2010 groundwater monitoring report and conditionally approved in our letter dated December 2, 2010. No justification was provided for deviating from the approved protocol. Please ensure sampling is performed in accordance with approved protocols unless the report justifies the deviation(s).

Addendum to Assessment Report

The addendum recommends adding MW-17B to the groundwater monitoring program. GPP staff concur with this recommendation. Please note, however, it is not necessary to recommend adding a new well to the groundwater monitoring program. This action is expected when we approve the installation of the well(s).

The addendum also recommends increasing the frequency of groundwater monitoring from annual to semi-annual in order to build an adequate data set in a reasonable amount of time. GPP staff can support semi-annual monitoring of MW-6 (increasing benzene concentrations) and of MW-12B and MW-13B (elevated PCE impacts), but not semi-annual monitoring of the other

wells because only minor impacts have been reported in the other wells. However, we support semi-annual monitoring of future wells installed east and southeast of the fuel UST cavity to monitor first groundwater (refer to the workplan section of this letter).

Revised Laboratory Report for the Assessment Report

The revised laboratory report pertains to the analysis of the soil samples from Borings SB-1, SB-3 through SB-5, SB-7, and MW-17B and the analysis of the groundwater samples from SB-1, SB-3, SB-4, and SB-7. The report adequately explains the impact of all data qualifiers on the laboratory results except qualifiers S0 and S5 (only indicate surrogate recoveries were outside of laboratory control limits). Please **immediately** upload to the State GeoTracker database a letter prepared by the laboratory indicating the impact of qualifiers S0 and S5 on the integrity and use of the laboratory results. Any unrepresentative results should be appropriately identified on future analytical tables by an appropriate footnote.

Unsolicited Workplan

GPP staff concur with the proposal to destroy MW-10 and install replacement well MW-10A. However, we do not concur with the proposal to screen MW-10A between 9 and 17 fbg. It appears MW-10A should be screened from 6 to 21 fbg based on the depth to groundwater reported in former MW-5, the PID screening and soil sampling results in Borings SB-6 and SB-7, and a comparison of the soil and groundwater sampling results from MW-6 and MW-13B. GPP staff are more concerned with adequately evaluating potential hydrocarbon impact to first groundwater than potentially spreading relatively low BTEX and MTBE concentrations a few feet deeper into strata having similar groundwater use and that are already impacted by PCE. Moreover, the PID screening and soil sampling results from SB-7, MW-6, and MW-13B do not suggest the silt logged in MW-5 at approximately 15 fbg is serving as a barrier to the vertical migration of fuel hydrocarbons. The following additional conditions apply to the proposed work:

- Install a monitoring well to assess first groundwater immediately southeast of SB-7 (a screen between pproximately 6 and 21 fbg appears reasonable);

- Collect a grab groundwater sample or install a monitoring well to assess first groundwater near MW-4 (the depth of the groundwater sample from SB-6 may have underestimated the fuel hydrocarbon impact to first groundwater);

- Collect grab groundwater samples at SB-5 and immediately east of Sample WO-1 to assess the PCE content of first groundwater and thedepth monitored by MW-13B;

- Screen the soil samples with an appropriate photoionization detector;

- Base the texture of well filter pack on the texture of the soil logged opposite the screened interval and also settle the filter prior to installing the bentonite seal;

- Upload to the State GeoTracker database by **May 2, 2012**, all electronic files required by California Code of Regulations Title 23, Division 3, Chapter 30, including a report detailing and justifying the methods, findings, conclusions, and recommendations of the investigation.

The report must indicate how investigative derived wastes were disposed and include scaled figures (base-10 preferred) and data analytical tables sufficient to support conclusions regarding contaminant extent, stability, and risk. It would be beneficial if at least one figure identified all sampling locations to date and the report included tables summarizing historical gauging data and the laboratory results of all soil, groundwater, and subsurface vapor sampling analyses performed to date (one table for soil, one for groundwater, and one for vapor is preferred). It would also be beneficial if each table indicated the date and depth of sample collection, as appropriate, and the proper field point name (FPN). FPNs must be consistent between text, figures, tables, and logs.

Please note, the UST Reimbursement Fund may not reimburse the cost to destroy MW-10, install MW-10A, and collect the grab groundwater samples near SB-5. This is because the initial work to perform these tasks did not satisfy the objective of the investigation.

Closing Comments

It is not necessary to name borings and wells by the FPN listed in the workplan. This leads to FPN gaps if the proposed borings/wells were not installed (e.g. SB-2 and MW-16B), which may confuse future reviewers of the file (i.e. they may think SB-2 and MW-16B were installed because site plans show borings or wells of greater number (SB-3 through SB-7 / MW-17B). Please consider naming borings and wells in a logical sequence when they are installed.

Please call me at (650) 372-6292 if you have any questions.

Subject: Re: ConocoPhillips 76 Station No. 6390, 402 S. Delaware, San Mateo (#110069) - permit approvals

If we signed off on a permit listing WDHC as the property owner, then we must have assumed WDHC was the property owner as listed on the permit. A recent check of the County Assessor database suggests WDHC may not be the property owner, so we cannot sign off until this issue is resolved..

Re: comment #1 below - Antea's statement is not applicable. The discussion deals with proposed SB-9; our referenced comment deals with assessment near MW-4.

Re: Comment #2 below - MW-4 does not appear appropriately screened to assess first gw (potential dilution concern based on logged stratigraphy, excessive well screen in the saturated zone, and the findings of your previous investigation). Our referenced comment gave you the option of installing an appropriately screened monitoring well near MW-4 (previously proposed MW-19) or a boring. We consider one or the other necessary.

Re: "Final" comment below - previously proposed SB-11 does not necessary at this time.

New GPP staff comment re: revised location of proposed MW-18 - the purpose of this well is to assess the impact of HC contamination that may be under the building at 521 5th Avenue. I highly recommend you move the proposed location ~20 feet south-southwest of the proposed location (next to offsite building). We already know gw at SB-7 is impacted and it does not really give us an idea of what is under the adjacent building.

Closing Comment - please do a better job of planning the execution of the work before applying for permits. It is not a efficient use of everyone's time to request permits to implement a scope of work, then request revisions to the scope of work a week or two later.

>>> "Dan Keltner" <Dan.Keltner@anteagroup.com> 3/8/2012 4:59 PM >>>
Mr. Milano,

Under separate cover, Antea Group will soon be re-submitting the Subsurface Drilling Permit Application for SB-8 at the referenced site #6390 in San Mateo. The revised permit will include proposed MW-18, which we will install next to SB-7 on the subject site, per your 2/23/12 email. We have contacted Western Dealer Holding Company (WDHC) regarding their relationship to this property. While the property is technically owned by Lucile Benedetti, it is our understanding that WDHC makes

decisions on behalf of the owner. We have asked that Shane Nolan provide further justification for WDHC signing as the property owner, and we will include that with the permit application. Please note that in 2011, GPP approved the on-site SB-7 and MW-17B permits, which listed WDHC as the property owner.

Also, please clarify the following with respect to your 11/22/11 letter's comment "*Collect a grab groundwater sample or install a monitoring well to assess first groundwater near MW-4 (the depth of the groundwater sample from SB-6 may have underestimated the fuel hydrocarbon impact to first groundwater)*":

1. We concur with sampling first-encountered groundwater at or near SB-6 (proposed SB-9). SB-9 would best be located at a location between SB-6, MW-4, and MW-10, but due to subsurface utilities at the NE side of Delaware Street, it's not feasible to locate SB-9 much further downgradient of SB-6. We will attempt to install SB-9 at the location shown on the attached map, but it may be moved nearer SB-6 due to utilities. Proposed MW-10R and SB-10 (see map) will also help to define hydrocarbons in groundwater downgradient of the site.
2. The referenced comment indicates you would like a sample or well near MW-4, which is an existing well screened from 7 to 27' that is assessing first groundwater (MW-4 is not significantly impacted by hydrocarbons). Although we included proposed MW-19 next to MW-4 on our 2/20/12 permit application, we believe this well is not necessary based on the appropriately screened interval of MW-4 to assess first groundwater at that location. Please confirm that assessing first groundwater at proposed SB-9 and SB-10 (see attached site plan), is adequate to address the 11/22/11 comment shown above.

Finally, regarding the permitting of SB-10 and SB-11 per our application submitted 2/20/12, we are now proposing only one grab sample at the SW corner of of the intersection of E. 5th and S. Delaware Streets (SB-10, per the attached map). We recognize that this testing location was not requested by GPP, but upon further review of the hydrocarbon impacts at SB-6 and SB-7, we would like to assess the downgradient extent of the hydrocarbon plume in first groundwater at a location nearer residential parcel #033-283-470 to fill in the gap between SP2 and SP7. Both SP2 (1996) and SP7 (2006) showed no hydrocarbon impacts in groundwater.

Upon our submittal and GPP approval of the on-site boring/well permit, we anticipate field work to begin in one mobilization in late March or early April. We will provide you proper notification at that time. Please contact me or Doug Umland if you have any questions.

Appendix B

Site Setting and Summary of Previous Environmental Investigations

SITE LOCATION AND BACKGROUND

The site is currently an active "76"-branded service station. The station is located approximately one mile west of San Francisco Bay in San Mateo, California, at an elevation of approximately 20 feet above mean sea level. The site facilities include two fuel underground storage tanks (USTs) located in a common pit in the southeast portion of the property, three product dispenser islands, and a station building. The USTs were installed at the site in August 1992 during station upgrade activities. A 550-gallon waste oil UST formerly located behind the station building was removed from the site in 1992.

The site is bounded to the northeast by South Delaware Street and a Jiffy Lube facility (407 South Delaware Street), to the northwest by East Fourth Street and commercial buildings, to the southwest by a parking lot for a Taco Bell restaurant (500 East 4th Avenue), and to the to the southeast by a Legal Aide of San Mateo building (521 South Delaware Street) and parking area.

There are seven existing or former gasoline service stations within ¼-mile of the site area. The site is located in a mixed commercial and residential area. The nearest residences are southwest of the site at 411 South Claremont, or approximately 50 feet southwest of the site, and an apartment building is located at 603 East 5th Avenue approximately 75 feet northeast of the site.

SUMMARY OF PREVIOUS ENVIRONMENTAL INVESTIGATIONS

In August 1992, Kaprealian Engineering, Inc. (KEI) observed the removal of two 12,000-gallon, fiberglass, gasoline underground storage tanks (USTs), one 550-gallon waste oil UST, and the associated product piping and dispensers. Upon removal of one of super unleaded gasoline UST, a 9-inch long crack was observed along its eastern end. Petroleum hydrocarbon contamination was observed at the eastern end of the gasoline UST cavity. The cavity was over-excavated to remove as much of the impacted soil as possible, resulting in a final excavation that measured approximately 30' by 27' by 22' deep. Initially, six soil samples (A1, A2, B1, B2, SW1, and SW2) were collected from the bottom and sidewalls of the UST cavity, one soil sample (WO1) was collected from the bottom of the waste oil UST cavity, and six soil samples (P1, P2, P3, P4, P5, and P6) were collected from the bottom of the product piping trenches.

At a later date, KEI collected an additional three soil samples (SW1, SW2, and SW3) from the gasoline UST cavity, along with a grab groundwater sample (W1). The water sample was collected after a total of approximately 5,800 gallons of water had been pumped form the gasoline UST cavity. The groundwater was observed to have floating product and a heavy sheen. Additionally, KEI collected three soil samples (D1, D2, and D3) from beneath the gasoline dispensers. Laboratory analyses of soil samples collected from the gasoline UST cavity reported relatively high levels of total petroleum hydrocarbons as gasoline (TPHg) benzene, toluene, ethylbenzene, and total xylenes (BTEX compounds), and total petroleum hydrocarbons as diesel (TPHd). The requested petroleum hydrocarbon constituents were not reported above laboratory detection limits in the soil samples collected from the product piping trenches and from beneath the gasoline dispensers. Laboratory analysis of the soil sample from the waste

oil UST indicated the presence of the heavy metals cadmium, chromium, nickel, lead and zinc, while the remaining petroleum hydrocarbon constituents were not indicated at concentrations above the laboratory detection limits. High levels of TPHd, TPHg, and BTEX compounds were also reported in the groundwater sample.

In May 1994, KEI installed three monitoring wells (MW-1, MW-2 and MW-3) at the site. Laboratory analyses of the soil samples collected from the borings for monitoring wells MW-2 and MW-3 indicated the presence of TPHg and BTEX compounds. The requested petroleum hydrocarbon constituents were not reported above laboratory detection limits in the soil samples collected form the MW-1 borehole. The wells were initially gauged and sampled in June 1994. Laboratory analyses of the water samples collected from MW-2 and MW-3 reported the presence of petroleum hydrocarbons in MW-2 and MW-3. The depth to water ranged from 15.33 to 16.71 feet below ground surface (bgs) with a groundwater gradient reported at 0.004 foot/foot to the east. KEI concluded to follow a three-month (quarterly) monitoring program.

In March 1995, two additional monitoring wells (MW-4 and MW-5) were installed at downgradient, off-site locations in the sidewalk along the opposite side of South Delaware Street from the site. Laboratory analyses of the soil samples collected from the monitoring well boreholes indicated the presence of TPHg and BTEX contamination in MW-4. The new wells were added to the quarterly groundwater monitoring program and were first sampled in April 1995. Laboratory analyses of the water samples collected from MW-4 and MW-5 indicated the presence of maximum concentrations of 150,000 micrograms per liter (µg/L) TPHg, 12,000 µg/L benzene, 40,000 µg/L toluene, 4,700 µg/L ethylbenzene, and 31,000 µg/L total xylenes reported in MW-4.

In January 1996, GeoStrategies (GSI) observed the excavation and removal of a 150 gallon capacity oil/water separator. A confirmation soil sample (OWS-S-4.5) was collected from underneath the oil/water separator at a depth of 4.5 feet bgs. Laboratory analysis of the sample indicated the presence of trace concentrations of TPHd, toluene, and total xylenes. Additionally, the presence of the heavy metals chromium, nickel, lead, and zinc were indicated at concentrations of 160 milligrams per kilogram (mg/kg), 99 mg/kg, 13 mg/kg, and 69 mg/kg, respectively. Tetrachloroethylene (PCE) and other chlorinated solvents were not present in the soil sample.

In February 1996, KEI supervised the advancement of three Geoprobe® soil borings (SP1, SP2, and SP4) at off-site locations. The soil borings were terminated at a depth of 13 feet bgs, with groundwater encountered at approximately 10.5 feet bgs. Grab groundwater samples were collected from each borehole. Laboratory analyses of the water samples reported low to moderate levels of TPHg, benzene, ethylbenzene, and total xylenes in the sample from boring SP-4. Petroleum hydrocarbon constituents were not reported above laboratory detection limits in the groundwater samples from borings SP-1 and SP-2.

In June 1996, Pacific Environmental Group, Inc. (Pacific) performed a well survey and reviewed California Department of Water Resources (DWR) well records. Four documented wells were identified within a ¼-mile radius of the site.

In December 2006 and January 2007, SECOR supervised the following activities: advancement of four direct push soil borings (SP-5 through SP-8), the installation of three soil vapor wells (VP-1 through VP-3) and four additional groundwater monitoring wells (MW-6 through MW-9), and the destruction of four groundwater monitoring wells (MW-1, MW-2, MW-3, and MW-5). Laboratory analyses of soil samples collected indicated the presence of up to 1,300 mg/kg total purgeable petroleum hydrocarbons (TPPH, MW-6@16.5-17), 0.18 mg/kg benzene (MW-6@11-11.5), 32 mg/kg toluene (MW-6@11-11.5), 20 mg/kg ethylbenzene (MW-6@11-11.5), 110 mg/kg total xylenes (MW-6@11-11.5), and 0.089 mg/kg methyl tertiary butyl ether (MTBE, MW-6@19.5-20). Grab groundwater sample analytical results indicated the presence of up to 51,000 µg/L TPPH (SP-8), 1,300 µg/L benzene (SP-5), 1,500 µg/L toluene (SP-5), 3,000 µg/L ethylbenzene (SP-8), 9,600 µg/L total xylenes (SP-8), and 330 µg/L MTBE (SP-5). Groundwater samples from MW-6 and MW-9 reported petroleum hydrocarbons. Laboratory analyses of the soil vapor samples indicated the presence of up to 0.75 micrograms per liter (µg/L) TPPH (VP-3), up to 16 µg/L toluene (VP-1), 14 µg/L ethylbenzene (VP-3), 42 µg/L m,p-xylenes (VP-3), and 29 µg/L o-xylenes (VP-3).

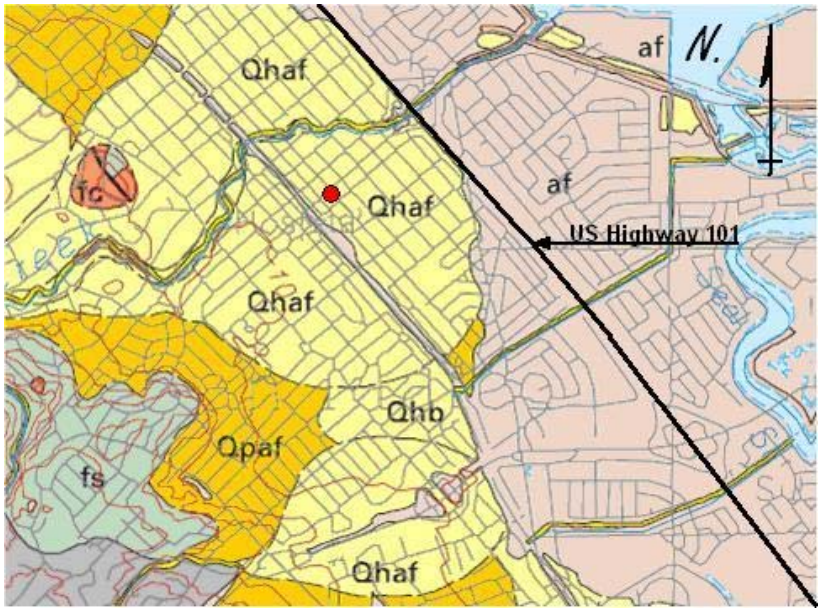
Based on the results of this investigation, SECOR concluded that hydrocarbons in soil had been adequately delineated, the lateral extent of hydrocarbons in groundwater had been delineated up-gradient and cross-gradient, the lateral extent of hydrocarbons in deeper groundwater had been delineated to the southwest (cross-gradient) by SP-7, and that vapor inhalation did not appear to be an exposure pathway at the site. SECOR recommended installation of a downgradient well in the shallow water bearing zone and downgradient wells in the deeper water bearing zone along East Fifth Avenue and Delaware Street, and to the northwest and northeast (up and cross-gradient) of the site. SECOR recommended groundwater analyses and historical research to identify the possible source of tetrachloroethylene (PCE) in groundwater.

In August 2008, Stantec oversaw the installation of two shallow groundwater monitoring wells (MW-10 and MW-11), and four deeper zone wells (MW-12B, MW-13B, MW-14B, and MW-15B) at locations down-gradient of the subject site. This included the collection of both soil and groundwater samples from the new wells. Stantec also completed a sensitive receptor survey (SRS) as part of this investigation. Stantec concluded that petroleum hydrocarbon plumes in groundwater had been delineated by the new wells, but recommended continued semiannual groundwater monitoring. No additional evaluation of sensitive receptors was recommended based on findings of the SRS (where no sensitive receptors were identified in the immediate down-gradient direction of the site).

Between 2009 and 2010, Delta Consultants has prepared an investigation work plan to assess the PCE contamination in groundwater in the vicinity of the site. Following submittal of a *Potential Source Evaluation and Tetrachloroethene (PCE) Source Evaluation Revised Work Plan on October 29, 2010,* Delta is awaiting approval from the lead oversight agency before implementing the work plan, which includes additional soil and groundwater testing at on and off-site locations in order to identify whether the subject site is a source of PCE contamination in groundwater, or if that contamination has originated from elsewhere.

In February 2011, Antea Group (formerly Delta Consultants) received conditional approval from the lead oversight agency, San Mateo County GPP, of their October 29, 2010 submittal titled *Potential Source Evaluation and Tetrachloroethene (PCE) Source Evaluation Revised Work Plan.*

Between May and June 2011, Antea Group oversaw the installation of one additional groundwater monitoring well MW-17B, and the advancement of six soil borings SB-1 and SB-3 through SB-7 to assess the potential up-gradient presence of PCE in soil and groundwater, as well as to further quantify the degree and extent of on-site and downgradient hydrocarbon contamination associated with the subject site. Details of the investigation are presented in the July 2011 *Potential Tetrachloroethylene (PCE) Source Investigation Report*.



In April and May 2012, Antea Group completed additional delineation of gasoline contaminants in groundwater to the east and southeast of the USTs, as well as the determining whether or not the subject site is a likely contributor to the PCE contaminant plume present in the regional groundwater. Antea Group oversaw the installation of soil borings SB-8 and SB-9, temporary well TW-1, and monitoring wells MW-18 and MW-19. Also, Antea Group oversaw the destruction of shallow well MW-10, replaced with new well MW-10R at a deeper screened interval.

SITE SETTING

Regional Geologic Setting

The site is located on an alluvial plain extending from the Santa Cruz Mountains to the east to the San Francisco Bay. The geologic map of the vicinity below shows that the site is underlain by alluvial fan and fluvial deposits (Qhaf). Near the edge of San Francisco Bay, the deposits consist of medium dense sands that fine upward to sandy or silty clay (E.E. Brabb, et al., 1998). Other deposits in the area are heterogeneous artificial fill (af) and basin

Geologic Map of Vicinity

GEOLOGY OF THE ONSHORE PART OF SAN MATEO COUNTY, CALIFORNIA: DERIVED FROM THE DIGITAL DATABASE OPEN-FILE 98-137

deposits (Qhb) consisting of fine silty clay to clay deposits.

Regional Hydrogeologic Setting

The site is located within the Santa Clara Valley groundwater basin and South Bay hydrologic planning area. Groundwater throughout the area flows typically northeasterly, originating in the Santa Cruz Mountains to the west and flowing towards San Francisco Bay. The basin is composed of alluvial fan deposits formed by tributaries to San Francisco Bay. The water-bearing formations comprise two groups; the Santa Clara Formation of the older Plio-Pleistocene age and the Quaternary age alluvial deposits. The shallow alluvial deposits overlie the Santa Clara Formation and have a maximum depth of about 1,250-feet.

Quaternary age alluvium consists of sand, gravel, silt, and clay deposits that are about 100-feet thick and average about 60-feet thick. The Pliocene age San Mateo Formation consists of deposits of marine sand, gravel, silt, and clay, which are locally water-bearing (DWR 2003).

The prominent groundwater flow direction is to the east.

Stantec conducted a sensitive receptor survey within a ½-mile of the site between July 2008 and August 2008 (Stantec 2008). A detailed parcel survey was performed at a 500-foot radius surrounding the site. The parcel survey identified 12 properties with basements, two properties with a sump, and no properties with groundwater wells within the 500-foot radius. A field canvas by Stantec did not identify groundwater production wells, or accompanying facilities associated with groundwater production wells within the search radius. In addition, California Water Service Company, the primary water provider for the area, indicated that they did not have any water supply wells within ½-mile boundary of the survey area.

There is one surface water body identified within the limits of the ½ -mile survey. San Mateo Creek is located approximately 1,488-feet north of the site.

Appendix C

Standard Operating Procedures

STANDARD OPERATING PROCEDURES

Utility Locating

Prior to drilling, boring and excavation locations and an approximate 15-foot by 15-foot box are marked with white paint or other distinct marking and cleared for underground utilities through Underground Service Alert (USA). In addition, Antea Group will contract an independent locator services to clear boring or excavation locations of subsurface assets. The first five feet (or more in instances where utilities are suspected in close proximity) of each borehole are air-knifed, or carefully advanced with a hand auger if shallow soil samples are necessary, to help evaluate the borehole location for underground structures or utilities in accordance with Antea Group's subsurface hazard avoidance policy.

Subsurface Investigation Methods – GeoProbe®, Sonic, Hollow Stem Auger Drilling, Sampling, and Borehole Completion

Borehole Advancement using GeoProbe® (Single wall and dual tube)

Pre-cleaned push rods (typically one to two inches in diameter) are advanced using a hydraulic direct push-type rig for the purpose of collecting samples and evaluating subsurface conditions. The sample barrel located at the leading end of the drill rod serves as a soil sampler, and an acetate liner is inserted into the sample barrel rod prior to advancement of the push rod. Once the sample is collected, the rods and sampler are retracted and the acetate sample tubes are removed from the sampler. The sample barrel is then cleaned, filled with clean sample tubes, inserted into the borehole and advanced to the next sampling point where the sample collection process is repeated. This process differs with the use of Dual Tube drilling, where an outer rod is pushed with the sample rod, and only the sample rod is retracted. This process assures that the borehole remains open during drilling, thereby minimizing cave-ins within the borehole.

Undisturbed soil samples selected for laboratory analysis are cut away from the acetate sample liner using a hacksaw, or equivalent tool, in sections approximately 6 inches in length. The 6 inch samples are lined at each end with Teflon® sheets and capped with plastic caps. Labels documenting project number, borehole identification, collection date, and depth are affixed to each sample. The samples are then placed into an ice-filled cooler for delivery under chain-of-custody to a laboratory certified by the State of California for analysis. The remaining collected soil that has not been selected for laboratory analysis is logged using the United Soil Classification System (USCS) under the direction of a State Registered Professional Geologist, and is field screened for organic vapors using a photo ionization detector (PID), or an equivalent tool. To collect a PID reading, A portion of each liner was placed in a gloss jar and sealed with a disposable tin foil top. After approximately ½-hour, the sampling tube of a PID was inserted into the jar through the foil top. The stabilized PID readings were recorded on the well boring logs

Borehole Advancement using Sonic Drilling

Pre-cleaned heavy-walled down-hole casings (typically 6 to 8 inches in diameter) are advanced using a sonic head. A smaller diameter core barrel (typically 4 to 6 inches in diameter) is advanced through the inside of the down-hole casings to remove the soil cuttings from the borehole for sample collection and evaluation of subsurface conditions.

During drilling, soil samples are collected continuously using the sonic core barrel. A physical description of soil

characteristics (i.e. moisture content, consistency or density, odor, color, and plasticity), drilling difficulty, and soil type as a function of depth are described on boring logs. The soil cuttings are classified in accordance with the USCS and field screened for organic vapors using a PID.

Borehole Advancement using Hollow Stem Auger

Pre-cleaned hollow stem augers (typically 8 to 10 inches in diameter) are advanced using a drill rig for the purpose of collecting samples and evaluating subsurface conditions. A pre-cleaned split spoon sampler is lined with three 6-inch long brass or stainless steel tubes and attached to the drill rods. The sampler is then driven 18 inches into the underlying soils at the target sample interval by repeatedly dropping a 140-pound hammer over a 30-inch free fall distance. The number of blow counts to drive the sampler each 6-inch interval of sampler advancement are recorded on the field logs. The sampler is driven 18 inches or until the sampler has met refusal (typically 50 blows per six inches), then the sampler is retrieved. Alternatively, soil samples are retrieved by driving the sampler using a pneumatic hammer, when using a limited access rig.

Generally the bottom sample tube is selected for laboratory analysis. The middle tube is extruded for logging and PID screening, and the top tube is considered slough caved off from the sides of the boring prior to sampling.

The retained sample is carefully packaged for chemical analysis by capping each end of the sample with a Teflon sheet followed by a tight-fitting plastic cap and stored in a zip-type plastic bag. A label is affixed to the sample indicating the sample identification number, borehole number, sampling depth, sample collection date, and job number. The sample is then annotated on a chain-of-custody form and placed in an ice-filled cooler for transport to the laboratory.

During the drilling process, a physical description of the encountered soil characteristics (i.e. moisture content, consistency or density, odor, color, and plasticity), drilling difficulty, and soil type as a function of depth are described on boring logs. The soil cuttings are classified in accordance with the USCS.

Grab Groundwater Sample Collection

Once the target groundwater sampling depth has been reached, a groundwater sample is collected by inserting a temporary 1-inch schedule 40 PVC casing with a 5-foot screened interval with a pre-attached filter pack into the borehole. The screened interval is placed from at the total depth of the boring. Groundwater is allowed to temporarily stabilize, and grab samples are collected using a peristaltic pump.

Collected water samples are decanted directly into laboratory provided, pre-cleaned, vials or containers and sealed with Teflon-lined septum, screw-on lids. Labels documenting sample number, well identification, collection date, and type of preservative (if applicable, i.e. HCl for GRO, BTEX, and fuel oxygenates) are affixed to each sample. The samples are then placed into an ice-filled cooler for delivery under chain-of-custody to a laboratory certified by the State of California to perform the specified tests.

Borehole Completion

Upon completion of drilling and sampling, the inner casing rods are retracted. Neat cement grout, mixed at a ratio of 6 gallons of water per 94 pounds of Portland cement, is introduced via a tremie pipe to displace standing water in the borehole, through the annulus of the outer casing rods. The outer rods are retracted as the grout is introduced to bottom of the boring to prevent the cross contamination of encountered water bearing zones. Displaced groundwater is collected at the surface and placed into DOT approved 55-gallon steel drums, or an equivalent storage container. In areas where the borehole penetrates asphalt or concrete, the borehole is capped with an equivalent thickness of asphalt or concrete patch to match finished grade.

Well Construction (typical)

Selected borings will be converted to groundwater monitoring wells by the installation of 2-inch diameter Schedule 40 polyvinyl chloride well casing with 0.020-inch factory slotted well screen as stated in the body of the work plan. A filter pack of Monterey #3 grade sand (or equivalent) will be placed in the annular space of the monitoring well borings, extending from the bottom of each well casing to approximately 1-foot above the top of the screened casing. A sanitary seal consisting of a 2-foot bentonite will be placed on above the filter sand and charged with water to create a seal. Neat cement grout, mixed at a ratio of 6 gallons of water per 94 pounds of Portland cement, is introduced via a tremie pipe to displace standing water in the well annulus bentonite to within two feet of the ground surface. Antea Group will install a minimum of a 5-foot annual seal. A traffic-rated well box will be installed on each well to protect and finish the well to surface grade.

Well Development

Groundwater monitoring wells will be allowed to stabilize for a minimum of 72 hours after installation prior to development. During development, wells are surged and purged of approximately 10 casing volumes. After each purged volume (or other stated purge volume) measurements of pH, temperature, electric conductivity (E.C.), turbidity, dissolved oxygen (DO) and total dissolved solids (TDS) are recorded. Following development, the wells will be allowed stabilize for a minimum of 48 hours prior to the collection of any groundwater samples.

Well Gauging

Wells are inspected prior to evacuation and sampling. The condition of the wellhead is checked and noted according to a wellhead inspection checklist. Standard measurements include the depth to water (DTW) and the total well depth (TD) obtained with industry standard electronic sounders which are graduated in increments of hundredths of a foot. The water in each well is inspected for the presence of Immiscibles or sheen and when free product is suspected, it is confirmed using an electronic interface probe (e.g. MMC). No samples are collected from a well containing free product.

Well Purging

Depth to water measurements are collected prior to purging and minimum purge volumes are calculated anew for each well based on the height of the water column and the diameter of the well. Expected purge volumes are never less than three case volumes and are set at no less than four case volumes in some jurisdictions. Well purging devices are selected on the basis of the well diameter and the total volume to be evacuated. In most cases the well will be purged using an

electric submersible pump (i.e. Grundfos) suspended near (but not touching) the bottom of the well. Small volumes of purgewater are often removed by hand bailing with a disposable bailer.

Well purging completion standards include minimum purge volumes, but additionally require stabilization of specific groundwater parameters prior to sample collection. Typical groundwater parameters used to measure stability are electrical conductivity, pH, and temperature. Instrument readings are obtained at regular intervals during the evacuation process (no less than once per case volume). Stabilization standards for routine quarterly monitoring of fuel sites include the following: Temperature is considered to have stabilized when successive readings do not fluctuate more than +/- 1 degree Celsius. Electrical conductivity is considered stable when successive readings are within 10%. pH is considered to be stable when successive readings remain constant or vary no more than 0.2 of a pH unit.

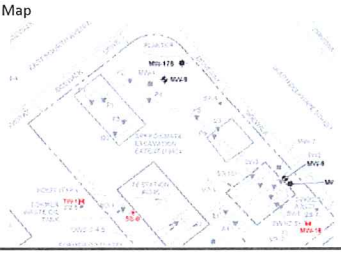
Prior to sampling, wells are left to recharge to at least 80% the initial water column height. Groundwater samples are collected with a disposable bailer.

Equipment Decontamination

Equipment that could potentially come in contact subsurface media and compromise the integrity of the samples is carefully decontaminated prior to drilling and sampling. Drilling auger and other large pieces of equipment are decontaminated using high pressure hot water spray. Soil and groundwater sampling apparatus, groundwater pumps, liners and other equipment are decontaminated in an Alconox scrub solution and double rinsed in clean tap water rinse followed by a final distilled water rinse.

The rinsate and other wastewater are contained in 55-gallon DOT-approved drums, labeled (to identify the contents, generation date and project) and stored on-site pending waste profiling and disposal.

Waste Handling and Disposal *(Soil Cuttings and Rinsate/Purge Water)*



Soil cuttings and rinsate/purge water generated during drilling and sampling are stored on-site in DOT-approved 55-gallon steel drums pending characterization. A label is affixed to the drums indicating the contents of the drum, suspected contaminants, date of generation, and the boring number from which the waste is generated. The drums are removed from the site by a licensed waste disposal contractor to an appropriate facility for treatment/recycling.

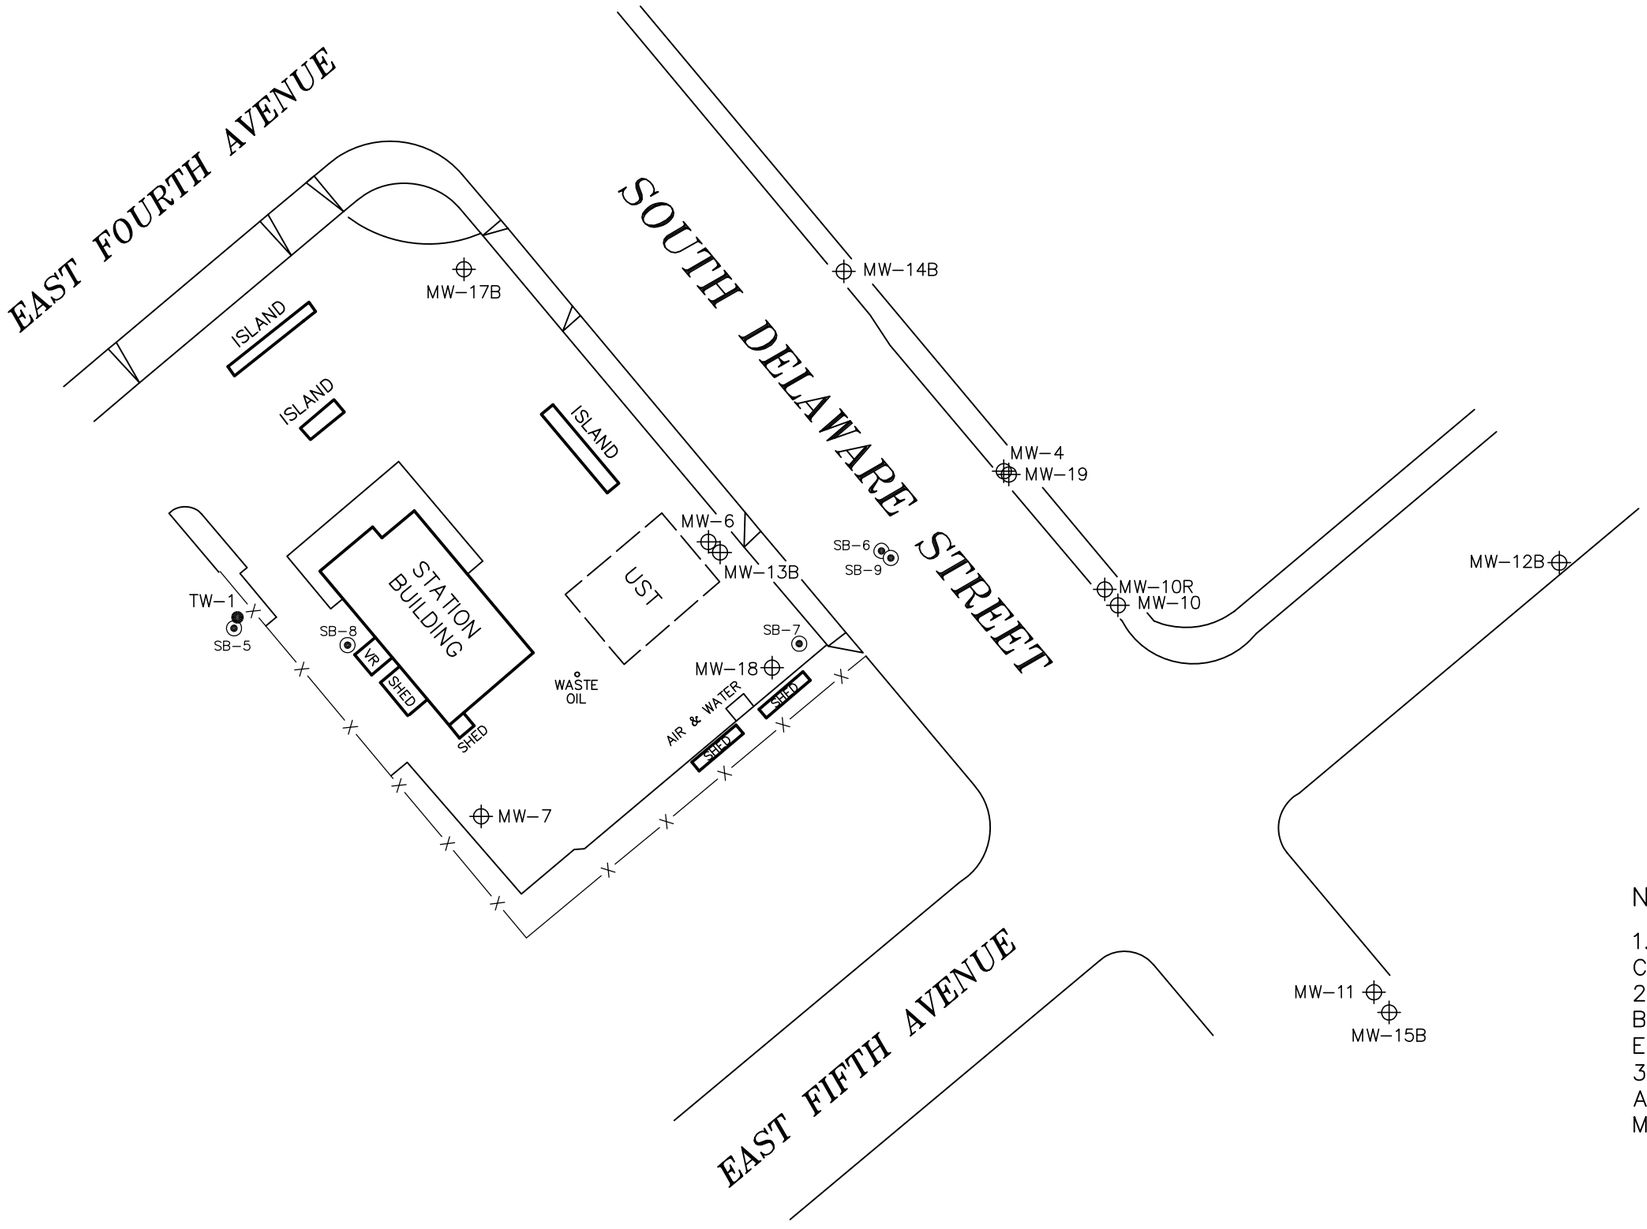
Re: **76 Service Station No. 6390, 402 South Delaware Street, San Mateo, California;** Antea Project No. I40256390, MCE Job No. 08119X2

Dear Mr. Corley,

As you requested, on May 25 we surveyed three monitoring wells, five soil borings and a temporary well located at the referenced site. Our findings are shown on the attached sheets, expressed in State Plane Coordinates and Latitude/Longitude, and are consistent with our previous surveys of August 18, 2008 for Stantec and of June 6, 2011 for Antea.

For the monitoring wells a notch was cut in the north rim of the PVC casing (toc) and a cross chiseled in the north rim of the standard box (tob). Measurements for the temporary well were taken at the top center of the box. The soil borings were measured at the approximate center of the grout.

Measurements were obtained from conventional survey techniques in combination with GPS techniques (Code CGPS), using data for MW-4 TOC and MW-7 TOC reported to GeoTracker from surveys by Morrow Surveying dated 8/13/2005 and 12/19/2006.



The benchmark used for this survey is the TOC of MW-7 as described above and reported by Morrow Surveying. Elevation = 21.74 feet, reported to be NAVD 88 datum.

Please let me know if you have questions or need additional information.

Yours truly,

Lee D. Vaage

NOTES:

1. COORDINATES ARE BASED ON THE CALIFORNIA COORDINATE SYSTEM, ZONE III, NAD 83.
2. BENCHMARK IS TOC MW–7 FROM A SURVEY BY MORROW SURVEYING DATED 1/16/2007. ELEVATION = 21.74, NAVD 88 DATUM.
3. SURVEYED AT THE REQUEST OF STANTEC IN AUGUST 2008 AND ANTEA IN JUNE 2011 AND MAY 2012, PROJECT NO. 140256390.

Certified Laboratory Analytical Reports

KIFF Analytical LLC

Report Number : 81304
Date : 06/29/2012

Laboratory Results

Dan Keltner
Antea Group
312 Piercy Rd.
San Jose, CA 95138

Subject : 6 Soil Samples and 1 Water Sample
Project Name : 76 SERVICE STATION NO. 256390
Project Number : I40256390
P.O. Number : I40256390

Dear Mr. Keltner,

Chemical analysis of the samples referenced above has been completed. Summaries of the data are contained on the following pages. Sample(s) were received under documented chain-of-custody. US EPA protocols for sample storage and preservation were followed. Testing procedures comply with the 2003 NELAC and TNI 2009 standards. Laboratory results relate only to the samples tested. This report may be freely reproduced in full, but may only be reproduced in part with the express permission of Kiff Analytical, LLC. Kiff Analytical, LLC is certified by the State of California under the National Environmental Laboratory Accreditation Program (NELAP), lab # 08263CA. If you have any questions regarding procedures or results, please call me at 530-297-4800.

Sincerely,

Troy G. Turpen

Troy Turpen

KIFF Analytical LLC

Report Number : 81304
Date : 06/29/2012

Subject : 6 Soil Samples and 1 Water Sample
Project Name : 76 SERVICE STATION NO. 256390
Project Number : I40256390
P.O. Number : I40256390

Case Narrative

All soil samples were reported on a total weight (wet weight) basis.

The Method Reporting Limit for Styrene has been increased due to the presence of an interfering compound for sample MW-18_d19.5.

A version of this report was previously issued on 05/24/2012. This revised version replaces that report.

KIFF Analytical LLC

P.O. Number : I40256390

Dear Mr. Keltner,

Chemical analysis of the samples referenced above has been completed. Summaries of the data are contained on the following pages. Sample(s) were received under documented chain-of-custody. US EPA protocols for sample storage and preservation were followed. Testing procedures comply with the 2003 NELAC and TNI 2009 standards. Laboratory results relate only to the samples tested. This report may be freely reproduced in full, but may only be reproduced in part with the express permission of Kiff Analytical, LLC. Kiff Analytical, LLC is certified by the State of California under the National Environmental Laboratory Accreditation Program (NELAP), lab # 08263CA. If you have any questions regarding procedures or results, please call me at 530-297-4800.

Sincerely,

Troy G. Turpen

Project Number : I40256390
P.O. Number : I40256390

Case Narrative

All soil samples were reported on a total weight (wet weight) basis.

The Method Reporting Limit for Styrene has been increased due to the presence of an interfering compound for sample SB-9_W.

Matrix Spike/Matrix Spike Duplicate results associated with sample SB-9_W for the analyte Benzene were affected by the analyte concentrations already present in the un-spiked sample.

A version of this report was previously issued on 04/19/12. This revised version replaces that report.

Matrix Spike/Matrix Spike Duplicate results associated with samples MW-10R_d18.5 and MW-19_d18.0 for the analyte Ethanol were outside of control limits. This may indicate a bias for the sample that was spiked. Since the LCS recoveries were within control limits, no data are flagged.

Matrix Spike/Matrix Spike Duplicate results associated with sample SB-9_W for the analyte Ethanol were outside of control limits. This may indicate a bias for the sample that was spiked. Since the LCS recoveries were within control limits, no data are flagged.

SAMPLE RECEIPT CHECKLIST

RECEIVER: Initials

SRG#: 80993 Date: 041312

Project ID: 76 Station #6390

Method of Receipt: ☑ Courier ☐ Over-the-counter ☐ Shipper

COC Inspection

Is COC present?	☑ Yes	☐ No		
Custody seals on shipping container?	☐ Intact	☐ Broken	☐ Not present	☑ N/A
Is COC Signed by Relinquisher? ☑ Yes ☐ No Dated?	☑ Yes	☐ No		
Is sampler name legibly indicated on COC?	☐ Yes	☑ No		
Is analysis or hold requested for all samples?	☑ Yes	☐ No		
Is the turnaround time indicated on COC?	☑ Yes	☐ No		
Is COC free of whiteout and uninitialed cross-outs?	☑ Yes	☐ No, Whiteout	☐ No, Cross-outs	

Sample Inspection

Coolant Present: ☑ Yes ☐ No (includes water)

Temperature °C 3.7 Therm. ID# IR-4 Initial CAG Date/Time 041312 1447 ☐ N/A

Are there custody seals on sample containers?	☐ Intact	☐ Broken	☑ Not present	
Do containers match COC? ☑ Yes ☐ No ☐ No, COC lists absent sample(s)	☐ No, Extra sample(s) present			
Are there samples matrices other than soil, water, air or carbon?	☐ Yes	☑ No		
Are any sample containers broken, leaking or damaged?	☐ Yes	☑ No		
Are preservatives indicated? ☐ Yes, on sample containers	☑ Yes, on COC	☐ Not indicated	☐ N/A	
Are preservatives correct for analyses requested?	☑ Yes	☐ No	☐ N/A	
Are samples within holding time for analyses requested?	☑ Yes	☐ No		
Are the correct sample containers used for the analyses requested?	☑ Yes	☐ No		
Is there sufficient sample to perform testing?	☑ Yes	☐ No		

Does any sample contain product, have strong odor or are otherwise suspected to be hot? ☐ Yes ☑ No

Receipt Details

Matrix WA	Container type Voa	# of containers received 06
Matrix So	Container type Sleeve	# of containers received 02

RE: Project: 256390
Pace Project No.: 2512399

Dear Doug Umland:
Enclosed are the analytical results for sample(s) received by the laboratory on May 31, 2012. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Karen Jang

QUALIFIERS

Project: 256390
Pace Project No.: 2512399

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PRL - Pace Reporting Limit.

RL - Reporting Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel Clean-Up

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

LABORATORIES

PASI-S	Pace Analytical Services - Seattle

ANALYTE QUALIFIERS

CH	The continuing calibration for this compound is outside of Pace Analytical acceptance limits. The results may be biased high.
D6	The relative percent difference (RPD) between the sample and sample duplicate exceeded laboratory control limits.
E	Analyte concentration exceeded the calibration range. The reported result is estimated.
M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
S5	Surrogate recovery outside control limits due to matrix interferences (not confirmed by re-analysis).

Additional Soil and Groundwater Investigation Report

76 Service Station No. 6390
402 South Delaware Street
San Mateo, California

1.0 INTRODUCTION

Antea®Group has prepared this *Additional Soil and Groundwater Investigation Report* for the 76 Service Station located at 402 South Delaware Street in San Mateo (the site, **Figure 1**). This investigation was originally proposed in Antea Group's *Additional Groundwater and Vapor Investigation Work Plan* dated September 7, 2012, which was conditionally approved in a letter dated January 29, 2013 from the San Mateo County Groundwater Protection Program (GPP) (**Appendix A**). This report documents the following:

- Installation of five additional groundwater monitoring wells (MW-20 through MW-24);
- Advancement of soil boring SB-10 (added to the work scope by Antea Group to analyze for the presence of naphthalene, and approved by GPP in email correspondence dated May 22, 2013);
- Advancement of soil boring SB-11 (adjacent to final location of well MW-24);
- Destruction of well MW-11 (recommended by GPP in email correspondence dated February 21, 2013).

The purpose of the investigation was to evaluate potential site source contribution to the regional tetrachloroethane (PCE) plume, optimize offsite well screening, abandon a dry well, and gather naphthalene data in support of State Water Resources Control Board Resolution No. 2012-0016 (SB 2012-0016).

A vapor study proposed by Antea Group in the September 7, 2012 work plan has been modified per GPP recommendations (**Appendix A**), and will be reported under separate cover by May 30, 2014 following installation of four vapor probes and two seasonal sampling events.

1.1 Site Description

The site is currently occupied by an active 76 Service Station, located on the south corner at the intersection of East Fourth Avenue and South Delaware Street in San Mateo, California. The station is located approximately one mile west of San Francisco Bay at an elevation of approximately 20 feet above mean sea level (**Figure 1**). The site facilities currently include two fuel underground storage tanks (USTs) located in a common pit in the southeast portion of the property, three product dispenser islands, and a station building (**Figure 2**). The site is located on an alluvial plain extending from the Santa Cruz Mountains to the east to the San Francisco Bay within the Santa Clara Valley groundwater basin and South Bay hydrologic planning area. Please refer to **Appendix B** for a complete summary of the site location, geologic setting, and environmental history.

2.0 INVESTIGATION ACTIVITIES

On March 14 and 15, 2013, Gregg Drilling and Testing Inc. (Gregg Drilling), under the supervision of Antea Group, installed wells MW-20 and MW-21 in South Delaware Street and East Fifth Avenue, advanced boring SB-11 in East Fifth Avenue, and destroyed well MW-11 (**Figure 2**).

Due to delays in obtaining an access agreements/permit signatures for the installation of wells MW-22 and MW-23 and boring SB-10, these locations and well MW-24 were installed between June 25 and 29, 2013. Standard operating procedures (SOPs) for soil boring advancement, soil and groundwater sample collection and well installation are provided as **Appendix C**.

2.1 Pre Field Activities

Prior to initiation of field activities, Antea Group produced a Health and Safety Plan (HASP) in accordance with Title 8, Section 5192 of the California Code of Regulations. The HASP was reviewed daily by field personnel. Antea Group obtained all necessary subsurface drilling and encroachment permits from the GPP and the City of San Mateo (**Appendix D**). Antea Group pre-marked the site and drilling locations, contacted the Underground Service Alert (USA), and employed a private locator to clear each drilling location for subsurface obstructions and hazards. Borehole clearance activities were carried out as outlined in **Appendix C.**

2.2 Soil Borings

SB-11 was not completed as well MW-24, as groundwater was not encountered at 21 feet below ground surface (bgs) during advancement of the pilot borehole, and only seven inches of water were observed when the boring was advanced to 31 feet bgs. Antea Group collected a grab groundwater sample from 31 feet bgs and a field decision was made not to install MW-24; based on a later request by the GPP, Antea Group installed MW-24 adjacent to SB-11 during a second field mobilization (see **Section 2.3**).

Soil boring SB-10 was advanced using a hand auger to approximately 9.0 feet bgs, at which depth refusal was met due to the presence of rock wider than the borehole diameter.

2.3 Well Installations

Borings for wells were initially advanced using direct push soil sampling equipment for the purpose of lithologic descriptions and soil sample collection, and then overdrilled using 8-inch hollow stem auger drilling equipment, as described in **Appendix C**. Soil boring and monitoring well construction details are included in **Table 1**.

Wells MW-20, MW-21, MW-22 and MW-24 were screened from 6 to 21 feet bgs; well MW-23 was screened from 21 to 31 feet bgs. Well construction diagrams including annulus materials are presented on boring logs included as **Appendix E**.

Antea Group attempted to install MW-23 on June 26, 2013, initially; however a layer of coarse angular gravel was encountered at approximately 6 feet bgs, which did not appear to be native. Antea Group moved the location five feet away and started preclearance, however the same gravel layer was encountered. Due to safety concerns and time limit constraints associated with our access agreement, an air knife rig was brought to the site on June 29th to safely pass through the gravel layer, which ended at 10 feet, and well MW-23 was subsequently installed.

2.4 Monitoring Well Destruction

Well MW-11 was destroyed by pressure grout. Approximately 15 gallons of cement grout were poured into the bottom of the well through a tremmie pipe, after which a well cap was placed on the top of the well and a pressure of 25 pounds per square inch (psi) applied to the well for 15 minutes. The well cap was then removed and an additional three gallons of grout were poured into the well casing. Pressure was reapplied to the well for an additional 10 minutes, and no grout subsidence was noted when the cap was removed. The well vault was removed and the location was capped with concrete.

2.5 Soil Sampling

Soils from MW-20, MW-21, MW-22 and MW-24 were collected continuously in acetate liners. Due to time constraints associated with our access agreement, soil samples were collected for field screening purposes at 5 foot intervals in MW-23. Only soil samples from onsite boring SB-10 and onsite well MW-22 were retained for laboratory analysis in order to obtain a complete analytical profile. Soil sampling procedures are provided as **Appendix C**; soil observations are recorded on boring logs, which are included as **Appendix E**.

Soil samples were collected from SB-10 at depths of 3, 5 and 9 feet bgs to evaluate for site-specific closure eligibility under SB-2012 0016. Soil samples were collected from MW-22 at 2- to 5-foot intervals in direct-push acetate liners in order to confirm historical PCE concentrations and obtain high resolution PCE and naphthalene data.

Soil samples were properly labeled and immediately placed on ice in a cooler pending transportation to Kiff Analytical LLC (Kiff), a National Environment Laboratory Accreditation Program (NELAP) certified laboratory (Certificate #08263CA). Soil samples were analyzed for the following components:

- Gasoline Range Organics (GRO) by Environmental Protection Agency (EPA) Test Method 8260B;
- Benzene, toluene, ethylbenzene and xylenes (BTEX compounds), methyl tertiary butyl ether (MTBE), tertiary butyl alcohol (TBA), ethyl tertiary butyl ether (ETBE), diisopropyl ether (DIPE) 1,2-dichloro-ethane (1,2-DCA), ethylene dibromide (EDB) and naphthalene by EPA Test Method 8260B.
- Tetrachloroethane (PCE), trichloroethane (TCE), cis 1,2-Dichloroethene (cis 1,2-DCE), trans 1,2-Dichloro-ethene (trans 1,2-DCE) and vinyl chloride by EPA Test Method 8260B.

2.6 Groundwater Sampling

Blaine Tech Services (Blaine Tech) collected groundwater samples from wells MW-20 and MW-21 on May 20, 2013. With the exception of well MW-22, all new wells were included in the second quarter groundwater monitoring event completed by Blaine Tech on July 8, 2013. Samples from the new monitoring wells were submitted to the laboratory on a 24-hour turnaround time request; the remaining samples were submitted on a standard turnaround time, and those results be reported in the third quarter 2013 semi-annual monitoring report. Well MW-22 did not contain enough water to sample. Blaine Tech's SOPs for groundwater sampling are provided as **Appendix F** and well development and sampling documentation is presented as **Appendix G**.

Groundwater samples were properly labeled, immediately placed on ice in a cooler pending transportation to Kiff, and analyzed for the same analytical suite described in **Section 2.3**, with two exceptions: groundwater samples were analyzed for ethanol, and naphthalene was analyzed by EPA Test Method 8270 (May 20, 2013 event) by Calscience Environmental and Marine Chemistry Laboratories (Calscience), a state of California certified laboratory (#03220CA).

2.7 Well Development

On March 20, 2013, Gregg Drilling developed wells MW-20 and MW-21; well MW-23 was developed July 3, 2013 by Blaine Tech. The well screens were surged for 15 minutes, and a minimum of 10 casing volumes of groundwater were removed from the wells. During purging, pH, electric conductivity (EC), turbidity, dissolved oxygen (DO), temperature, salinity, pump rate and water level were measured and recorded on development logs, included as **Appendix G**.

Gregg Drilling attempted to develop wells MW-22 and MW-24 on July 1, 2013, however neither well contained sufficient water. Antea Group has directed Blaine Tech to continue gauging these wells, develop them should they contain enough water in the future, and collect grab groundwater samples when possible. All new wells have been added to the ongoing groundwater monitoring program.

2.8 Monitoring Well Survey

Licensed surveyor Morrow Surveying surveyed new monitoring wells MW-20 and MW-21 on May 16, 2013; wells MW-22, MW-23 and MW-24 were surveyed on July 1, 2013. Longitude and latitude were surveyed to North American Datum 83, and the top of casing well elevations were surveyed to North American Vertical Datum 88. Survey data has been included as **Appendix H.**

2.9 Results

Boring logs are provided as **Appendix E**, laboratory analytical reports with chain-of-custody documentation are presented as **Appendix I**, a summary of current soil analytical data is presented in **Table 2**, and groundwater analytical results from this investigation are summarized in **Table 3**.

2.9.1 Subsurface Conditions

Soils encountered in the site subsurface appear to be consistent with previously observed soils. In general, soils logged in borings consisted of sandy to gravelly clay and silt. An approximately 10-foot thick section of well graded gravel with silt and sand was encountered in the vicinity of MW-23 from five to 15 feet bgs, and appeared to be artificial fill. Saturated, well-graded sand was reported at 29.5 feet to the total depth of 31 feet in MW-23. A thin layer of dry, well-graded gravel was encountered at 20 feet bgs in MW-24.

During drilling, groundwater was encountered in MW-20 and MW-21 at approximately 20 feet bgs, and at 29 feet bgs in MW-24. Groundwater was not encountered during drilling or installation of MW-22 and MW-24. Groundwater flow direction calculated with the new wells is to the west at a hydraulic gradient of 0.001 feet per foot (ft/ft) to the west, which is consistent with the historically reported direction. A groundwater elevation map is provided on **Figure 3**.

2.9.2 Soil Analytical Results

PCE was reported in the 21-foot sample from MW-22 at a concentration of 0.0059 milligrams per kilogram (mg/kg). No other analytes were reported above laboratory reporting limits. A soil concentration map is presented on **Figure 4**.

2.9.3 Groundwater Analytical Results

Groundwater concentrations in MW-21 increased between May 20 and July 5, 2013. GRO increased from 3,400 micrograms per liter (µg/L) to 21,000 µg/L. Elevated concentrations of ethylbenzene, xylenes and naphthalene were also reported in MW-21. GRO was reported in wells MW-20 and MW-23 at concentrations below 200 µg/L, however these concentrations were qualified by the laboratory, which noted the primary compounds were not found in typical gasoline. Due to the presence of PCE in these samples, reported GRO concentrations are believed to be due to PCE.

During the July 8, 2013 sampling event, PCE was reported at a maximum concentration of 90 µg/L in up-gradient well MW-23 and in down-gradient well MW-20 at 53 µg/L and cross-gradient well MW-24 at 1.3 µg/L. PCE degradation compounds TCE and cis 1, 2-DCE were also reported in the same wells, with the exception of MW-24. PCE and associated compounds were not reported in MW-21.

The March 15, 2013 grab groundwater sample from SB-11 contained noticeably higher analyte detections than the July 8, 2013 groundwater sample from well MW-24. Since grab groundwater samples can be affected by interference sorbed-phase contaminants, Antea Group considers the sample from MW-24 to be more characteristic of actual groundwater conditions. Groundwater concentrations for new wells are presented on **Figure 5**.

2.10 Quality Assurance/ Quality Control (QA/QC)

Antea Group's QA/QC measures included use of a trip blank with the samples collected on May 20, 2013 and detailed QA/QC data validation all Kiff laboratory analytical reports. Antea Group's laboratory data validation checklist and the Kiff and Calscience laboratory reports with chain-of-custody documentation are included as **Appendix I** and summarized below.

Trip Blank (TB1_20130228):	No contaminants reported
Laboratory QA/QC Performed:	Yes (validated by Antea Group)
Laboratory Data Qualifiers:	Yes – four data qualifiers in total (see below)
Are the data valid for their intended purpose?	Yes, data are deemed valid

- Matrix Spike/Matrix Spike Duplicate (MS/MSD) results associated with sample SB-11 for the analyte Benzene were affected by the analyte concentrations already present in the un-spiked sample.
- The Method Reporting Limit for Ethanol has been increased due to the presence of an interfering compound for sample MW-21_20130531.
- MS/MSD results associated with samples MW-21_20130731 and MW-23_20130731 for the analyte Methyl-t-butyl ether were affected by the analyte concentrations already present in the un-spiked sample.
- Primary Compounds not found in typical gasoline: Noted on GRO groundwater results for MW-20, 23 and SB-11.

The MS/MSD qualifier does not affect the data since the spiked samples did not belong to the site sample batch, and the Laboratory Control Sample recoveries are within an acceptable range. Based on a review of the laboratory's analytical reports, including their QA/QC procedures and those implemented by Antea Group, we conclude that the laboratory data obtained during the recent groundwater sampling event are valid and usable for their intended purpose.

2.11 Investigation Derived Waste (IDW)

A total of 17 drums containing IDW were generated during investigation activities. IDW is being temporarily stored on site in 55-gallon Department of Transportation (DOT)-approved steel drums. Antea Group is coordinating appropriate disposal of the waste generated with Belshire Environmental Services. Antea Group will submit any outstanding final waste documentation with the third quarter 2013 semi-annual groundwater monitoring report (or upon receipt). A non-hazardous waste manifest from the May 20, 2013 groundwater sampling event is included as **Appendix J**.

3.0 CONCLUSIONS AND RECOMMENDATIONS

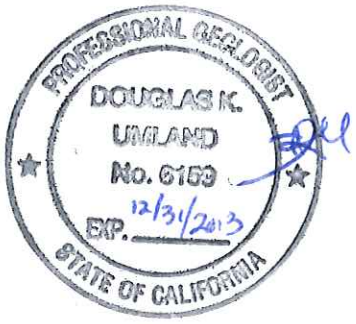
Based on the findings of the current investigation, Antea Group concludes the following:

- The water production capacity of soils above 21 feet is variable at the site and surrounding area, with little to no water production in the locations of MW-24, MW-22 and MW-23.
- The maximum dissolved-phase PCE concentration was reported up-gradient of the site in MW-23, supporting Antea Group's theory that PCE at the site and vicinity is a regional contaminant.
- Since a groundwater sample could not be collected from well MW-22 (adjacent to the waste oil tank) Antea Group cannot determine at this time whether the site's current and former waste oil tanks have contributed to localized PCE concentrations in groundwater.
- Dissolved-phase contaminants are migrating to the east with the direction of groundwater flow, with only minor dispersion to the north and south.
- The dissolved phase contaminant plume consists primarily of GRO, ethylbenzene and xylenes. Benzene was not reported in down-gradient wells MW-20 or MW-21, indicating that the extent of dissolved phase benzene is defined down-gradient between MW-10R and MW-21. GRO concentrations appear to be declining with distance from the site, however the down-gradient extent of GRO and fuel components remain undefined.
- No concentrations of benzene and MTBE in groundwater samples collected during this investigation exceeded the maximum criteria presented in SB-2012 0016.
- No concentrations of benzene, ethylbenzene or naphthalene in soil samples exceeded the direct exposure and outdoor air exposure criteria presented in SB-2012 0016.

Based on these conclusions, Antea Group recommends the following:

- Revisit the site during the third quarter 2013 to attempt to develop wells MW-22 and MW-24 should the wells contain an adequate water column. If the wells contain sufficient water, they will be sampled during a later date after development. If the wells contain insufficient water to develop, we will attempt to collect a grab groundwater sample from MW-22. Data from MW-22 will be used to determine whether the current or former waste oil tank contributed to localized PCE concentrations in groundwater. Data will be presented with the third quarter semi-annual groundwater monitoring and sampling report.
- Install an additional groundwater monitoring well downgradient of well MW-21 on S. El Dorado Avenue, approximately 20 feet south of the intersection with 5th Avenue to define the downgradient extent of the sites dissolved phase hydrocarbon plume.

4.0 REMARKS



The recommendations contained in this document represent Antea USA, Inc.'s professional opinions based upon the currently available information and are arrived at in accordance with currently accepted professional standards. This document is based upon a specific scope of work requested by the client. For any reports cited that were not generated by Delta or Antea Group, the data from those reports is used "as is" and is assumed to be accurate. Antea Group does not guarantee the accuracy of this data for the referenced work performed nor the inferences or conclusions stated in these reports. The contract between Antea USA, Inc. and its client outlines the scope of work, and only those tasks specifically authorized by that contract or outlined in this document were performed. This document is intended only for the use of Antea USA, Inc.'s client and anyone else specifically identified in writing by Antea USA, Inc. as a user of this document. Antea USA, Inc. will not and cannot be liable for unauthorized reliance by any other third party. Other than as contained in this paragraph, Antea USA, Inc. makes no express or implied warranty as to the contents of this document.

2 Analyzed by Standard Method 5520 E&F (Gravimetric)
3 Analyzed by EPA Method 5030/8015M between 8/1992 and 1/1996; by EPA Method 8260 between 12/2006 and the present.
4 Analyzed by EPA Method 8020 between 8/1992 and 1/1996; by EPA Method 8260 between 12/2006 and the present.
5 Analyzed by EPA Method 8260B
6 Analyzed by EPA Method 8010 in 8/1992; 8260B
7 Analyzed by EPA Method 6000/7000
* Sample may not be representative of in-situ conditions because the boring was air knifed to a depth of 5 feet prior to sampling
a Sample was analyzed for Halogenated Volatile Organic Hydrocarbons (HVOCs) by EPA Method 8010. Tetrachloroethene was detected at 6.4 parts per billion and converted to mg/kg. All remaining constituents analyzed by 8010 were non-detect
b Chromatograph pattern: Diesel and non-diesel mixture (<C14; >C22).
c Sample was analyzed for HVOCs by EPA Method 8010. All HVOCs were reported as non-detect.
d The Continuing Calibration Verification (CCV) recovery was not within established control limits.
e The PQL'S and MDL's was raised due to sample dilution.
f Estimated Value (CLP Flags)
g Surrogate recovery outside control limits due to matrix interferences (not confirmed by re-analysis). Noted on toluene-d8 (S) and 4-Bromofluorobenzene (S
h Analyte recovery in the laboratory control sample (LCS) was below QC limits. Result may be biased low
i Result confirmed by second analysis

Gauging Notes:
TOC - Top of Casing
LNAPL - Light non-aqueous phase liquid
NA - Not applicable or not available
NP - LNAPL not present
* - Corrected for LNAPL if present (assumes LNAPL specific gravity = 0.75)
** - Grab groundwater sample

Analytical Notes:
< - Not detected at or above indicated laboratory reporting limit
ug/L - micrograms/liter
BOLD- Detected above indicated laboratory reporting limit
GRO - gasoline range organics (analyzed as TPH as Gasoline)
MTBE - Methyl tertiary-butly ether
DIPE - Di-isopropyl ether
ETBE - Ethyl tertiary-butyl ether
TAME - Tertiary-amyl methyl ether
TBA - Tertiary-butyl alcohol
EDB - 1,2-Dibromoethane
1,2-DCA - 1,2-Dichloroethane
PCE - Tetrachloroethene
TCE - Trichloroethane
cis 1,2-DCE - cis-1,2-Dichloroethene
trans 1,2-DCE - trans-1,2-Dichloroethene
* Naphthalene analysis by Environmental Protection Agency Test Method 8270
All analyses excluding marked naphthalene data were analyzed by EPA Test Method 8260B.

Analytical Qualifiers:
A - The Method Reporting Limit for ethanol has been raised due to the presence of an interfering compound.
B - Primary Compounds not found in typical Gasoline

SUBJECT: UNOCAL 76 STATION #6390 AT 402 SOUTH DELAWARE STREET, SAN MATEO, CALIFORNIA

Dear Mr. Hunter:

Antea Group uploaded the following documents to the State GeoTracker database: 1) assessment report dated July 6, 2012; 2) groundwater and subsurface vapor assessment workplan dated September 7, 2012; and 3) groundwater monitoring report dated November 15, 2012. The following comments are based on San Mateo County Groundwater Protection Program (GPP) staff review of these documents and the project file.

Assessment Report

Section 3.5 of the report and the well construction details indicate #3 sand was used for the filter pack of monitoring wells MW-10R, MW-18, and MW-19. A #3 filter pack certainly does not appear appropriate for MW-10R given the texture of the logged soil. Page 4 of our letter dated November 22, 2011 required filter pack size to be based on the texture of the formation opposite the screened interval. Therefore, we may require replacement of these wells if future problems with siltation or remedial effectiveness should occur.

Section 4.1 of the report states no groundwater is present <21 feet below grade (fbg) within the western portion of the site, which is why only deeper groundwater samples were collected from Borings TW-1 and SB-8. However, the depth to groundwater reported in TW-1 and SB-8 and within site wells suggests groundwater is present at approximately 15 fbg (smearing or compaction of fines from the drilling process may have inhibited groundwater from accumulating in the borehole). Installing a shallow monitoring well near at least Boring SB-8 will resolve this problematic issue (discussed in the workplan portion of this letter) and satisfy the assessment of first groundwater in this area that was required in our November 2011 letter.

Section 5.o of the report does not demonstrate Pace lab qualifiers E and S5 do not affect the use of the data. Please upload to GeoTracker by **March 29, 2013**, a letter from the laboratory demonstrating these qualifiers do not affect the use of the qualified results (concluding they don't without justification is not sufficient).

GPP staff do not consider it reasonable for the isoconcentration lines on Figures 5 and 6 to close west, northeast, and southeast of the fuel UST cavity. Results obtained from the deeper screened monitoring wells should not be used to determine where to close these lines because the investigation demonstrated the greatest fuel hydrocarbon concentrations occur in groundwater <21 fbg and no groundwater sampling data from <21 fbg has been collected west and northeast of the fuel UST cavity and south of MW-10R.

Table 2 does not define the abbreviations used for the halogenated organic compounds listed in the column headings, nor does it define the asterisk footnote. Please ensure this is addressed in future versions of this table. It appears the asterisk footnote denotes samples where the reported volatile organic compound concentrations may not be representative of in-situ conditions because an air-knife was used to clear the borehole prior to sampling.

The site history data in Appendix C is not complete and contains some incorrect data. Please incorporate the following comments into future discussions of site history: 1) two holes were observed in the waste oil UST after its removal; 2) Pacific Environmental Group only identified one well within 0.25 mile of site in June 1996 (a cathodic protection well); and 3) Delta is not awaiting GPP staff approval to implement the October 2010 workplan.

The report concludes the tetrachloroethene (PCE) in deeper groundwater (chiefly >21 fbg) did not originate from site activities because soils beneath the former waste oil tank did not contain PCE and relatively low levels of PCE were reported in groundwater sample SB-8. GPP staff consider this conclusion flawed because PCE was in fact reported in a sample of unsaturated zone soil beneath the waste oil UST (Sample WO1; refer to the laboratory report in the report dated November 24, 1992 – incorrectly reported on Table 2 of assessment report). Furthermore, the grab groundwater sample from SB-8 does not explain why the greatest PCE concentrations in groundwater occur in the deeper screened wells downgradient of Unocal's former waste oil tank cavity (MW-7, MW-12B, MW-13B, and MW-15B). Therefore, at this time, it appears activities at the subject site have contributed to the neighborhood PCE plume in concentrations exceeding water quality objectives.

Workplan

The workplan proposes to install two shallow groundwater monitoring wells and two depth discrete subsurface vapor sampling wells. GPP staff approve the proposed installation of the groundwater monitoring wells with the following conditions:

- Install an additional monitoring well screened from 6 to 21 fbg adjacent to the north side of Boring SB-8 to complete the shallow groundwater assessment near the former waste oil UST (an uncompleted objective of the previous assessment). This well will also provide data to assess the lateral extent of dissolved-phase hydrocarbons west of the fuel UST cavity;

- Consider installing a well screened from 21 to 31 fbg near Boring SB-1 to potentially clarify the contribution of PCE from the subject site (T. Endo Automotive Well MW-2 may not be useful for this purpose because the top of the screened interval is 15 fbg [potential dilution compared to data from wells screened >21 fbg]);

- Base the size of the well filter pack on the texture of the formation opposite the screened interval;

- Attempt to coordinate the sampling of these new wells with the First Quarter 2013 groundwater monitoring event; and

- Upload to the State GeoTracker database by **July 18, 2013**, all electronic files required by California Code of Regulations Title 23, Division 3, Chapter 30, including a report detailing and justifying the methods, findings, conclusions, and recommendations of the investigation.

GPP staff concur subsurface vapor sampling is appropriate, but not from the vapor sampling wells proposed in the workplan. The vapor sampling wells are proposed in landscaped planters adjacent to building foundations and paved areas. Hence, the samples obtained from these wells may underestimate the potential vapor intrusion impact to building occupants because of the physics of subsurface vapor flow near buildings. Therefore, GPP staff approve the subsurface vapor sampling portion of the workplan with the following conditions:

- Install two sub-slab vapor sampling probes in the buildings at 521 and 603 East 5th Avenue instead of the proposed subsurface vapor wells;

- Place the shroud over the sub-slab probe prior to purging (the shroud does not need to surround the Summa canisters if the equipment vacuum test demonstrates the vapor purging and sampling apparatus is tight);

- Record shroud helium concentrations every 30 to 60 seconds (not every 2 to 5 minutes as proposed in the workplan) because the proposed flow rate will fill the proposed 1 liter sampling canister within approximately 6 minutes;

- Collect cold and warm season vapor samples from the sub-slab vapor probes and from existing VP-1 and VP-3 (no Regional Water Quality Control Board soil screening level exists for potential vapor intrusion of PCE);

- Additionally analyze the vapor samples for PCE and naphthalene; and

- Upload to the State GeoTracker database by **May 30, 2014**, all electronic files required by California Code of Regulations Title 23, Division 3, Chapter 30, including a report detailing and justifying the methods, findings, conclusions, and recommendations of the

investigation (assumes offsite access will not be obtained in time to perform cold season vapor sampling before March 2013).

Monitoring Report

The report states the groundwater sample collected from MW-11 may represent groundwater trapped in the well bottom cap from when groundwater elevation exceeded the elevation of the bottom cap. GPP staff consider this conclusion reasonable. Please ensure future versions of Table 3 include a footnote to denote this condition.

The GeoWell files uploaded for the site have not been listing the measured total well depth. Please ensure future GeoWell files list this depth. Please also ensure future hydrocarbon isoconcentration maps are justified as discussed in the assessment report portion of this letter.

The field sampling sheets in Appendix C indicate the depth to the top of the pump intake in the "B" suffixed wells is at the top of the screened interval. This does not appear appropriate, especially when a shallow well is nearby. It appears the depth of the sampling pump intake in the deeper screened wells should approximate 24 fbg. Please also ensure future time series graphs (Appendix F) reference the groundwater elevation to the appropriate datum.

The report recommends discontinuing analysis for PCE. GPP staff do not concur with this conclusion based on the comments in the assessment report portion of this letter. Please continue to additionally analyze the groundwater samples for PCE.

The report recommends discontinuing the calculation of vertical hydraulic gradient. GPP staff do not approve this recommendation. Calculation of vertical hydraulic gradient is customary when shallow/deep well pairs are available (e.g. MW-6/MW-13B and MW-4/MW-19) because contamination does not always remain at the top of the saturated zone. The calculation involves minimal effort because well gauging and construction data are available from other tasks.

Please contact me at (650) 372-6292 or at dmilano@smcgov.org if you have any questions.

Sincerely,

Appendix B

Site Details and Summary of Previous Environmental Investigations

SITE LOCATION AND BACKGROUND

The site is currently an active "76"-branded service station. The station is located approximately one mile west of San Francisco Bay in San Mateo, California, at an elevation of approximately 20 feet above mean sea level. The site facilities include two fuel underground storage tanks (USTs) located in a common pit in the southeast portion of the property, three product dispenser islands, and a station building. The USTs were installed at the site in August 1992 during station upgrade activities. A 550-gallon waste oil UST formerly located behind the station building was removed from the site in 1992.

The site is bounded to the northeast by South Delaware Street and a Jiffy Lube facility (407 South Delaware Street), to the northwest by East Fourth Street and commercial buildings, to the southwest by a parking lot for a Taco Bell restaurant (500 East 4th Avenue), and to the to the southeast by a Legal Aide of San Mateo building (521 South Delaware Street) and parking area.

There are seven existing or former gasoline service stations within ¼-mile of the site area. The site is located in a mixed commercial and residential area. The nearest residences are southwest of the site at 411 South Claremont, or approximately 50 feet southwest of the site and an apartment building is located at 603 East 5th Avenue approximately 75 feet northeast of the site.

SUMMARY OF PREVIOUS ENVIRONMENTAL INVESTIGATIONS

In August 1992, Kaprealian Engineering, Inc. (KEI) observed the removal of two 12,000-gallon, fiberglass gasoline underground storage tanks (USTs), one 550-gallon waste oil UST, and the associated product piping and dispensers. Upon removal of the tanks, a 9-inch crack was observed along the eastern end of the super unleaded gasoline UST, and two 3/16-inch diameter holes were observed in the waste oil tank. A monitoring well had apparently been installed too close to the super unleaded UST, causing the crack. Petroleum hydrocarbon contamination was observed at the eastern end of the gasoline UST cavity. The cavity was over-excavated to remove as much of the impacted soil as possible, resulting in a final excavation that measured approximately 30' by 27' by 22' deep. Initially, six soil samples (A1, A2, B1, B2, SW1, and SW2) were collected from the bottom and sidewalls of the UST cavity, one soil sample (WO1) was collected from the bottom of the waste oil UST cavity, and six soil samples (P1, P2, P3, P4, P5, and P6) were collected from the bottom of the product piping trenches.

At a later date, KEI collected an additional three soil samples (SW1, SW2, and SW3) from the gasoline UST cavity, along with a grab groundwater sample (W1). The water sample was collected after a total of approximately 5,800 gallons of water had been pumped form the gasoline UST cavity. The groundwater had floating product and a heavy sheen. Additionally, KEI collected three soil samples (D1, D2, and D3) from beneath the gasoline dispensers. Laboratory analyses of soil samples collected from the gasoline UST cavity reported relatively high levels of total petroleum hydrocarbons as gasoline (TPHg) benzene, toluene, ethylbenzene, and total xylenes (BTEX compounds), and total petroleum hydrocarbons as diesel (TPHd). The requested petroleum hydrocarbon constituents were not reported above laboratory detection limits in the soil samples collected from the product piping trenches and from beneath the gasoline dispensers. Laboratory analysis of the soil sample from the waste oil UST indicated the

presence of the heavy metals cadmium, chromium, nickel, lead and zinc, while the remaining petroleum hydrocarbon constituents were not indicated at concentrations above the laboratory detection limits. High levels of TPHd, TPHg, and BTEX compounds were also reported in the groundwater sample.

In May 1994, KEI installed three monitoring wells (MW-1, MW-2 and MW-3) at the site. Laboratory analyses of the soil samples collected from the borings for monitoring wells MW-2 and MW-3 indicated the presence of TPHg and BTEX compounds. The requested petroleum hydrocarbon constituents were not reported above laboratory detection limits in the soil samples collected form the MW-1 borehole. The wells were initially gauged and sampled in June 1994. Laboratory analyses of the water samples collected from MW-2 and MW-3 reported the presence of petroleum hydrocarbons in MW-2 and MW-3. The depth to water ranged from 15.33 to 16.71 feet below ground surface (bgs) with a groundwater gradient reported at 0.004 foot/foot to the east. KEI concluded to follow a three-month (quarterly) monitoring program.

In March 1995, two additional monitoring wells (MW-4 and MW-5) were installed at downgradient, off-site locations in the sidewalk along the opposite side of South Delaware Street from the site. Laboratory analyses of the soil samples collected from the monitoring well boreholes indicated the presence of TPHg and BTEX contamination in MW-4. The new wells were added to the quarterly groundwater monitoring program and were first sampled in April 1995. Laboratory analyses of the water samples collected from MW-4 and MW-5 indicated the presence of maximum concentrations of 150,000 micrograms per liter (µg/L) TPHg, 12,000 µg/L benzene, 40,000 µg/L toluene, 4,700 µg/L ethylbenzene, and 31,000 µg/L total xylenes reported in MW-4.

In January 1996, GeoStrategies (GSI) observed the excavation and removal of a 150 gallon capacity oil/water separator. A confirmation soil sample (OWS-S-4.5) was collected from underneath the oil/water separator at a depth of 4.5 feet bgs. Laboratory analysis of the sample indicated the presence of trace concentrations of TPHd, toluene, and total xylenes. Additionally, the presence of the heavy metals chromium, nickel, lead, and zinc were indicated at concentrations of 160 milligrams per kilogram (mg/kg), 99 mg/kg, 13 mg/kg, and 69 mg/kg, respectively. Tetrachloroethylene (PCE) and other chlorinated solvents were not present in the soil sample.

In February 1996, KEI supervised the advancement of three Geoprobe® soil borings (SP1, SP2, and SP4) at off-site locations. The soil borings were terminated at a depth of 13 feet bgs, with groundwater encountered at approximately 10.5 feet bgs. Grab groundwater samples were collected from each borehole. Laboratory analyses of the water samples reported low to moderate levels of TPHg, benzene, ethylbenzene, and total xylenes in the sample from boring SP-4. Petroleum hydrocarbon constituents were not reported above laboratory detection limits in the groundwater samples from borings SP-1 and SP-2.

In June 1996, Pacific Environmental Group, Inc. (Pacific) performed a well survey and reviewed California Department of Water Resources (DWR) well records. One documented well was identified within a ¼-mile radius of the site.

In December 2006 and January 2007, SECOR supervised the following activities: advancement of four direct push soil borings (SP-5 through SP-8), the installation of three soil vapor wells (VP-1 through VP-3) and four additional groundwater monitoring wells (MW-6 through MW-9), and the destruction of four groundwater monitoring wells

(MW-1, MW-2, MW-3, and MW-5). Laboratory analyses of soil samples collected indicated the presence of up to 1,300 mg/kg total purgeable petroleum hydrocarbons (TPPH, MW-6@16.5-17), 0.18 mg/kg benzene (MW-6@11-11.5), 32 mg/kg toluene (MW-6@11-11.5), 20 mg/kg ethylbenzene (MW-6@11-11.5), 110 mg/kg total xylenes (MW-6@11-11.5), and 0.089 mg/kg methyl tertiary butyl ether (MTBE, MW-6@19.5-20). Grab groundwater sample analytical results indicated the presence of up to 51,000 µg/L TPPH (SP-8), 1,300 µg/L benzene (SP-5), 1,500 µg/L toluene (SP-5), 3,000 µg/L ethylbenzene (SP-8), 9,600 µg/L total xylenes (SP-8), and 330 µg/L MTBE (SP-5). Groundwater samples from MW-6 and MW-9 reported petroleum hydrocarbons. Laboratory analyses of the soil vapor samples indicated the presence of up to 0.75 micrograms per liter (µg/L) TPPH (VP-3), up to 16 µg/L toluene (VP-1), 14 µg/L ethylbenzene (VP-3), 42 µg/L m,p-xylenes (VP-3), and 29 µg/L o-xylenes (VP-3).

Based on the results of this investigation, SECOR concluded that hydrocarbons in soil had been adequately delineated, the lateral extent of hydrocarbons in groundwater had been delineated up-gradient and cross-gradient, the lateral extent of hydrocarbons in deeper groundwater had been delineated to the southwest (cross-gradient) by SP-7, and that vapor inhalation did not appear to be an exposure pathway at the site. SECOR recommended installation of a downgradient well in the shallow water bearing zone and downgradient wells in the deeper water bearing zone along East Fifth Avenue and Delaware Street, and to the northwest and northeast (up and cross-gradient) of the site. SECOR recommended groundwater analyses and historical research to identify the possible source of tetrachloroethylene (PCE) in groundwater.

In August 2008, Stantec oversaw the installation of two shallow groundwater monitoring wells (MW-10 and MW-11), and four deeper zone wells (MW-12B, MW-13B, MW-14B, and MW-15B) at locations down-gradient of the subject site. This included the collection of both soil and groundwater samples from the new wells. Stantec also completed a sensitive receptor survey (SRS) as part of this investigation (see below). Stantec concluded that petroleum hydrocarbon plumes in groundwater had been delineated by the new wells, but recommended continued semiannual groundwater monitoring. No additional evaluation of sensitive receptors was recommended based on findings of the SRS (where no sensitive receptors were identified in the immediate down-gradient direction of the site).

Between 2009 and 2010, Delta Consultants prepared an investigation work plan to assess the PCE contamination in groundwater in the vicinity of the site. The San Mateo GPP did not accept the *Potential Source Evaluation and Tetrachloroethene (PCE) Source Evaluation Revised Work Plan on October 29, 2010.* Delta Consultants revised and resubmitted the work plan to the GPP.

In February 2011, Antea Group (formerly Delta Consultants) received conditional approval from the lead oversight agency, San Mateo County GPP, of their October 29, 2010 submittal titled *Potential Source Evaluation and Tetrachloroethene (PCE) Source Evaluation Revised Work Plan.*

Between May and June 2011, Antea Group oversaw the installation of one additional groundwater monitoring well MW-17B, and the advancement of six soil borings SB-1 and SB-3 through SB-7 to assess the potential up-gradient presence of PCE in soil and groundwater, as well as to further quantify the degree and extent of

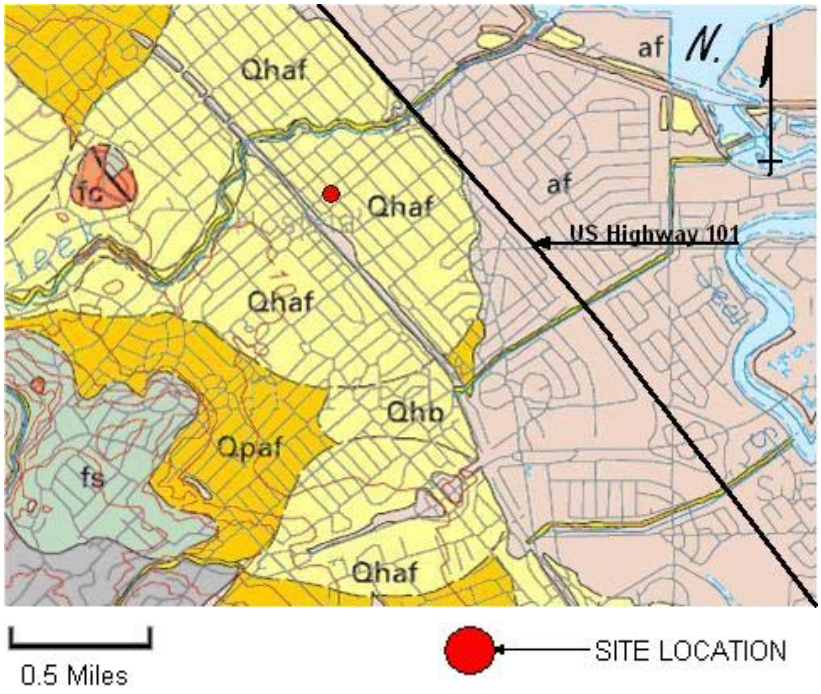
on-site and downgradient hydrocarbon contamination associated with the subject site. Details of the investigation are presented in the July 2011 *Potential Tetrachloroethylene (PCE) Source Investigation Report*.

In April and May 2012, Antea Group completed additional delineation of gasoline contaminants in groundwater to the east and southeast of the USTs, as well as the determining whether or not the subject site is a likely contributor to the PCE contaminant plume present in the regional groundwater. Antea Group oversaw the installation of soil borings SB-8 and SB-9, temporary well TW-1, and monitoring wells MW-18 and MW-19. Also, Antea Group oversaw the destruction of shallow well MW-10, replaced with new well MW-10R at a deeper screened interval. Antea Group submitted the *Additional Site Investigation Report* summarizing the April and May field activities to the GPP on **July 6, 2012**.

On **September 7, 2012**, Antea Group submitted an *Additional Groundwater and Vapor Investigation Work Plan* to the GPP. In this Work Plan, Antea Group is proposing to install two additional monitoring wells downgradient of wells MW-10R and MW-18, as well as two nested vapor wells adjacent to the neighboring, off-site buildings.

Sensitive Receptors

In 1996, a well survey was performed by Pacific. Four wells (three cathodic protection wells and one irrigation well) were identified within ¼-mile of the site. The City of San Mateo confirmed that there are two irrigation wells in Central Park (approximately 2,544 feet south of the site) and one irrigation well at King Center (approximately 3,648 north-northwest of the site).



Stantec performed a sensitive receptor survey within a ½-mile radius of the site during July 2008. Research of the DWR well completion record database identified one irrigation well located approximately 2,208 feet north-northeast of the Site at 1015 2nd Avenue, San Mateo. The well was installed in 1953 to a depth of 46 feet bgs with a screened interval of 30 to 46 feet bgs. There was one surface water body (San Mateo Creek) identified within the limits of the ½-mile survey, approximately 1,488 feet north of the site.

SITE SETTING

Regional Geologic Setting

The site is located on an alluvial plain extending from the Santa Cruz Mountains to the east to the San Francisco Bay. The geologic map of the vicinity below shows that the site is underlain by alluvial fan and fluvial deposits (Qhaf). Near the edge of San Francisco Bay, the deposits consist of medium dense sands that fine upward to sandy or silty clay (E.E. Brabb, et al., 1998). Other deposits in the area are heterogeneous artificial fill (af) and basin

Geologic Map of Vicinity

GEOLOGY OF THE ONSHORE PART OF SAN MATEO COUNTY, CALIFORNIA: DERIVED FROM THE DIGITAL DATABASE OPEN-FILE 98-137

deposits (Qhb) consisting of fine silty clay to clay deposits.

Regional Hydrogeologic Setting

The site is located within the Santa Clara Valley groundwater basin and South Bay hydrologic planning area. Groundwater throughout the area flows typically northeasterly, originating in the Santa Cruz Mountains to the west and flowing towards San Francisco Bay. The basin is composed of alluvial fan deposits formed by tributaries to San Francisco Bay. The water-bearing formations comprise two groups; the Santa Clara Formation of the older Plio-Pleistocene age and the Quaternary age alluvial deposits. The shallow alluvial deposits overlie the Santa Clara Formation and have a maximum depth of about 1,250-feet.

Quaternary age alluvium consists of sand, gravel, silt, and clay deposits that are about 100-feet thick and average about 60-feet thick. The Pliocene age San Mateo Formation consists of deposits of marine sand, gravel, silt, and clay, which are locally water-bearing (DWR 2003).

The prominent groundwater flow direction is to the east.

Pacific Environmental Group, Inc. (Pacific) conducted a well survey and reviewed California Department of Water Resources (DWR) well records in June 1996. PEG only identified one documented cathodic protection well within a ¼-mile radius of the site.

Stantec conducted a sensitive receptor survey within a ½-mile of the site between July 2008 and August 2008 (Stantec 2008). A detailed parcel survey was performed at a 500-foot radius surrounding the site. The parcel survey identified 12 properties with basements, two properties with a sump, and no properties with groundwater wells within the 500-foot radius. A field canvas by Stantec did not identify groundwater production wells, or accompanying facilities associated with groundwater production wells within the search radius. In addition, California Water Service Company, the primary water provider for the area, indicated that they did not have any water supply wells within ½-mile boundary of the survey area.

There is one surface water body identified within the limits of the ½ -mile survey. San Mateo Creek is located approximately 1,488-feet north of the site.

Appendix C

Standard Operating Procedures

STANDARD OPERATING PROCEDURES

Utility Locating

Prior to drilling, boring and excavation locations and an approximate 15-foot by 15-foot box are marked with white paint or other distinct marking and cleared for underground utilities through Underground Service Alert (USA). In addition, Antea Group will contract an independent locator services to clear boring or excavation locations of subsurface assets. The first five feet (or more in instances where utilities are suspected in close proximity) of each borehole are air-knifed, or carefully advanced with a hand auger if shallow soil samples are necessary, to help evaluate the borehole location for underground structures or utilities in accordance with Antea Group's subsurface hazard avoidance policy.

Borehole Advancement using Single-Wall GeoProbe®

Pre-cleaned push rods (typically one to two inches in diameter) are advanced using a hydraulic direct push-type rig for the purpose of collecting samples and evaluating subsurface conditions. The sample barrel located at the leading end of the drill rod serves as a soil sampler, and an acetate liner is inserted into the sample barrel rod prior to advancement of the push rod. Once the sample is collected, the rods and sampler are retracted and the acetate sample tubes are removed from the sampler. The sample barrel is then cleaned, filled with clean acetate liners, inserted into the borehole and advanced to the next sampling point where the sample collection process is repeated.

Undisturbed soil samples selected for laboratory analysis are cut away from the acetate sample liner using a hacksaw, or equivalent tool, in sections approximately 6 inches in length. The 6 inch samples are lined at each end with Teflon® sheets and capped with plastic caps. Labels documenting project number, borehole identification, collection date, and depth are affixed to each sample. The samples are then placed into an ice-filled cooler for delivery under chain-of-custody to a laboratory certified by the State of California for analysis. The remaining collected soil that has not been selected for laboratory analysis is logged using the United Soil Classification System (USCS) under the direction of a State Registered Professional Geologist, and is field screened for organic vapors using a photo ionization detector (PID), or an equivalent tool.

Borehole Advancement using Hollow Stem Auger

Pre-cleaned hollow stem augers (typically 8 to 10 inches in diameter) are advanced using a drill rig for the purpose of collecting samples and evaluating subsurface conditions. Often, the borehole location if first sampled using Single-Wall Geoprobe procedures described above. If Geoporbe is not use, then a pre-cleaned split spoon sampler is lined with three 6-inch long brass or stainless steel tubes and attached to the drill rods. The sampler is then driven 18 inches into the underlying soils at the target sample interval by repeatedly dropping a 140-pound hammer over a 30-inch free fall distance. The number of blow counts to drive the sampler each 6-inch interval of sampler advancement are recorded on the field logs. The sampler is driven 18 inches or until the sampler has met refusal (typically 50 blows per six inches), then the sampler is retrieved. Alternatively, soil samples are retrieved by driving the sampler using a pneumatic hammer, when using a limited access rig.

Generally the bottom sample tube is selected for laboratory analysis. The middle tube is extruded for logging and PID screening, and the top tube is considered slough caved off from the sides of the boring prior to sampling. The retained

sample is carefully packaged for chemical analysis by capping each end of the sample with a Teflon sheet followed by a tight-fitting plastic cap and stored in a zip-type plastic bag. A label is affixed to the sample indicating the sample identification number, borehole number, sampling depth, sample collection date, and job number. The sample is then annotated on a chain-of-custody form and placed in an ice-filled cooler for transport to the laboratory.

During the drilling process, a physical description of the encountered soil characteristics (i.e. moisture content, consistency or density, odor, color, and plasticity), drilling difficulty, and soil type as a function of depth are described on boring logs. The soil cuttings are classified in accordance with the USCS.

Hand Auger Borings

Hand auger borings are advanced to shallow depth – typically not exceeding 15 feet bgs. The hand auger boring is typically between 2 and 4 inches in diameter. Soil samples are collected either directly from the hand auger bucket, or using a slide hammer if subsurface conditions allow. Soil samples are contained in one to two-inch diameter, 6-inch long brass soil rings, lined on each end with Teflon sheeting and sealed with plastic end caps. Once the hand auger boring is advanced to the total depth, the boring is abandoned by using a tremmie pipe to grout the borehole from the bottom up. The boring location is capped with concrete.

Grab Groundwater Sample Collection

Once the target groundwater sampling depth has been reached, a one inch diameter schedule 80 polyvinyl chloride (PVC) temporary well casing equipped with five feet of 0.02-inch machine slotted screen and a pre-attached san pack is lowered into the borehole. Grab groundwater samples are collected by lowering a pre-cleaned, single-sample polypropylene, disposable bailer or pre-cleaned stainless steel bailer down the inside of the temporary well casing. The groundwater sample is decanted from the bailer to the sample container through a bottom emptying flow control valve to minimize volatilization.

Collected water samples are decanted directly into laboratory provided, pre-cleaned, vials or containers and sealed with Teflon-lined septum, screw-on lids. Labels documenting sample number, well identification, collection date, and type of preservative (if applicable, i.e. HCl for volatile organic compound analysis) are affixed to each sample. The samples are then placed into an ice-filled cooler for delivery under chain-of-custody to a laboratory certified by the State of California to perform the specified tests.

Borehole Completion

Upon completion of drilling and sampling, the inner casing rods are retracted. Neat cement grout, mixed at a ratio of 6 gallons of water per 94 pounds of Portland cement, is introduced via a tremie pipe to displace standing water in the borehole, through the annulus of the outer casing rods. The outer rods are retracted as the grout is introduced to bottom of the boring to prevent the cross contamination of encountered water bearing zones. Displaced groundwater is collected at the surface and placed into DOT approved 55-gallon steel drums, or an equivalent storage container. In areas where the borehole penetrates asphalt or concrete, the borehole is capped with an equivalent thickness of asphalt or concrete patch to match finished grade.

Well Construction (typical)

Selected borings will be converted to groundwater monitoring wells by the installation of 2-inch diameter schedule 40 pvc well casing with 0.020-inch factory slotted well screen as stated in the body of the work plan. A filter pack of Monterey #2/16 grade sand (or equivalent) will be placed in the annular space of the monitoring well borings, extending from the bottom of each well casing to one or two-feet above the top of the screened casing. After emplacement of the sand pack, the submerged screen length is surged using a surge block in order to settle the sand pack. After settlement of the sand pack, a sanitary seal consisting of a 2-foot bentonite is placed on above the filter sand and charged with water to create a seal. Neat cement grout, mixed at a ratio of 6 gallons of water per 94 pounds of Portland cement, is introduced via a tremie pipe to displace standing water in the well annulus bentonite to within two feet of the ground surface. A traffic-rated well box will be installed on each well to protect and finish the well to surface grade.

The groundwater monitoring wells will be allowed to stabilize for a minimum of 72 hours after installation prior to development. Following development, the wells will be allowed stabilize for a minimum of 48 hours prior to the collection of any groundwater samples.

Organic Vapor Reading Collection

Soil samples are collected for analysis in the field for ionizable organic compounds using a PID with a 10.2 eV lamp. The test procedure involves measuring approximately 30 grams from an undisturbed soil sample, placing this sub-sample in a Zip-type bag or foil-wrapped jar. The container is warmed for approximately 20 minutes in the sun; then the head-space within the container is tested for total organic vapor, measured in parts per million as benzene (ppm; volume/volume). The instrument is calibrated prior to drilling. The results of the field-testing are noted on the boring logs. PID readings are useful as a qualitative indication of relative levels of contamination, but cannot be used to quantify petroleum hydrocarbon concentrations with the confidence of laboratory analyses.

Equipment Decontamination

Equipment that could potentially come in contact subsurface media and compromise the integrity of the samples is carefully decontaminated prior to drilling and sampling. Drilling auger and other large pieces of equipment are decontaminated using high pressure hot water spray. Soil and groundwater sampling apparatus, groundwater pumps, liners and other equipment are decontaminated in an Alconox scrub solution and double rinsed in clean tap water rinse followed by a final distilled water rinse.

The rinsate and other wastewater are contained in 55-gallon DOT-approved drums, labeled (to identify the contents, generation date and project) and stored on-site pending waste profiling and disposal.

Waste Handling and Disposal *(Soil Cuttings and Rinsate/Purge Water)*

Soil cuttings and rinsate/purge water generated during drilling and sampling are stored on-site in DOT-approved 55-gallon steel drums pending characterization. A label is affixed to the drums indicating the contents of the drum, suspected contaminants, date of generation, and the boring number from which the waste is generated. The drums are removed from the site by a licensed waste disposal contractor to an appropriate facility for treatment/recycling.

 2013 SUBSURFACE DRILLING PERMIT APPLICATION

REQUIREMENTS:

An accurate & correct map of existing and proposed well/boring locations **must** be included with the permit application. The well/boring location map **must** include the following.

1. North arrow, existing & historic site features, wells, approximate property lines and any other pertinent existing & historic features and information.
2. Proposed well/boring locations to scale.

A work plan describing the drilling and construction/destruction methodology may be requested by County staff. Upon review of information on this application, and subject to approval noted below, a permit will be issued allowing well/boring owner, driller, and responsible professional to perform the specified work. The permit is subject to both General and Special Conditions stated below. A copy of the approved Subsurface Drilling Permit **must** be available on site while work related to the permit is being performed. Drilling may begin at the notified date and time whether County staff is present or not.

GENERAL CONDITIONS:

A. Well and boring construction and destruction under this permit is subject to the Standards for the Construction of Wells in San Mateo County, County Groundwater Protection Program (GPP) Guidelines, Policies & Procedures, the State Water Well Standards, and any instructions by a Health Department representative.

B. Well/Boring Owner, Driller, and Responsible Professional assume responsibility for all activities and uses under the permit, including compliance with Workmen's Compensation Laws, and indemnify, defend and save the County of San Mateo, its' officers, agents and employees, free and harmless from any and all expense, cost, or liability in connection with or resulting from work or stopped-work associated with the permit, including, but not limited to, property damage, personal injury, wrongful death, and loss of income.

C. All borings **must** be properly destroyed (grouted/sealed) within 24 hours of drilling unless special conditions are approved in writing as part of this permit. Borings lasting longer than 24 hours without a variance are considered wells.

D. Analytical results of all soil, vapor, and groundwater samples collected during the execution of drilling under this permit **must** be submitted to County GPP staff by the Responsible Professional within 60 days of sample collection. If contamination is discovered during drilling, verbal notification to County GPP by the Responsible Professional is **required** within 72 hours of discovery. Proper storage, labeling & disposal of investigation-derived residual wastes are the responsibility of the consultant unless stated otherwise contractually.

E. A copy of the State DWR Form 188, boring logs and well construction details for all borings/wells except geotechnical borings, signed by a Responsible Professional, **must** be submitted to County GPP by the Responsible Professional within 60 days of drilling/construction/destruction. As-built locations/dimensions **must** be finalized in subsequent report of findings submitted to County GPP by the Responsible Professional within 60 days of drilling/construction/destruction.

F. Permit is valid only for the purpose specified herein. No change in purpose or required procedures, as described on this permit application, in the associated workplan, or in the special conditions below, will be allowed except upon written permission from the County. Construction aspects can be changed based on conditions encountered in the field.

G. Permit is valid for a mobilization associated with originally permitted boring/well locations only, including contingency locations, and is automatically canceled if not exercised, or if an extension is not applied for and granted within 120 days of the original permit issuance date. Failure to notify staff of cancellation or delay in start time will result in the Consultant being billed an Inspection Cancellation fee of $264 for 2013 if GPP staff attempted to perform an inspection.

H. Wells installed under this permit may not be used for domestic, municipal, commercial, or irrigation water supply.

I. All work performed **must** conform to Business and Profession Codes and State Water Well Standards.

J. Top-of-casing elevation of all wells **must** be surveyed to the nearest 0.01-foot relative to Mean Sea Level or NAVD88 and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate. Geotechnical wells are exempt from this requirement if a written variance from GPP is obtained prior to drilling.

K. Latitude and longitude of all wells **must** be surveyed with sub-meter accuracy relative to NAD83 and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate.

L. Violation of any requirement or general or special permit condition may result in an order by GPP staff to cease work under this permit, correct the violation, and potentially re-permit the work as a new mobilization.

SPECIAL CONDITIONS: (1) IMMEDIATELY DRILL OUT MW-11 IF WELL DOES NOT HOLD REQUIRED PRESSURE

Subject: **Letter of Intent – Permit rider #10 for permit #4819 for installation of two monitoring wells at the intersection of South Delaware Street and East Fifth Avenue, one at western corner of intersection and one approximately 85 feet northbound on East Fifth Avenue**

Dear Ms. Judy Dulik:

Antea™Group (Antea Group) has prepared this letter of intent regarding the proposed construction of monitoring wells MW-20 and MW-21 at the intersection of South Delaware Street and East Fifth Avenue. MW-21 is proposed approximately 85 feet north-east of the intersection at East Fifth Avenue and Delaware Street. MW-20 was originally located at the western corner of the intersection, but due to the large amount of utilities in the proposed location, the well has been moved to the southeastern corner of the intersection. All proposed work is related to 76 Service Station No. 6390, located at 402 South Delaware Avenue in San Mateo, California (see attached site plan). Antea Group will be requesting permit rider #10 for permit #4818 for the proposed scope of work.

The proposed scope of work is based on the *Additional Groundwater and Vapor Investigation Work Plan* dated September 7, 2012.

Sincerely,

Okay for issue E.P. - Rider

Subject: Letter of Intent – Additional work for permit rider #9 for E.P. #4819 for regulator-requested installation of one monitoring well on East 5th Avenue approximately 35 feet west of South Delaware Street and the destruction of monitoring well MW-11 on South Delaware Street approximately 40 feet south of East 5th Avenue

Dear Ms. Judy Dulik:

Antea Group has prepared this letter of intent regarding the installation of one monitoring well on East 5th Avenue approximately 35 feet west of South Delaware Street and the destruction of monitoring well MW-11 on South Delaware Street approximately 40 feet south of East 5th Avenue. Please see the attached site plan and traffic control plans for exact locations. This scope of work is in addition to two letters of intent approved by the Gary Heap on 1/25/13 and 1/28/13 (for the installation of two monitoring wells and one vapor point at the intersection respectively). This additional work was requested by the San Mateo County GPP regulator for this site in correspondence exchanged after we received the 1/25/13 and 1/28/13-approved letters of intent for permit rider #9 (see attached correspondence).

Can we please get this LOI approved so we can add the work to permit rider #9 for E.P. #4819? We would appreciate a response as soon as possible because it has been requested that we complete this additional work during our scheduled mobilization on March 13-15, 2013 for the original scope of work.

All proposed work is related to the 76 Service Station No. 6390, 402 South Delaware Street, San Mateo.

Sincerely,

David Sisak

FA 50947

 2012 SUBSURFACE DRILLING PERMIT APPLICATION

REQUIREMENTS:

An accurate & correct map of existing and proposed well/boring locations **must** be included with the permit application. The well/boring location map **must** include the following.

1. North arrow, existing & historic site features, wells, approximate property lines and any other pertinent existing & historic features and information.
2. Proposed well/boring locations to scale.

A work plan describing the drilling and construction/destruction methodology, at a minimum, **is required** by County Staff. Upon review of information on this application and the submitted work plan, and subject to approval noted below, a permit will be issued allowing well/boring owner, driller, and responsible professional (consultant) to perform the specified work. The permit is subject to both General and Special Conditions stated below. A copy of the approved Subsurface Drilling Permit **must** be available on site while work related to the permit is being performed. Drilling may begin at the notified date and time whether County staff is present or not.

GENERAL CONDITIONS:

A. Well and boring construction and destruction under this permit is subject to the Standards for the Construction of Wells in San Mateo County, County Groundwater Protection Program (GPP) Guidelines, Policies & Procedures, the State Water Well Standards, and any instructions by a Health Department representative.

B. Well/Boring Owner, Driller, and Responsible Professional assume responsibility for all activities and uses under the permit, including compliance with Workmen's Compensation Laws, and indemnify, defend and save the County of San Mateo, its' officers, agents and employees, free and harmless from any and all expense, cost, or liability in connection with or resulting from work or stopped-work associated with the permit, including, but not limited to, property damage, personal injury, wrongful death, and loss of income.

C. All borings **must** be properly destroyed (grouted/sealed) within 24 hours of drilling unless special conditions are approved in writing as part of this permit. Borings lasting longer than 24 hours without a variance are considered wells.

D. Analytical results of all soil and groundwater samples collected during the execution of drilling under this permit **must** be submitted to County GPP staff by the Responsible Professional within 60 days of sample collection. If contamination is discovered during drilling, verbal notification to County GPP by the Responsible Professional is **required** within 72 hours of discovery. Proper storage, labeling & disposal of investigation-derived residual wastes are the responsibility of the consultant unless stated otherwise contractually.

E. A copy of the State DWR Form 188, boring logs and well construction details for all borings/wells except geotechnical borings, signed by a Responsible Professional, **must** be submitted to County GPP by the Responsible Professional within 60 days of drilling/construction/destruction. As-built locations/dimensions **must** be finalized in subsequent report of findings submitted to County GPP by the Responsible Professional within 60 days of drilling/construction/destruction.

F. Permit is valid only for the purpose specified herein. No change in purpose or required procedures, as described on this permit application, in the associated workplan, or in the special conditions below, will be allowed except upon written permission from the County. Construction aspects can be changed based on conditions encountered in the field.

G. Permit is valid for mobilizations associated with originally permitted boring/monitoring well locations only, including contingency locations, and is automatically canceled if not exercised, or if an extension is not applied for and granted by County GPP, within 120 days of the original permit issuance date. Failure to notify staff of cancellation or delay in start time, at least one minute prior to the notified start time, will result in the Consultant being billed an Inspection Cancellation fee of $264 for 2012 if GPP staff attempted to perform an inspection.

H. Wells installed under this permit may not be used for domestic, municipal, commercial, or irrigation water supply.

I. All work plans and reports related to work performed under County oversight **must** conform to Business and Profession Codes and State Water Well Standards.

J. Top-of-casing elevation of all wells **must** be surveyed to the nearest 0.01-foot relative to Mean Sea Level or NAVD88 and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate. Geotechnical wells are exempt from this requirement if a written variance from GPP is obtained prior to drilling.

K. Latitude and longitude of all wells **must** be surveyed with sub-meter accuracy relative to NAD83 and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate.

L. Violation of any requirement or general or special permit condition may result in an order by GPP staff to cease work under this permit, correct the violation, and potentially re-permit the work as a new mobilization.

Subject: ***Subsurface Drilling Permit Applications*** **for onsite and offsite subsurface drilling related to 76 Service Station No. 6390, 402 S Delaware Street, San Mateo, as requested in letter correspondence from the GPP dated 2/21/13.**

Dear Mr. Milano:

Antea Group is submitting the attached *Subsurface Drilling Permit Applications* for the installation of monitoring well MW-24 at the intersection of South Delaware Street and East 5th Avenue, the installation of monitoring well MW-22 and advancement of soil boring SB-11 at the 76 Service Station No. 6390, 402 S Delaware Street, San Mateo, and the installation of monitoring well MW-23 at 500 East 4th Avenue, San Mateo.

All proposed work is related to the 76 Service Station No. 6390, 402 South Delaware Street, San Mateo.

Please contact me if you have any questions or concerns.

Sincerely,

David Sisak
Staff Professional

FA 53042

 2013 SUBSURFACE DRILLING PERMIT APPLICATION

REQUIREMENTS:

An accurate & correct map of existing and proposed well/boring locations **must** be included with the permit application. The well/boring location map **must** include the following.

1. North arrow, existing & historic site features, wells, approximate property lines and any other pertinent existing & historic features and information.
2. Proposed well/boring locations to scale.

A work plan describing the drilling and construction/destruction methodology may be requested by County staff. Upon review of information on this application, and subject to approval noted below, a permit will be issued allowing well/boring owner, driller, and responsible professional to perform the specified work. The permit is subject to both General and Special Conditions stated below. A copy of the approved Subsurface Drilling Permit **must** be available on site while work related to the permit is being performed. Drilling may begin at the notified date and time whether County staff is present or not.

GENERAL CONDITIONS:

A. Well and boring construction and destruction under this permit is subject to the Standards for the Construction of Wells in San Mateo County, County Groundwater Protection Program (GPP) Guidelines, Policies & Procedures, the State Water Well Standards, and any instructions by a Health Department representative.

B. Well/Boring Owner, Driller, and Responsible Professional assume responsibility for all activities and uses under the permit, including compliance with Workmen's Compensation Laws, and indemnify, defend and save the County of San Mateo, its' officers, agents and employees, free and harmless from any and all expense, cost, or liability in connection with or resulting from work or stopped-work associated with the permit, including, but not limited to, property damage, personal injury, wrongful death, and loss of income.

C. All borings **must** be properly destroyed (grouted/sealed) within 24 hours of drilling unless special conditions are approved in writing as part of this permit. Borings lasting longer than 24 hours without a variance are considered wells.

D. Analytical results of all soil, vapor, and groundwater samples collected during the execution of drilling under this permit **must** be submitted to County GPP staff by the Responsible Professional within 60 days of sample collection. If contamination is discovered during drilling, verbal notification to County GPP by the Responsible Professional is **required** within 72 hours of discovery. Proper storage, labeling & disposal of investigation-derived residual wastes are the responsibility of the consultant unless stated otherwise contractually.

E. A copy of the State DWR Form 188, boring logs and well construction details for all borings/wells except geotechnical borings, signed by a Responsible Professional, **must** be submitted to County GPP by the Responsible Professional within 60 days of drilling/construction/destruction. As-built locations/dimensions **must** be finalized in subsequent report of findings submitted to County GPP by the Responsible Professional within 60 days of drilling/construction/destruction.

F. Permit is valid only for the purpose specified herein. No change in purpose or required procedures, as described on this permit application, in the associated workplan, or in the special conditions below, will be allowed except upon written permission from the County. Construction aspects can be changed based on conditions encountered in the field.

G. Permit is valid for a mobilization associated with originally permitted boring/well locations only, including contingency locations, and is automatically canceled if not exercised, or if an extension is not applied for and granted within 120 days of the original permit issuance date. Failure to notify staff of cancellation or delay in start time will result in the Consultant being billed an Inspection Cancellation fee of $264 for 2013 if GPP staff attempted to perform an inspection.

H. Wells installed under this permit may not be used for domestic, municipal, commercial, or irrigation water supply.

I. All work performed **must** conform to Business and Profession Codes and State Water Well Standards.

J. Top-of-casing elevation of all wells **must** be surveyed to the nearest 0.01-foot relative to Mean Sea Level or NAVD88 and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate. Geotechnical wells are exempt from this requirement if a written variance from GPP is obtained prior to drilling.

K. Latitude and longitude of all wells **must** be surveyed with sub-meter accuracy relative to NAD83 and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate.

L. Violation of any requirement or general or special permit condition may result in an order by GPP staff to cease work under this permit, correct the violation, and potentially re-permit the work as a new mobilization.

FA 51532

 2012 SUBSURFACE DRILLING PERMIT APPLICATION

REQUIREMENTS:

An accurate & correct map of existing and proposed well/boring locations **must** be included with the permit application. The well/boring location map **must** include the following.

1. North arrow, existing & historic site features, wells, approximate property lines and any other pertinent existing & historic features and information.
2. Proposed well/boring locations to scale.

A work plan describing the drilling and construction/destruction methodology, at a minimum, **is required** by County Staff. Upon review of information on this application and the submitted work plan, and subject to approval noted below, a permit will be issued allowing well/boring owner, driller, and responsible professional (consultant) to perform the specified work. The permit is subject to both General and Special Conditions stated below. A copy of the approved Subsurface Drilling Permit **must** be available on site while work related to the permit is being performed. Drilling may begin at the notified date and time whether County staff is present or not.

GENERAL CONDITIONS:

A. Well and boring construction and destruction under this permit is subject to the Standards for the Construction of Wells in San Mateo County, County Groundwater Protection Program (GPP) Guidelines, Policies & Procedures, the State Water Well Standards, and any instructions by a Health Department representative.

B. Well/Boring Owner, Driller, and Responsible Professional assume responsibility for all activities and uses under the permit, including compliance with Workmen's Compensation Laws, and indemnify, defend and save the County of San Mateo, its' officers, agents and employees, free and harmless from any and all expense, cost, or liability in connection with or resulting from work or stopped-work associated with the permit, including, but not limited to, property damage, personal injury, wrongful death, and loss of income.

C. All borings **must** be properly destroyed (grouted/sealed) within 24 hours of drilling unless special conditions are approved in writing as part of this permit. Borings lasting longer than 24 hours without a variance are considered wells.

D. Analytical results of all soil and groundwater samples collected during the execution of drilling under this permit **must** be submitted to County GPP staff by the Responsible Professional within 60 days of sample collection. If contamination is discovered during drilling, verbal notification to County GPP by the Responsible Professional is **required** within 72 hours of discovery. Proper storage, labeling & disposal of investigation-derived residual wastes are the responsibility of the consultant unless stated otherwise contractually.

E. A copy of the State DWR Form 188, boring logs and well construction details for all borings/wells except geotechnical borings, signed by a Responsible Professional, **must** be submitted to County GPP by the Responsible Professional within 60 days of drilling/construction/destruction. As-built locations/dimensions **must** be finalized in subsequent report of findings submitted to County GPP by the Responsible Professional within 60 days of drilling/construction/destruction.

F. Permit is valid only for the purpose specified herein. No change in purpose or required procedures, as described on this permit application, in the associated workplan, or in the special conditions below, will be allowed except upon written permission from the County. Construction aspects can be changed based on conditions encountered in the field.

G. Permit is valid for mobilizations associated with originally permitted boring/monitoring well locations only, including contingency locations, and is automatically canceled if not exercised, or if an extension is not applied for and granted by County GPP, within 120 days of the original permit issuance date. Failure to notify staff of cancellation or delay in start time, at least one minute prior to the notified start time, will result in the Consultant being billed an Inspection Cancellation fee of $264 for 2012 if GPP staff attempted to perform an inspection.

H. Wells installed under this permit may not be used for domestic, municipal, commercial, or irrigation water supply.

I. All work plans and reports related to work performed under County oversight **must** conform to Business and Profession Codes and State Water Well Standards.

J. Top-of-casing elevation of all wells **must** be surveyed to the nearest 0.01-foot relative to Mean Sea Level or NAVD88 and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate. Geotechnical wells are exempt from this requirement if a written variance from GPP is obtained prior to drilling.

K. Latitude and longitude of all wells **must** be surveyed with sub-meter accuracy relative to NAD83 and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate.

L. Violation of any requirement or general or special permit condition may result in an order by GPP staff to cease work under this permit, correct the violation, and potentially re-permit the work as a new mobilization.

Blaine Tech Services Standard Operating Procedures

BLAINE TECH SERVICES, INC.
METHODS AND PROCEDURES
FOR THE ROUTINE MONITORING OF
GROUNDWATER WELLS

SAMPLING PROCEDURES OVERVIEW

SAFETY

All groundwater monitoring assignments performed for DELTA comply with safety guidelines, 29 CFR 1910.120 and SB-198 Injury and Illness Prevention Program (IIPP). All Field Technicians receive the full 40 hour 29CFR 1910.120 OSHA SARA HAZWOPER course, medical clearance and on-the-job training prior to commencing any work on any DELTA COP/ELT site.

INSPECTION AND GAUGING

Wells are inspected prior to evacuation and sampling. The condition of the wellhead is checked and noted according to a wellhead inspection checklist.

Standard measurements include the depth to water (DTW) and the total well depth (TD) obtained with industry standard electronic sounders which are graduated in increments of hundredths of a foot.

The water in each well is inspected for the presence of Immiscibles or sheen and when free product is suspected, it is confirmed using an electronic interface probe (e.g. MMC). No samples are collected from a well containing free product.

EVACUATION

Depth to water measurements are collected by our personnel prior to purging and minimum purge volumes are calculated anew for each well based on the height of the water column and the diameter of the well. Expected purge volumes are never less than three case volumes and are set at no less than four case volumes in some jurisdictions.
Well purging devices are selected on the basis of the well diameter and the total volume to be evacuated. In most cases the well will be purged using an electric submersible pump (i.e. Grundfos) suspended near (but not touching) the bottom of the well. Small volumes of purgewater are often removed by hand bailing with a disposable bailer.

PARAMETER STABILIZATION

Well purging completion standards include minimum purge volumes, but additionally require stabilization of specific groundwater parameters prior to sample collection. Typical groundwater parameters used to measure stability are electrical conductivity, pH, and temperature. Instrument readings are obtained at regular intervals during the evacuation process (no less

than once per case volume).

Stabilization standards for routine quarterly monitoring of fuel sites include the following: Temperature is considered to have stabilized when successive readings do not fluctuate more than +/- 1 degree Celsius. Electrical conductivity is considered stable when successive readings are within 10%. pH is considered to be stable when successive readings remain constant or vary no more than 0.2 of a pH unit.

DEWATERED WELLS

Normal evacuation removes no less than three case volumes of water from the well. However, less water may be removed in cases where the well dewaters and does not recharge.

Wells known to dewater are evacuated as early as possible during each site visit in order to allow for the greatest amount of recovering. Any well that does not recharge to 80% of its original volume will be sampled prior to the departure of our personnel from the site in order to eliminate the need of a return visit.

In jurisdictions where a certain percentage of recovery is included in the local completion standard, our personnel follow the regulatory expectation.

PURGEWATER CONTAINMENT

All non-hazardous purgewater evacuated from each groundwater monitoring well is captured and contained in on-board storage tanks on the Sampling Vehicle and/or special water hauling trailers. Effluent from the decontamination of reusable apparatus (sounders, electric pumps and hoses etc.), consisting of groundwater combined with deionized water and non-phosphate soap, is also captured and pumped into effluent tanks.

Non hazardous purgewater is transported under standard Bill of Lading or Non-Hazardous manifest to a Blaine Tech Services, Inc. facility before being transported to an approved disposal facility.

SAMPLE COLLECTION DEVICES

All samples are collected using disposable bailers.

SAMPLE CONTAINERS

Sample material is decanted directly from the sampling bailer into sample containers provided by the laboratory which will analyze the samples. The type of sample container, material of construction, method of closure and filling requirements are specific to the intended analysis. Chemicals needed to preserve the sample material are commonly placed inside the sample containers by the laboratory or glassware vendor prior to delivery of the bottle to our personnel. The laboratory sets the number of replicate containers.

TRIP BLANKS

Upon request, a Trip Blank is carried to each site and is kept inside the cooler for the duration of the sampling event. It is turned over to the laboratory for analysis with the samples from that site.

DUPLICATES

Upon request, one Duplicate sample is collected at each site. It is up to the Field Technician to choose the well at which the Duplicate is collected. Typically, a duplicate is collected from one of the most contaminated wells. The Duplicate sample is labeled DUP thus rendering the sample blind.

SAMPLE STORAGE

All sample containers are promptly placed in food grade ice chests for storage in the field and transport (direct or via our facility) to the analytical laboratory that will perform the intended analytical procedures. These ice chests contain quantities of restaurant grade ice as a refrigerant material. The samples are maintained in either an ice chest or a refrigerator until relinquished into the custody of the laboratory or laboratory courier.

DOCUMENTATION CONVENTIONS

Each and every sample container has a label affixed to it. In most cases these labels are generated by our office personnel and are partially preprinted. Labels can also be hand written by our field personnel. The site is identified with the store number and site address, as is the particular groundwater well from which the sample is drawn (e.g. MW-1, MW-2, S-1 etc.). The time at which the sample was collected and the initials of the person collecting the sample are handwritten onto the label.

Chain of Custody records are created using client specific preprinted forms following USEPA specifications.

Bill of Lading records are contemporaneous records created in the field at the site where the non-hazardous purgewater is generated. Field Technicians use preprinted Bill of Lading forms.

DECONTAMINATION

All equipment is brought to the site in clean and serviceable condition and is cleaned after use in each well and before subsequent use in any other well. Equipment is decontaminated before leaving the site.

The primary decontamination device is a commercial steam cleaner. The steam cleaner is de-tuned to function as a hot pressure washer which is then operated with high quality deionized water which is produced at our facility and stored onboard our sampling vehicle. Cleaning is facilitated by the use of proprietary fixtures and devices included in the patented workstation that is incorporated in each sampling vehicle. The steam cleaner is used to decon reels, pumps

and bailers.

Any sensitive equipment or parts (i.e. Dissolved Oxygen sensor membrane, sounder etc.) that cannot be washed using the hot high pressure water, will be sprayed with a non-phosphate soap and deionized water solution and rinsed with deionized water.

EXAMPLE: The sounder is cleaned between wells using the non-phosphate soap and deionized water solution followed by deionized water rinses. The sounder is then washed with the steam cleaner between sites or as necessitated by use in a particularly contaminated well.

DISSOLVED OXYGEN READINGS

All Dissolved Oxygen readings are taken using YSI meters (e.g. YSI Model 550 meter). These meters are equipped with membrane probe that enables them to collect accurate in-situ readings.

The probe and reel is decontaminated between wells as described above. The meter is calibrated as per the instructions in the operating manual. The probe is lowered into the water column allowed to stabilize before use.

OXYIDATON REDUCTION POTENTIAL READINGS

All readings are obtained with either Corning or Myron-L meters (e.g. Corning ORP-65 or a Myron-L Ultrameter GP). The meter is cleaned between wells as described above. The meter is calibrated at the start of each day according to the instruction manual. In use the probe is placed in a cup of freshly obtained monitoring well water and allowed to stabilize.

Blaine Tech Services, Inc.
Standard Operating Procedure

LOW-FLOW SAMPLING

Rediflo2

1. Calibrate YSI Flow Cell as per manufacturer's specifications. Thoroughly rinse probe and cup between parameters. Calibration order as follows:

    A. pH (use 3-point calibration of 7, 4, 10)
    B. Oxygen Reduction Potential (ORP)
    C. Specific Conductance
    D. Dissolved Oxygen (DO) (calibrate simulating 100% oxygen saturation)

2. Thoroughly decontaminate pump and reel.
3. Remove dedicated PE tubing from the well or start with new PE tubing cut to the required length.
4. Attach the PE tubing to the Rediflo2 Pump.
5. Gently lower the Rediflo2 pump and PE tubing into the well, placing the Rediflo2 Pump intake at the center of the wetted screened interval. Take care to minimize disturbance to the water column.
6. Direct effluent line into YSI 556 Flow Cell.
7. Set Rediflo2 Pump speed at 100 - 500 ml/min.
8. Collect water quality parameter measurements for temperature, pH, conductivity, turbidity, DO and ORP every 3-5 minutes.
9. Monitor drawdown during purging with electronic water level meter. Record water level with each parameter measurement. MAXIMUM DRAWDOWN IS 0.33 FEET.
10. Collect parameter measurements until stability is achieved. Stability is defined as three consecutive measurements where:

Temp	± 1° Celsius
pH	± 0.1
Conductivity	± 3%
Turbidity	± 10% NTU
DO	± 0.3 mg/l
ORP	± 10 Mv

11. Disconnect effluent line from YSI 556 Flow Cell.
12. Sample through effluent line while maintaining constant flow rate.
13. Remove Rediflo2 Pump and PE tubing from well.
14. Detach and reinstall dedicated PE tubing in well.

Blaine Tech Services, Inc.
Standard Operating Procedure

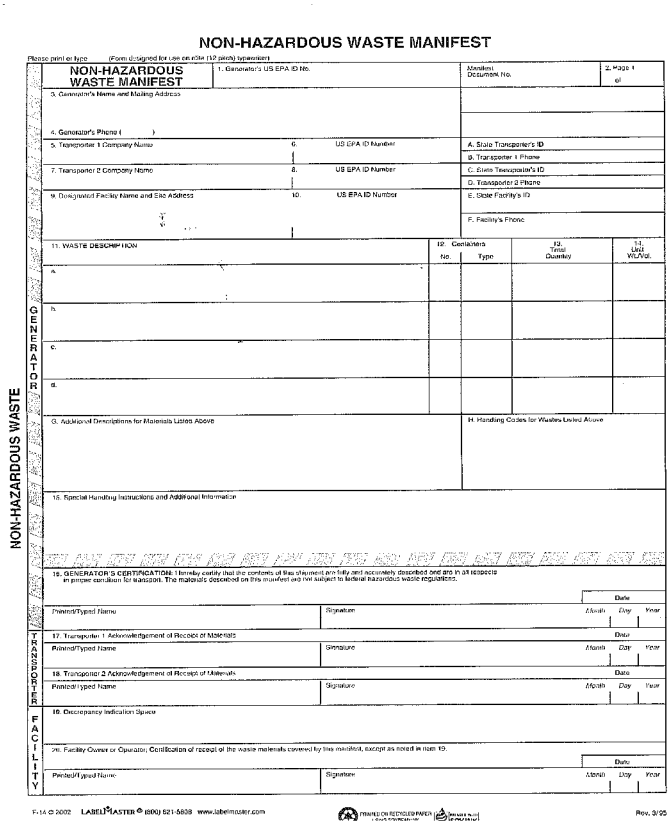
Purge Water Handling Procedure

Purpose

Control of non-hazardous purge water disposal. This procedure outlines the handling and disposing of non-hazardous purge water for the DELTA/COP portfolio.

Procedure

1) All purge and rinsate water will be contained in onboard truck tanks or trailers. Water may be commingled with other sites in the same portfolio of DELTA/COP sites.



2) A Non-Hazardous Waste manifest will be generated prior to leaving site.

3) All water will be offloaded into a commingled DELTA/COP tank at BLAINE facility.

4) Water will then be offloaded from the DELTA/COP tank and the BLAINE facility and transported to a disposal facility.

   For Southern California sites water will be disposed at Crosby and Overton in Wilmington, CA.
   For Northern California water will be disposed at Seaport Environmental in Redwood City, CA.

BASIS OF COORDINATES AND ELEVATIONS:

COORDINATES ARE CALIFORNIA STATE PLANE ZONE 3 COORDINATES FROM GPS OBSERVATIONS USING UNIVERSITY OF CALIFORNIA BAY AREA DEFORMATION CORS STATION OBSERVATION FILES AND BASED ON THE CALIFORNIA SPATIAL REFERENCE CENTER DATUM, REFERENCE EPOCH 2000.35.
COORDINATE DATUM IS NAD 83(1986).
DATUM ELLIPSOID IS GRS80.
REFERENCE GEOID IS NGS99.
CORS STATIONS USED WERE FARB AND DIAB.
VERTICAL DATUM IS NAVD 88 FROM GPS OBSERVATIONS.

Laboratory Analytical Reports with Chain-of-Custody Documentation

KIFF Analytical LLC

Report Number : 85300
Date : 07/04/2013

Laboratory Results

Nadine Periat
Antea Group
1155 North 1st Street, Suite 201
San Jose, CA 95112

Subject : 10 Soil Samples
Project Name : 76 Service Station No. 6390
Project Number : I40256390
P.O. Number : I40256390

Dear Ms. Periat,

Chemical analysis of the samples referenced above has been completed. Summaries of the data are contained on the following pages. Sample(s) were received under documented chain-of-custody. US EPA protocols for sample storage and preservation were followed. Testing procedures comply with the 2003 NELAC and TNI 2009 standards. Laboratory results relate only to the samples tested. This report may be freely reproduced in full, but may only be reproduced in part with the express permission of Kiff Analytical, LLC. Kiff Analytical, LLC is certified by the State of California under the National Environmental Laboratory Accreditation Program (NELAP), lab # 08263CA. If you have any questions regarding procedures or results, please call me at 530-297-4800.

Sincerely,

Troy G. Turpen

Analytical Lab Used and Report # (if any): Kiff Report Number 85300

1.	Were the analyses the ones requested?	Yes / No
2.	Do the sample number(s) on the chain-of-custody (COC) match the one(s) that appear on the laboratory data sheet?	Yes / No
3.	Were samples prepared (extracted, filtered, etc.) within EPA holding times?	Yes / No
4.	Once prepared/extracted, were the samples analyzed within the EPA holding times?	Yes / No
5.	Were Laboratory blanks performed, if so, were they non-detect?	Yes / No
6.	Are the units correct? (i.e., soil samples in mg/kg or ug/g, water samples mg/L, ug/L, and air samples in volume mg/m^3,etc.)	Yes / No
7.	Were appropriate Matrix Spike (MS) and Matrix Spike Duplicate (MSD) samples included in the laboratory batch sample?	Yes / No
8.	Were blank spike (SS or LCS) or blank spike duplicate (SSD or LCSD) samples included in the laboratory batch samples?	Yes / No
9.	Were QA/QC samples (MS/MSD, SS/SSD, LCS/LCSD) within the shown acceptable range of % recovery?	Yes / No
10.	Were MS/MSD (or SS/SSD) values used to calculate Relative Percent Difference (RPD)?	Yes / No
11.	Were Relative Percent Difference values within the acceptable range (i.e. ±25%)?	Yes / No
12.	Were surrogate recoveries within the acceptable range (i.e. ±30%)?	Yes / No

For a 'no' answer, explain why and what corrective action was taken (use additional sheet(s), as necessary:

Project Name : 76 Service Station 6390
Project Number : I40256390
P.O. Number : I40256390

Dear Mr. Umland,

Chemical analysis of the samples referenced above has been completed. Summaries of the data are contained on the following pages. Sample(s) were received under documented chain-of-custody. US EPA protocols for sample storage and preservation were followed. Testing procedures comply with the 2003 NELAC and TNI 2009 standards. Laboratory results relate only to the samples tested. This report may be freely reproduced in full, but may only be reproduced in part with the express permission of Kiff Analytical, LLC. Kiff Analytical, LLC is certified by the State of California under the National Environmental Laboratory Accreditation Program (NELAP), lab # 08263CA. If you have any questions regarding procedures or results, please call me at 530-297-4800.

Sincerely,

Troy G. Turpen

Case Narrative

Matrix Spike/Matrix Spike Duplicate results associated with sample SB-11 for the analyte Benzene were affected by the analyte concentrations already present in the un-spiked sample.

Sample SB-11 was received originally as MW-24. The sample name has been changed at the request of the client.

A version of this report was previously issued on 03/22/13. This revised version replaces that report.

Circle or Highlight Yes / No (below)

Analytical Lab Used and Report # (if any): Kiff Report Number 84362 revised

1.	Were the analyses the ones requested?	(Yes) / No
2.	Do the sample number(s) on the chain-of-custody (COC) match the one(s) that appear on the laboratory data sheet?	(Yes) / No
3.	Were samples prepared (extracted, filtered, etc.) within EPA holding times?	(Yes) / No
4.	Once prepared/extracted, were the samples analyzed within the EPA holding times?	(Yes) / No
5.	Were Laboratory blanks performed, if so, were they non-detect?	(Yes) / No
6.	Are the units correct? (i.e., soil samples in mg/kg or ug/g, water samples mg/L, ug/L, and air samples in volume mg/m^3,etc.)	(Yes) / No
7.	Were appropriate Matrix Spike (MS) and Matrix Spike Duplicate (MSD) samples included in the laboratory batch sample?	(Yes) / No
8.	Were blank spike (SS or LCS) or blank spike duplicate (SSD or LCSD) samples included in the laboratory batch samples?	(Yes) / No
9.	Were QA/QC samples (MS/MSD, SS/SSD, LCS/LCSD) within the shown acceptable range of % recovery?	(Yes) / No
10.	Were MS/MSD (or SS/SSD) values used to calculate Relative Percent Difference (RPD)?	(Yes) / No
11.	Were Relative Percent Difference values within the acceptable range (i.e. ±25%)?	Yes / (No)
12.	Were surrogate recoveries within the acceptable range (i.e. ±30%)?	(Yes) / No

For a 'no' answer, explain why and what corrective action was taken (use additional sheet(s), as necessary:

Matrix Spike/Matrix Spike Duplicate results associated with sample SB-11 for the analyte Benzene were affected by the analyte concentrations already present in the un-spiked sample.

Dear Mr. Umland,

Chemical analysis of the samples referenced above has been completed. Summaries of the data are contained on the following pages. Sample(s) were received under documented chain-of-custody. US EPA protocols for sample storage and preservation were followed. Testing procedures comply with the 2003 NELAC and TNI 2009 standards. Laboratory results relate only to the samples tested. This report may be freely reproduced in full, but may only be reproduced in part with the express permission of Kiff Analytical, LLC. Kiff Analytical, LLC is certified by the State of California under the National Environmental Laboratory Accreditation Program (NELAP), lab # 08263CA. If you have any questions regarding procedures or results, please call me at 530-297-4800.

Sincerely,

Troy G. Turpen

1,2-Dibromoethane	< 0.50	0.50	ug/L	EPA 8260B	05/21/13 15:58
Vinyl Chloride	< 0.50	0.50	ug/L	EPA 8260B	05/21/13 15:58
trans-1,2-Dichloroethene	< 0.50	0.50	ug/L	EPA 8260B	05/21/13 15:58
cis-1,2-Dichloroethene	< 0.50	0.50	ug/L	EPA 8260B	05/21/13 15:58
Trichloroethene	< 0.50	0.50	ug/L	EPA 8260B	05/21/13 15:58
Tetrachloroethene	< 0.50	0.50	ug/L	EPA 8260B	05/21/13 15:58
1,2-Dichloroethane-d4 (Surr)	99.0		% Recovery	EPA 8260B	05/21/13 15:58
Toluene - d8 (Surr)	98.9		% Recovery	EPA 8260B	05/21/13 15:58

Report Number : 84901

Date : 05/23/13

QC Report : Method Blank Data

Project Name : **256390**

Project Number :

Parameter	Measured Value	Method Reporting Limit	Units	Analysis Method	Date Analyzed
Tetrachloroethene	< 0.50	0.50	ug/L	EPA 8260B	05/22/13
Benzene	< 0.50	0.50	ug/L	EPA 8260B	05/21/13
Ethylbenzene	< 0.50	0.50	ug/L	EPA 8260B	05/21/13
Toluene	< 0.50	0.50	ug/L	EPA 8260B	05/21/13
Total Xylenes	< 0.50	0.50	ug/L	EPA 8260B	05/21/13
Diisopropyl ether (DIPE)	< 0.50	0.50	ug/L	EPA 8260B	05/21/13
Ethanol	< 5.0	5.0	ug/L	EPA 8260B	05/21/13
Ethyl-t-butyl ether (ETBE)	< 0.50	0.50	ug/L	EPA 8260B	05/21/13
Methyl-t-butyl ether (MTBE)	< 0.50	0.50	ug/L	EPA 8260B	05/21/13
Tert-Butanol	< 5.0	5.0	ug/L	EPA 8260B	05/21/13
Tert-amyl methyl ether (TAME)	< 0.50	0.50	ug/L	EPA 8260B	05/21/13
TPH as Gasoline	< 50	50	ug/L	EPA 8260B	05/21/13
1,2-Dibromoethane	< 0.50	0.50	ug/L	EPA 8260B	05/21/13
1,2-Dichloroethane	< 0.50	0.50	ug/L	EPA 8260B	05/21/13
Tetrachloroethene	< 0.50	0.50	ug/L	EPA 8260B	05/21/13
Trichloroethene	< 0.50	0.50	ug/L	EPA 8260B	05/21/13
Vinyl Chloride	< 0.50	0.50	ug/L	EPA 8260B	05/21/13
cis-1,2-Dichloroethene	< 0.50	0.50	ug/L	EPA 8260B	05/21/13
trans-1,2-Dichloroethene	< 0.50	0.50	ug/L	EPA 8260B	05/21/13
1,2-Dichloroethane-d4 (Surr)	98.1		%	EPA 8260B	05/21/13
Toluene - d8 (Surr)	98.7		%	EPA 8260B	05/21/13

Parameter	Measured Value	Method Reporting Limit	Units	Analysis Method	Date Analyzed
Benzene	< 0.50	0.50	ug/L	EPA 8260B	05/21/13
Ethylbenzene	< 0.50	0.50	ug/L	EPA 8260B	05/21/13
