Glossary of Terms & Qualifier Definitions

Client: Environ
Project: #03-33453C; Hines 2014
WorkOrder: 1411430

Glossary Abbreviation

95% Interval	95% Confident Interval
DF	Dilution Factor
DUP	Duplicate
EDL	Estimated Detection Limit
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
TEQ	Toxicity Equivalence

Analytical Qualifiers

a3	sample diluted due to high organic content.
d7	strongly aged gasoline or diesel range compounds are significant in the TPH(g) chromatogram
e2	diesel range compounds are significant; no recognizable pattern
e7	oil range compounds are significant

Quality Control Qualifiers

F1	MS/MSD recovery and/or RPD was out of acceptance criteria; LCS validated the prep batch.

FALI Job ID: A31409
Total Samples Submitted: 20
Total Samples Analyzed: 20

PLM Report Number: N/A

Sample Preparation and Analysis:

Samples were analyzed by the Air Resources Board's Method 435, Determination of Asbestos Content of Serpentine Aggregate. Samples were ground to 200 particle size in the laboratory. Approximately 1 pint was retained for analysis. Samples were prepared for observation according to the guidelines of Exception I and Exception II as defined by the 435 Method. Samples which contained less than 10% asbestos were prepared for observation according to the point count technique as defined by the 435 Method. This analysis was performed with a standard cross-hair reticle.

Sample ID	Lab Number	Layer Description
1830-G3-2	11581275	**Grey Soil**

Visual Estimation Results:

Matrix percentage of entire 100
Visual estimation percentage: **None Detected**
Asbestos type(s) detected: None Detected

Comment: This result meets the requirements of Exception I as defined by the 435 Method.

Sample ID	Lab Number	Layer Description

Note: Limit of Quantification (LOQ) = 0.25%. Trace denotes the presence of asbestos below the LOQ. ND = None Detected.

Analytical results and reports are generated by Forensic Analytical Laboratories Inc. (FALI) at the request of and for the exclusive use of the person or entity (client) named on such report. Results, reports or copies of same will not be released by FALI to any third party without prior written request from client. This report applies only to the sample(s) tested. Supporting laboratory documentation is available upon request. This report must not be reproduced except in full, unless approved by FALI. The client is solely responsible for the use and interpretation of test results and reports requested from FALI. Forensic Analytical Laboratories Inc. is not able to assess the degree of hazard resulting from materials analyzed. FALI reserves the right to dispose of all samples after a period of thirty (30) days, according to all state and federal guidelines, unless otherwise specified. All samples were received in acceptable condition unless otherwise noted.

Glossary of Terms & Qualifier Definitions

Client: Environ
Project: #03-33453C; Hines 2014
WorkOrder: 1411462

Glossary Abbreviation

95% Interval	95% Confident Interval
DF	Dilution Factor
DUP	Duplicate
EDL	Estimated Detection Limit
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
TEQ	Toxicity Equivalence

Analytical Qualifiers

a1	sample diluted due to matrix interference
a3	sample diluted due to high organic content.
e1	unmodified or weakly modified diesel is significant
e2	diesel range compounds are significant; no recognizable pattern
e7	oil range compounds are significant

Quality Control Qualifiers

F1	MS/MSD recovery and/or RPD was out of acceptance criteria; LCS validated the prep batch.

Glossary of Terms & Qualifier Definitions

Client: Environ
Project: #03-33453C; Hines 2014
WorkOrder: 1411462

Glossary Abbreviation

95% Interval	95% Confident Interval
DF	Dilution Factor
DUP	Duplicate
EDL	Estimated Detection Limit
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
TEQ	Toxicity Equivalence

Analytical Qualifiers

a1	sample diluted due to matrix interference
a3	sample diluted due to high organic content.
e1	unmodified or weakly modified diesel is significant
e2	diesel range compounds are significant; no recognizable pattern
e7	oil range compounds are significant

Quality Control Qualifiers

F1	MS/MSD recovery and/or RPD was out of acceptance criteria; LCS validated the prep batch.

Subject: Supplemental Phase II Environmental Site Assessment
Station Park Green
1700, 1750 and 1790 S. Delaware Street
San Mateo, California
Versar Project No. 105071.0053.002

Dear Mr. O'Shea:

Enclosed please find Versar, Inc.'s report titled Supplemental Phase II Environmental Site Assessment, Station Park Green, 1700, 1750 and 1790 S. Delaware Street, San Mateo, California (Site). This investigation has further assessed potential environmental liabilities initially identified in Versar's Phase I Environmental Site Assessment (ESA), dated December 13, 2013, and further investigated in Versar's Phase II ESA dated April 24, 2014. In the Phase I ESA, Versar identified the reasonable potential for environmental liabilities associated with the current and historical auto repair and gasoline dispensing operations at the current Shell station and former Montgomery Ward auto center (now a Michael's Arts and Crafts), as well as with a variety of historical industrial uses in the western portion of the Site. Off-Site impacts in groundwater from the western, up-gradient properties also appeared likely.

In the initial Phase II ESA Versar identified actionable concentrations in groundwater of benzene; Total Petroleum Hydrocarbons (TPH) in the gasoline, diesel and motor oil ranges; nickel, lead and cadmium; and the Volatile Organic Compounds (VOCs) 1,2-Dichloroethane (1,2-DCA) and Methylene Chloride. Actionable concentrations in soil were identified for TPH and lead. In soil vapor, the benzene concentration at the north side of the Shell station was elevated. A low concentration of polychlorinated biphenyls (PCBs) in soil was also identified behind the Michael's building. Direct assessment of the Shell station was not a part of the Phase II investigation.

In the attached Supplemental Phase II ESA, Versar further delineated the potential extent of soil and groundwater contamination identified in the Phase II ESA, and installed one boring in the former Montgomery Ward auto center to determine if a hydraulic fluid release to groundwater has occurred. The results of the investigation identified approximately 1,100 cubic yards of shallow soil south of the former Montgomery Ward auto center contaminated with actionable concentrations of TPH, and approximately 7,500 cubic yards of shallow soil in the southwestern portion of the site with actionable concentrations of TPH. Direct assessment of the Shell station was not a part of the supplemental Phase II investigation.

Perched groundwater contamination previously identified in one boring in the southwestern portion of the site during the initial Phase II investigation was determined not to be laterally extensive, and limited to the area of the initial sample. Actionable concentrations of nickel were identified at eight locations throughout the Site and appear to potentially be associated with high organic carbon concentrations or anaerobic conditions and a background condition, though one concentration adjacent to the Michaels building is significantly elevated. The groundwater sample collected beneath the former Montgomery Ward Auto center did not identify PCBs.

Versar appreciates the opportunity to support Essex Property Trust on this project. Please contact me at (916) 863-9323 should you have any questions or comments regarding this report.

Sincerely,

Tim Berger, P.G.

SECTION 1.0

EXECUTIVE SUMMARY

Versar, Inc. (Versar) has performed a Supplemental Phase II Environmental Site Assessment (ESA) of the Station Park Green property located at 1700, 1750 and 1790 S. Delaware Street, in San Mateo, San Mateo County, California (Site). This report has been prepared to conform with the scope and limitations of the American Society for Testing and Materials Standard Practice E1903-97, *Standard Guide for Environmental Site Assessments: Phase II Environmental Site Assessment Process*.

The Phase II investigation and this Supplemental Phase II Investigation have been performed to assess the extent of contamination of Site soil and groundwater associated with issues of concern identified in a Phase I ESA conducted of the Site by Versar in December 2013. Issues of environmental concern that were identified in the Phase I ESA are summarized below:

- LOC #1 – Shell's Historical Auto Repair Operations and Gasoline Dispensing. Residual total petroleum hydrocarbons (TPH) in groundwater from the removal of the underground storage tanks (USTs) and hydraulic hoists at the Shell station include benzene at 45 micrograms per liter (µg/L), which exceeds the Environmental Screening Level (ESL) for residential use of 27 µg/L. Groundwater impacts from the hydraulic lift location included up to 2,200 µg/L of TPH-gasoline (TPH-g) at the time of case closure. Although both release cases from the Shell station are closed, the residual groundwater impacts above the action level represent a potential vapor encroachment condition (pVEC) and Recognized Environmental Condition (REC) to the Site. Also, a clarifier was associated with the Shell station car wash but had not been assessed to date, representing an REC

  In December 2014, the Shell Service Station was demolished and all buildings and appurtenances removed. During the Shell station removal, performed on behalf of Shell by others, petroleum-impacted soil and groundwater were encountered, removed and disposed off Site.

.

- LOC #2 – Incomplete Closure for Waste Oil Tank at Shell. In March 1987, a 550-gallon waste oil UST was removed from the south side of the Shell service station and a double-walled waste oil UST was reported to be installed adjacent to the removed waste oil UST. Samples were collected during the 1987 waste oil UST removal; however, no regulatory close out documentation was identified from the files Versar reviewed. According to the AECOM 2011 Phase I ESA, a double-walled waste oil tank that was installed in 1987 was reportedly removed from the Shell service station in 2006. The absence of close out documentation from the waste oil UST removals (1987 and 2006) present a REC to the Site.

- LOC #3 – Former Montgomery Ward Auto Service Center. At the former Montgomery Ward auto service center (now occupied by Michaels), the waste oil tank on the east side of the former auto center has been closed by the County, but was not assessed for solvents such as chlorinated volatile organic compounds (CVOCs), which are likely to be contained within a waste oil tank since waste oil tanks from automotive operations

comprise a variety of materials, including VOCs. Hydraulic lifts were likely present in the Montgomery Ward auto service center in the 1970s. No record of the removal of the lifts or any of the auto service center materials has been identified. A release of hydraulic fluid from the lifts is reasonably likely, and could contain polychlorinated biphenyls (PCBs). An oil/water separator on the south side of the Michaels building has not been assessed and could present environmental liabilities based on the former auto service center usage at this location. The incomplete UST closure and the absence of facility closure data regarding the former hydraulic lifts and oil/water separator represent an REC and pVEC to the Site.

- LOC #4 – Kmart Elevator. A piston-style hydraulic elevator services the two floors of the Kmart building and was installed in the early 1970s. A release of hydraulic fluid from the piston casing is reasonably likely, and could contain PCBs. No evidence of a release was identified in three grab-groundwater samples collected outside the building in the perceived down-gradient direction from the elevator.

- LOC #5 – On and Off-Site Sand/Gravel/Asphalt Operations with Oil Tanks. The historical use of the strip of land that adjoins the Site to the west (east of the Caltrans rail) included sand and gravel operations, an asphalt plant and a truck repair building. Sanborn maps depict multiple oil tanks and other features of concern, a few of which were located on the Site, with the rest adjoining the Site in an up-gradient direction. City of San Mateo Fire Department records indicated that three underground fuel storage tanks were installed at the asphalt plant in 1961. The plant facilities (including four additional above-ground tanks for fuel oil and asphalt) were demolished in 1973 by Concar Enterprises. No information was identified that indicates whether or not the tanks were removed from the site. These potential sources of petroleum impact to groundwater are adjacent and directly upgradient from the Site.

- LOC #6 – Off-Site Caltrain Corridor. The Caltrain Corridor (SF to Santa Clara) adjoins portions of the west end of the Site and is reported to contain TPH and metals in soil. TPH in groundwater is likely to occur within the corridor. The Caltrain corridor is within the ASTM Critical Distance of the Site. Based on the corridor location within the Critical Distance of the Site with similar impacts that have been identified at the Site, the Caltrain corridor presents an off-Site REC and pVEC to the Site.

- LOC #7 – Off-Site Vail Burner & Oil Company. Contamination of groundwater by the Vail Burner & Oil Company west of the adjoining Caltrain corridor is documented and has not been defined to the east, toward the Site. Two monitoring wells closest to the Site are impacted by TPH-diesel and CVOCs. The TPH-d and CVOC impacts from this facility have not been defined to the east (toward the Site) and as such, this facility represents an off-Site REC and pVEC to the Site.

SECTION 2.0

BACKGROUND INFORMATION

Versar, Inc. (Versar) has performed a Supplemental Phase II Environmental Site Assessment (ESA) of the Station Park Green property located in San Mateo, Santa Mateo County, California (Site). The Site location is shown in Figure 1, Site Location Map. The purpose of the Supplemental Phase II ESA is to further investigate locations of concern (LOCs) related to Site operations identified in Versar's Phase I ESA dated December 13, 2013 and Versar's initial Phase II ESA dated April 21, 2014.

The scope of work for this project included collecting soil and groundwater samples from ten soil and nine groundwater borings to assess whether and to what extent contaminants exist at the Site at actionable concentrations. LOCs addressed through the Phase II ESA and Supplemental Phase II ESA include historical auto repair, gasoline dispensing operations and apparently incomplete closure of a waste oil tank at the Shell Service Station; assessing a closed waste oil tank at the east side of the former Montgomery Ward auto service center (now occupied by Michaels Arts & Crafts) for chlorinated Volatile Organic Compounds (VOCs), as well as an assessment of hydraulic lifts and an clarifier at this former auto service center; assessment of piston-style hydraulic elevators at the Kmart building; and assessing subsurface conditions at the west end of the Site from historical on and off-Site sand/gravel/asphalt operations with oil tanks; and off-Site releases of Total Petroleum Hydrocarbons (TPH) from the west adjoining Caltrain Corridor and Vail Burner & Oil Company areas.

The boring and LOC locations are depicted on Figure 2, Investigation Layout Map.

2.1 Background

The Site is located at 1700, 1750 & 1790 South Delaware Street, San Mateo, San Mateo County, California and developed with a Shell gas station, Michaels and Kmart retail stores and Gazillion Entertainment, an online video game developer. The Site is located in a mixed-use area of San Mateo and is bounded by Concar Street to the southeast, South Delaware Street to the northeast, AAA auto club and the United States Post Office to the north to northwest, and the Hayward Park Caltrain station to the west to southwest. The Site consists of two parcels, assessor's parcel numbers (APNs) 035-200-180 and 035-200-060, totaling approximately 11.4 acres and 0.5-acre, respectively.

2.2 Site Physical Setting

The Site is located in the Santa Clara Valley, which is a structural low associated with the southern end of the San Francisco Bay. Topography of the Site and surrounding area is characterized by relatively flat terrain with a gentle slope eastward to San Francisco bay. According to the United States Geological Survey (USGS) 7.5-minute series topographic map of the San Mateo, California Quadrangle, 1999, the Site is approximately eight feet above mean sea level (msl). The Site soil profile comprises 1.3 to 8.5 feet of fill overlying former estuarine marshland. Fill material is highly variable, comprising from gravel, sand and clay, typically with clay. Underlying marsh deposits comprise one to six feet of Bay Mud with organics. Underlying alluvium comprises proximal and distal fan deposits of anastomosing gravel, sand, silt and clay. The depth to groundwater varies across the Site, with elevation and encountered alluvium. In

environmental borings first encounter has ranged from 15 to 23 feet below present grade surface (bgs), stabilizing at 16 to 18 feet bgs. In geotechnical borings groundwater has been encountered from 6.4 – 9.2 feet bgs.

2.3 Purpose

The purpose of the Phase II ESA and Supplemental Phase II ESA is to investigate whether, and to what extent, current and historical operations related to various auto repair, gasoline dispensing and storage and handling of hazardous materials at the Site have impacted soil, soil vapor and groundwater.

2.4 Scope of Work

In response to the recognized environmental conditions (RECs) identified in Versar's December 2013 Phase I ESA, and in conformance with a work plan submitted to the San Mateo County Environmental Health Division (SMCEHD); Versar conducted an initial soil, soil vapor and groundwater investigation of the Site, described in a Phase II Investigation report dated April 21, 2014. The findings of the Phase II Investigation report identified soil and groundwater contamination and a supplemental investigation was performed to delineate the contamination. Prior to initiating the field work, the following limitation was provided by the current owner of the Site, ARJAX II Railroad of San Mateo, California, c/o EBL&S Property Management, Inc. of Philadelphia, Pennsylvania:

- No borings were to be allowed within the Shell service station grounds.

PeneCore Drilling of Woodland, California provided drilling services from November 3 - 4, 2014. One additional boring located inside the former Montgomery Ward automotive service center was drilled by Enprobe of Oroville, California on November 18, 2014. All borings were hand augered to five feet bgs for safety purposes.

The tasks completed are listed below. Boring locations are depicted in Figures 2 through 4.

2.4.1 Soil, Soil Vapor and Groundwater Investigation

LOCs #1 and 2 – Shell's Historical Auto Repair Operations and Gasoline Dispensing

Using direct push technology (DPT), Versar assessed the features of interest of LOC #1 by advancing one boring (B18) in the former waste oil tank area. One grab-groundwater sample was collected to assess the northern extent of actionable 1,2-dichloroethane (1.2-DCA), fuel hydrocarbons and nickel.

The groundwater sample was analyzed for VOCs by EPA Method 8260B, nickel by EPA Method 6020 and TPH in the diesel (-d), motor oil (-mo) and gasoline (-g) ranges by EPA Method 8015M.

LOC #3 – Former Montgomery Ward Auto Service Center/Michaels

Versar installed five (5) borings in the LOC 3 area. One boring (B21) is within the building, ostensibly between the two former hydraulic lift pistons. Two soil samples and one grab-groundwater sample were collected to assess if a leak of hydraulic fluid has occurred from

5330 Primrose Drive, Suite 147
Fair Oaks, CA 95628
916.962.1612
www.versar.com

piston seal and casing failure. Hydraulic fluid can contain PCBs, which were identified by Versar in a previous soil sample behind the current Michaels building.

The southern two borings (B22 and B23) are step-outs from an apparent release from the clarifier south of the Michaels building, also associated with the former Montgomery Ward auto service center operation. TPH was previously identified in soil less than 5 feet deep at the west end of the clarifier. A soil sample was collected from the western location (B23) and analyzed for TPH – full range, VOCs, nickel and lead. Grab-groundwater samples were collected from each boring and tested for TPH, VOCs and nickel; the sample from boring B23 was also analyzed for lead.

The northern two borings (B19 and B20) relate to a former waste oil UST. Soil and groundwater samples were collected from the boring located just outside the northwest corner of the Shell station (B19) and analyzed for VOCs, TPH, lead and nickel to assess the southern extent of contamination previously identified just north of the Shell station. The grab groundwater sample from Boring B20 was collected specifically to assess the lateral extent of methylene chloride, lead and nickel identified in groundwater by Versar's March 2014 Phase II ESA.

Versar collected a total of three soil samples and five grab groundwater samples from the five borings at LOC #3.

LOC's #5 and 6 – On and Off-Site Sand/Gravel/Asphalt Operations with Oil Tanks and Caltrain Corridor

LOC 5 is potentially impacted by historical use by Concar Enterprises and the Caltrain Rail Corridor. During the initial Phase II ESA, very high concentrations of TPH and indications of free product were encountered at a depth of four feet in shallow, perched groundwater in the southwest portion of this LOC. Versar collected grab-groundwater samples from three step-out borings (B31, B32 and B33) to assess the lateral extent of the impacted, perched groundwater. The grab groundwater samples were analyzed for Full Range TPH.

To the north and northwest in LOC 5, elevated concentrations of TPH in the gasoline through oil ranges were detected in shallow soil between the surface and a depth of five (5) feet. To assess the lateral extent of this impacted area and further characterize the TPH concentrations over this large area, Versar collected shallow soil samples from seven soil borings (B24 through B30).

Boring logs were prepared for all borings and are presented in Appendix A.

2.4.2 Shell Service Station Removal Monitoring

From December 5 through 18, 2014 Versar observed the demolition of the Shell service station and removal of all known appurtenances, above and below ground, including the removal of USTs, fuel dispenser catch basins and fuel piping, and petroleum-impacted soil and groundwater. Versar collected split samples of soil and water from the station removal environmental consultant during the abandonment. A report documenting Versar's observation and split sampling results is included in Appendix B.

SECTION 3.0

FIELD INVESTIGATION

3.1 Permitting

A boring permit was obtained from the SMCEHD. A copy of the permit is provided in Appendix C.

3.2 Utility Clearance

Utility clearance for the Site comprised marking the investigation area, notifying Underground Service Alert (USA) (Ticket #0093795), and performing private utility searches on November 3 and November 18, 2014. Underground utilities within public rights of way were identified and marked by USA. Specific boring locations within the property were cleared by a private utility locator. Borings B25, B27, B28 and B29 had to be relocated approximately 10 feet west of the original location due to the presence of an underground water line. No utilities were encountered during the investigation.

3.3 Project Health and Safety

Versar prepared a Site-specific health and safety plan (HSP) prior to performing the field investigation. A Site Safety Officer (SSO) was designated during the field investigation. The SSO was responsible for adherence to the HSP and was present during all field activities. The HSP was presented, reviewed and signed by field personnel. The HSP field documentation is provided in Appendix D.

3.4 Decontamination Procedures

Down-hole equipment including drilling rods, bits and sampling equipment was thoroughly cleaned before and after the drilling of each borehole. Equipment was cleaned with water and laboratory-grade, non-phosphate surfactant, and double rinsed, or high-pressure washed. Wastewater generated during this process was stored on Site in appropriate containers pending disposal. Clean, disposable gloves were worn by all field personnel when handling decontaminated equipment.

3.5 Field Screening

Soil samples were field screened using a Photo-Ionization Detector (PID). The PID was calibrated before use in the field. The calibration was performed using a reference gas of 100 parts per million (ppm) isobutylene, which is the standard for fuel hydrocarbon screening. The PID utilized a 10.6 eV lamp which provides the most direct reading of fuel hydrocarbons and related aromatics.

The results of PID field screening, as well as visual indicators of contamination such as staining, sheen, and product presence as encountered, were used in selecting soil samples for laboratory analysis, and documented on the boring logs presented in Appendix A.

5330 Primrose Drive, Suite 147
Fair Oaks, CA 95628
916.962.1612
www.versar.com

3.6 Field Activities

Field activities were performed during November 3-4 to November 18, 2014 and comprised 16 borings within the boundaries of the Site; and collecting soil and groundwater samples for laboratory analysis. Table 1 in Section 4.0 summarizes the sample locations and analytical tests for each location.

3.6.1 Soil Borings

Most of the soil borings were advanced by first using the drill rig to bore asphalt paving. Inside the Michaels building, the concrete floor was cored for Boring B21. All soil borings for soil and groundwater sampling were initially advanced to five feet by hand auger to avoid damage to unknown utilities. The remainder of each boring was advanced with a direct-push drill rig. Borings B19, B21 and B23 were advanced from five feet bgs to approximately 25 feet bgs with a direct push drill rig using dual-tube tooling (to allow collection of soil samples); a temporary well casing was installed in each boring, and a grab groundwater sample was collected. In addition to the grab groundwater samples, one soil sample per boring was collected from borings B19, B21 and B23.

For borings B-18, B20, B22, B31, B32 and B33 a Hydropunch device was advanced to 25 feet bgs with a direct-push drill rig and a grab-groundwater sample collected. Hydropunch tooling was used to avoid contamination of the sample with perched water previously encountered at four feet bgs.

The locations of soil samples are shown on Figures 2 through 4. Borings were extended to depths ranging between 10 and 28 feet bgs. A drilling log was created for each boring describing the soil profile, sample collection locations, field observations and PID readings. The boring logs are presented in Appendix A.

Each soil boring was abandoned per permit requirement by filling with neat cement containing up to five percent powdered bentonite. Borings in which groundwater was encountered were filled using a Tremie pipe. Borings were filled to the surface, allowed to settle and topped off. Soil cuttings and decontamination water were contained in one 55-gallon Department of Transportation (DOT)-approved drum for later disposal. The drum was labeled as non-hazardous waste with appropriate information including the contents and date of collection. The waste-containing drum was stored in a secure location on Site until removal and disposal based on its waste characteristics.

3.6.2 Soil Sampling

A total of 30 soil samples were collected from borings B19, B21, and B23 through B30. Soil samples were collected at predetermined depths, or when field observation of odor, unusual soil color or staining indicated potential contamination. All soil samples were screened using a photoionization detector prior to collection.

Samples collected by hand-augering were retained in stainless steel sleeves, with exposed sleeve ends covered with Teflon sheeting and each end capped with a pressure-fitted plastic cap. Samples collected by direct push were retained within the acetate liner of the direct push sample barrel. Samples cut from the liner were sealed, with exposed liner ends covered with Teflon sheeting and each end capped with a pressure-fitted rubber cap. The samples were separately contained in new, re-sealable plastic bags placed on ice in a cooler prior to

transferring custody to the contract laboratory. All samples were handled following chain-of-custody protocols, from collection through analysis.

3.6.3 Groundwater Sampling

Grab-groundwater samples were collected from boring B18 through B23 and borings B31 through B33. In borings B19, B21 and B23 a 0.020-slotted polyvinyl chloride (PVC) pipe was inserted into the boring to allow continued access to the water-bearing unit. Well screens were set at 25 feet bgs in boring B19 and B23, and at 28 feet bgs in boring B21. Grab groundwater samples were collected from borings B18, B20, B22, B31, B32 and B33 by driving a Hydropunch sampler to the target depth, and retracting the rods to expose the screen. Grab-groundwater samples were collected at each location by gently lowering a pre-cleaned, polyethylene bailer into the groundwater, recovering the water-filled bailer and carefully decanting the sample into the appropriate sample container, with preservative as appropriate. Metals samples were not preserved in the field, and were laboratory-filtered before analysis.

3.7 Storage and Disposal of Wastes

Wastes collected during the investigation comprised soil cuttings. All collected wastes were placed into a 55-gallon, DOT-approved drum and stored at the Site pending disposal. The wastes collected and stored at the Site comprised one drum of soil. The contents of the drum and the date of collection were clearly marked on an appropriate label.

SECTION 4.0

LABORATORY ANALYSIS

Selected soil and groundwater samples were submitted to a California state-certified laboratory for chemical analyses: SunStar Laboratories, Inc. (SunStar), (Environmental Laboratory Accreditation Program [ELAP] Certificate No. 2250). Samples were analyzed within instrument and accuracy limits defined by the method. The samples were collected, placed in containers, preserved and analyzed within the time constraints consistent with applicable USEPA, California EPA, and industry practices. Samples were delivered under Versar's chain-of-custody protocol; custody of the samples began at the time of sample collection and was maintained by the sampling team until the samples were relinquished to the laboratory. The samples were analyzed as follows:

TABLE 1:

SECTION 5.0

INVESTIGATIVE FINDINGS

The findings of the Supplemental Phase II ESA are presented in the following sections. Tabulated analytical results are presented in Tables 2 and 3. The laboratory analytical report and chain-of-custody documentation are included in Appendix E. Regulatory screening criteria used were the San Francisco Regional Water Quality Control Board Environmental Screening Levels (SF RWQCB ESLs – Residential, December 2013), California Human Health Screening Levels (CHHSLs – 2010) and U.S. EPA Region 9 RSLs (November, 2013). Sample results were compared to residential cleanup criteria.

5.1 Soil Samples

TPH Analysis

Gasoline-range hydrocarbons (TPH-g) were detected in soil samples collected from borings B19, B26 and B30. The highest concentration, 340 milligrams per kilogram (mg/kg), was detected in the sample collected from boring B30 (Sand/Gravel/Asphalt Plant) at nine feet bgs. This concentration exceeds the SFRWQCB ESL for TPH-g of 100 mg/kg. Soil samples collected at depths of 3.5 feet, 12 feet and 15 feet bgs did not contain gasoline range hydrocarbon concentrations above the reporting limit of 10 mg/kg.

Two soil samples collected from boring B26 at depths of 8 and13 feet bgs contained TPH-g at concentrations of 79 mg/kg and 110 mg/kg, respectively. A third sample collected from boring B26 at a depth of 15 feet bgs did not contain gasoline range hydrocarbon concentrations above the reporting limit of 10 mg/kg. The concentration in the 8-foot sample exceeds the SFRWQCB ESL for TPH-g of 100 mg/kg.

One soil sample collected from boring B19 (outside the northwest corner of the Shell station) contained TPH-g (12 mg/kg) but did not exceed the SFRWQCB ESL. Soil samples collected at depths of 5 feet and 11 feet bgs did not contain gasoline range hydrocarbon concentrations above the reporting limit of 10 mg/kg.

Diesel-range hydrocarbons (TPH-d) were detected in 10 samples at concentrations ranging from 12 mg/kg to 170 mg/kg. The SFRWQCB ESL for TPH-d of 100 mg/kg was exceeded at two locations. The exceedances were at the former Sand/Gravel/Asphalt Plant borings B28 and B30. Boring B28 had a concentration of 170 mg/kg at a depth of 3.5 feet bgs. A second sample from B28 contained a concentration of 23 mg/kg at a depth of 8 feet bgs. A third sample from B28 did not contain diesel range hydrocarbon concentrations above the reporting limit of 10 mg/kg.

Boring B30 had a TPH-d concentration of 4,100 mg/kg at a depth of 9 feet bgs and a concentration of 3,700 mg/kg at the 12 foot bgs depth. TPH-d at the B30 sample locations of 3.5 and 15 feet bgs did not contain diesel range hydrocarbon concentrations above the reporting limit of 10 mg/kg.

Concentrations of TPH-d below the SFRWQCB ESL were detected in samples collected from borings B19, B24, B25, B26, B27 and B29, with concentrations ranging from 12 to 93 mg/kg.

5330 Primrose Drive, Suite 147
Fair Oaks, CA 95628
916.962.1612
www.versar.com

The highest concentrations of TPH-d were generally detected in the upper five feet of soils in the former Sand/Gravel/Asphalt Plant area.

Motor oil-range hydrocarbons (TPH-mo) were detected in 10 soil samples at concentrations ranging from 12 to 30,000 mg/kg. The SFRWQCB ESL for TPH-mo of 100 mg/kg (Residential) was exceeded in nine locations. The highest concentrations of TPH-mo were detected in samples from boring B30 (Sand/Gravel/Asphalt Plant) at 9 feet and 12 feet bgs. Concentrations of 30,000 mg/kg and 22,000 mg/kg were detected at 9 feet and 12 feet bgs, respectively. A sample collected from 15 feet bgs in boring B30 did not contain TPH-mo concentrations above the reporting limit of 10 mg/kg.

A TPH-mo concentration 680 mg/kg was detected in boring B28 (Sand/Gravel/Asphalt Plant) at a depth of 3.5 feet bgs. Deeper samples collected from boring B28 at depths of 8 feet (84 mg/kg) and 15 feet bgs (not detected above the reporting limit of 10 mg/kg) did not exceed the ESL. Samples from boring B29 collected at 2.5 feet, 5 feet and 7 feet bgs contained concentrations of 310 mg/kg, 170 mg/kg and 58 mg/kg, respectively. A fourth sample collected from boring B29 did not detect TPH-mo above the reporting limit of 10 mg/kg. Samples collected from boring B25 at 2.5 feet bgs, B27 at 2.5 feet bgs, B24 at 5 feet bgs, and B26 at 2.5 feet bgs detected TPH-mo concentrations of 260 mg/kg, 200 mg/kg, 140 mg/kg and 100 mg/kg, respectively.

Concentrations of TPH-mo below the SFRWQCB ESL were also detected in shallow soil samples collected from boring B19 at 5 feet bgs (outside the northwest corner of the Shell station) and boring B24 at 2.5 feet bgs (Sand/Gravel/Asphalt Plant), with concentrations of 50 and 49 mg/kg, respectively.

VOC Analysis

No VOCs were detected at or above laboratory reporting limits in soil samples collected from borings B19 or B23.

PCB Analysis

No PCBs were detected at or above laboratory reporting limits in two soil samples collected from boring B21, located beneath the former Montgomery Ward Auto Service Center.

Metals Analysis

Concentrations of lead below screening levels were detected in two soil samples collected from boring B19 (B-19-5 and B-19-8). The detected lead concentrations ranged from 6.6 mg/kg to 8.9 mg/kg. One sample from boring B19 (B-19-11) and two samples from boring B23 (B-23-8 and B-23-12) did not contain lead concentrations above the reporting limit of 3.0 mg/kg.

Concentrations of nickel below screening levels were detected in three soil samples collected from boring B19 (B-19-5, B-19-8 and B-19-11) and two soil samples collected from boring B23 (B-23-8 and B-23-12). Nickel concentrations ranged from 18 mg/kg to 64 mg/kg.

The analytical results for TPH, VOCs, PCBs, nickel and lead were compared to the SFRWQCB ESLs and are presented in Table 2 of this report. No concentrations of VOCs, PCBs and metals in soil exceeded regulatory screening levels. Figure 3 illustrates the detected concentrations of analytes in soil samples that exceed applicable screening levels.

5.2 Groundwater Samples

TPH Analysis

Concentrations of TPH were identified in one groundwater sample collected from boring B19, north of the Shell Station, and collected from boring B33, near the former Sand/Gravel/ Asphalt Plant. The B19 location comprised a TPH-g concentration of 1,100 micrograms per liter (µg/L) and a TPH-d concentration of 540 µg/L. The B33 location comprised a TPH-d concentration of 670 µg/L. Each of the concentrations exceeded the SFRWQCB ESL of 100 µg/L for the respective TPH ranges.

No other concentrations of TPH exceeding applicable ESLs were identified in groundwater samples.

VOC Analysis

Concentrations of VOCs exceeding ESLs were not identified in groundwater samples.

Concentrations of VOCs below action levels included methylene chloride (4.3 µg/L) and chloroform (11 µg/L) at the boring B20 location (near the northwest corner of the Shell station). At the boring B22 location (former Montgomery Ward Auto Service Center), methylene chloride (2.7 µg/L) and chloroform (10 µg/L) were detected. At the boring B23 location in this area bromochloromethane (3.7 µg/L), bromodichloromethane (11 µg/L), chloroform (88 µg/L), chloromethane (1.4 µg/L), dibromochloromethane (2.4 µg/L), dibromomethane (2.9 µg/L) and methylene chloride (54 µg/L) were identified.

PCB Analysis

No PCBs were detected at or above laboratory reporting limits in the groundwater sample collected from boring B21, in the projected area of the former Montgomery Ward hydraulic lifts.

Metals Analysis

An actionable concentration of nickel was identified in the sample collected from boring B23. Nickel exceeded the California drinking water goal of 100 µg/L, at a concentration of 2,300 µg/L. Lead was not identified in the collected groundwater samples.

5.3 Shell Service Station Removal

Soil

Several soil samples collected during the initial characterization sampling event on December 5 exceeded EPA Region 9 Environmental Screening Levels (ESLs) and San Francisco Bay Regional Water Quality Control Board (SF RWQCB) ESLs for residential use, with concentrations of gas-range total petroleum hydrocarbons (TPH-g), naphthalene, benzene, xylenes, tertiary butanol (TBA) and methyl tertiary-butyl ether (MTBE) as high as 430 milligrams per kilogram (mg/kg), 2.9 mg/kg, 3.0 mg/kg, 3.2 mg/kg, 0.19 mg/kg and 0.18 mg/kg, respectively.

Because the data obtained from the December 5 sampling event was used to guide the over-excavation, most of the soil characterized during the December 5 sampling event was

subsequently excavated and removed from the Site: All piping trench, dispenser catch basin and north UST pit wall areas were over-excavated and removed. This includes all soil characterized by samples PT1-6' through PT12-6', UDC 1/2-6' through UDC 7/8-6' and T1N-7' through T3N-8'.

Samples collected from soil remaining in the south UST pit wall exhibited concentrations of benzene, TBA and MTBE as high as 0.11 mg/kg, 0.15 mg/kg and 0.18 mg/kg, respectively. This soil was not over-excavated due to proximity to the property line, sidewalk and street.

Soil samples collected from the area of the hydraulic hoists and hoist-associated clarifier exhibited benzene concentrations as high as 0.54 mg/kg. The central hoist and the hoist-associated clarifier areas were over-excavated; subsequent confirmation samples collected from these areas did not exceed regulatory screening levels for compounds of concern.

Versar's split sample "Hoist 3 – 9'", collected from beneath the northern hoist exceeded SF RWQCB ESLs for TPH-diesel, TPH-hydraulic fluid and TPH-motor oil, with concentrations of 2,400 mg/kg, 3,000 mg/kg and 2,500 mg/kg, respectively. This sample did not exhibit greater odor or staining than other samples collected in this area. No further over-excavation was performed at the northern hoist.

As over-excavation progressed, confirmation samples were collected from over-excavated areas, primarily the floor of the excavation. Several samples collected from the floor of the dispenser area and northern UST pit area exceeded the EPA Region 9 and SF RWQCB ESLs for benzene, with concentrations as high as 2.4 mg/kg. Several samples exceeded the SF RWQCB ESL for TBA, with concentrations as high as 0.37 mg/kg, and sample EX8-6.5' exceeded the SF RWQCB ESL for MTBE with a concentration of 0.071 mg/kg. The soil characterized by these confirmation samples was not over-excavated.

Groundwater

The initial water sample collected from the UST pit exceeded SF RWQCB ESLs for aquatic toxicity and drinking water Maximum Contaminant Levels (MCLs) for TPH-gas, TPH-diesel, benzene, toluene, ethylbenzene and xylenes, with concentrations of 24,000 micrograms per liter (ug/L), 1,300 ug/L, 810 ug/L, 8,300 ug/L, 1,300 ug/L and 7,900 ug/L, respectively; the sample also exceeded the ESL for naphthalene, with a concentration of 190 ug/L, and the drinking water MCL for MTBE, with a concentration of 22 ug/L. A subsequent water sample was collected after dewatering approximately 40,000 gallons from the tank pit, a substantial portion of which was due to precipitation. The second water sample exceeded the SF RWQCB drinking water MCL for benzene, with a concentration of 3.8 ug/L; all other compounds of concern were below their respective screening levels.

SECTION 6.0

CONCLUSIONS AND RECOMMENDATIONS

Versar, Inc. (Versar) has performed a Supplemental Phase II Environmental Site Assessment (ESA) of the Station Park Green property located 1700, 1750 and 1790 S. Delaware Street in San Mateo, San Mateo County, California (Site). This report has been prepared to conform to the scope and limitations of the American Society for Testing and Materials Standard Practice E1903-97, *Standard Guide for Environmental Site Assessments: Phase II Environmental Site Assessment Process*. The results of the initial and Supplemental Phase II ESAs have identified and characterized several locations where concentrations of contaminants of concern in soil and groundwater exceed applicable action levels (SFRWQCB ESLs).

At the north side of the Shell station, the initial Phase II ESA identified actionable concentrations of benzene (640 µg/L), nickel (up to 1,700 µg/L) methylene chloride, 1,2-DCA and lead in groundwater samples collected from borings advanced next to a car wash clarifier and a former waste oil tank (borings B1 and B3). The high levels of benzene and nickel indicated an apparent release from one or more of the Shell service station features. Groundwater samples collected from three supplemental borings (B18, B19 and B20) did not further identify elevated concentrations of benzene, nickel or VOCs north of the Shell station area. However, a groundwater sample collected from boring B19, located north of boring B3, identified actionable concentrations of TPH-g and –d, suggesting a release has occurred from a source in that area. Soil samples collected from boring B19 did not identify concentrations of contaminants exceeding their respective ESL.

Borings B22 and B23 were sampled to further delineate an apparent release of TPH in the oil and diesel range that has impacted mostly soil at the south side of the Michael's (former Montgomery Ward auto service center) building. Based on the soil data from this area an estimated 1,100 cubic yards of shallow soil has been impacted with TPH. An actionable concentration of lead was previously identified in a soil sample near the southwest corner of the Michaels, but was not identified elsewhere. Soil at the oil/water separator location (B5 and B6) was vertically delineated; indicating the TPH impacts appear localized to the shallow soil profile adjacent to the clarifier. Versar recommends removal and appropriate disposal of impacted soil from the area delineated by borings B4 – B6. Evidence of groundwater impact by TPH was noted in one sample (B6 at 170 µg/L), and nickel (B23) at 2,300 µg/L.

Soil and groundwater samples collected from beneath the former Montgomery Ward auto service center identified soil contaminated with TPH-d and -mo between 6 and 12 feet bgs. The detected soil contamination exceeded the ESLs for TPH-d and –mo. The soil contamination is likely associated with former lifts. PCBs were not detected at this location.

Groundwater samples were collected from three borings (B31, B32 and B33) near the southwestern corner of the Site to delineate concentrations of TPH-g, -d and -mo exceeding action levels in boring B12. Boring B33 identified 670 µg/L of TPH-d in groundwater approximately 50 feet southeast of boring B12. Groundwater samples collected from borings B31 and B32, located approximately 50 feet northwest and northeast, respectively, did not identify actionable concentrations of contaminants. Groundwater contamination at this location appears to be restricted to the area surrounding boring B12, extending and decreasing southeast along the property boundary to the B33 area.

5330 Primrose Drive, Suite 147
Fair Oaks, CA 95628
916.962.1612
www.versar.com

Shallow soil impacts of TPH as gas, diesel and oil were identified at multiple locations in the southwestern portion of the Site. Soil samples collected in this area identified deeper soil contamination (at 9 and 12 feet bgs) at one location, boring B30. Elsewhere in this area, actionable TPH concentrations appear limited to the upper five feet of the subsurface. The volume of petroleum-impacted soil is estimated to be 7,500 cubic yards. Versar recommends removal and appropriate disposal of impacted soil, which may be performed during Site grading activities prior to redevelopment construction.

Nickel in groundwater exceeded applicable ESL at eight locations throughout the Site with concentrations ranging from 11 to 2,300 µg/L. The two highest detections are located southeast of the former Montgomery Ward auto service center and northwest of the Shell service station. Nickel concentrations greater than 100 µg/L appear to be associated with TPH and other organic contaminants. The presence of nickel in groundwater across the Site may be associated with its solubility in relation to high organic carbon concentrations and/or anaerobic conditions.

Shell Service Station

The Shell service station has been completely removed. Contamination of soil and groundwater was encountered and largely removed during the removal of associated underground piping, clarifiers and surface features. Based on split confirmation samples collected by Versar, residual concentrations of benzene and TPH exceeding prospective levels for protection of groundwater as a non-drinking water resource are documented in limited areas of the former Shell station. Additionally, an incompletely destroyed groundwater monitoring well was left at the Site for proper abandonment.

SECTION 7.0

STATEMENT OF LIMITATIONS

The data presented and the opinions expressed in this report are qualified as follows:

- The sole purpose of the investigation and of this report is to assess the physical characteristics of the Site with respect to the presence or absence of oil or hazardous materials and substances in the environment as defined in the applicable state and federal environmental laws and regulations and to gather information regarding current and past environmental conditions at the Site.

- Versar derived the data in this report primarily from visual inspections, examination of records in the public domain, and interviews with individuals with information about the Site. The passage of time, manifestation of latent conditions, or occurrence of future events may require further exploration at the Site, analysis of the data, and reevaluation of the findings, observations, conclusions, and recommendations expressed in the report.

- In preparing this report, Versar has relied upon and presumed accurate certain information (or the absence thereof) about the Site and adjacent properties provided by governmental officials and agencies, the Client, and others identified herein. Except as otherwise stated in the report, Versar has not attempted to verify the accuracy or completeness of such information.

- The data reported and the findings, observations, conclusions, and recommendations expressed in the report are limited by the Scope of Services. The Scope of Services was defined by the requests of the Client, and the availability of access to the Site.

- The findings, observations, conclusions, and recommendations expressed by Versar in this report are limited to the information obtained and should not be considered an opinion concerning the compliance of any past or current owner or operator of the Site with any federal, state, or local law or regulation. No warranty or guarantee, whether expressed or implied is made with respect to the data reported or findings, observations, conclusions, and recommendations expressed in this report. Further, such data, findings, observations, conclusions, and recommendations are based solely upon Site conditions in existence at the time of investigation.

- This report has been prepared on behalf of the Client, and is subject to and issued in connection with the Agreement and the provisions thereof.

SHELL SERVICE STATION REMOVAL MONITORING REPORT

January 20, 2015

Mr. Sean O'Shea
Underwriting Analyst
Essex Property Trust, Inc.
925 East Meadow Drive
Palo Alto, California 94303

Subject: Shell Service Station Removal Monitoring Report
Station Park Green
1790 S. Delaware Street
San Mateo, California
Versar Project No. 105071.0064.001

Dear Mr. O'Shea:

Enclosed please find Versar, Inc.'s report titled Shell Service Station Removal Monitoring Report, 1790 S. Delaware Street, San Mateo, California (Site). This report describes and documents activities and conditions observed during the demolition and removal of the Shell service station. From 5th to the 18th of December 2014 Versar, Inc. (Versar) observed demolition of the Shell service station and removal of all known appurtenances, above and below ground, including the removal of underground storage tanks (USTs), fuel dispenser catch basins and fuel piping. Bureau Veritas (an environmental consultant representing AU Energy, the company responsible for the Site improvements) directed Sparger Technologies (Sparger) to collect soil and water samples from areas that exhibited odor or staining; Versar collected split samples from Sparger. Excavation of impacted soil was guided by Bureau Veritas and informed by analytical data obtained by Sparger.

Versar's report comprises a daily log of observed activities and conditions, followed by a summary of the results of analytical laboratory testing of split samples. Attachments to this report comprise figures depicting the Site location, layout and sample locations, tabulated summaries of sample results, and the laboratory analytical reports.

ACTIVITIES

December 5, 2014 – Walton Engineering, the demolition contractor, removed and disposed of three gasoline USTs, four fuel dispenser catch basins and fuel distribution piping from the southern and central Site. A sweet odor was observed in the annular material surrounding the USTs; Walton Engineering believed that the odor is due to fiberglass resin. Groundwater was observed in the UST pit.

Much of the overburden from the UST area was stockpiled onsite; this material was subsequently used to fill excavated areas. The stockpiled material exhibited a slight petroleum odor and photoionization detector (PID) readings as high as 15 parts per million (ppm).

Potentially impacted soil was removed from the areas of the fuel dispensers and piping; excavation of these areas was guided by odor, staining, sheen or PID response. Odors and staining were strongest in the fuel dispenser island area. A layer of black, odor-bearing soil was encountered from three and one-half feet below grade surface (bgs) to five feet bgs in the UST pit, and from three feet bgs to six feet bgs in the piping trenches and fuel dispenser area.

Sparger Technologies and Versar collected soil samples beneath the fuel dispensers, beneath the fuel piping and from the north and south walls of the UST pit. A sample of the groundwater in the UST pit was collected.

December 9, 2014 – Walton Engineering removed the clarifier beneath the former carwash. Prior to removal, a sheen was visible on the water contained within the clarifier. PID readings as high as 1.5 ppm were observed in the interior of the clarifier.

As the carwash clarifier was being removed a strong rotten egg odor was observed. Soil adjacent to the clarifier exhibited staining and PID readings as high as 8.0 ppm. No sheen or petroleum odor was observed in the soil surrounding the clarifier.

December 10, 2014 – Versar located the casing of monitoring well S-4. The well casing was open and appeared to have not been grouted; the screened section of the well casing was visible. Versar informed Bureau Veritas, who informed San Mateo County personnel; it appears that Conestoga- Rovers (former Site consultant) is responsible for the disposition of the well.

Versar was not able to locate former monitoring wells S-5B or S-6, the former waste oil UST to the southwest of the service station building, or any remnants of those features.

Walton Engineering removed three hydraulic hoists and a clarifier from the former service station building. At the direction of Bureau Veritas, Sparger and Versar collected soil samples from beneath each hoist, beneath the hoist-associated clarifier and beneath the carwash clarifier.

December 15, 2014 – The water level in the UST pit was observed to be one foot bgs after several days of heavy rain. Walton Engineering attempted to dewater the UST pit; this was unsuccessful due to continued heavy rain and groundwater infiltration. Approximately 40,000 gallons of water were removed from the UST pit and hauled offsite by Ponder Environmental. After the attempted dewatering the water level in the UST pit was approximately two feet bgs.

December 16, 2014 – In response to analytical data obtained by Sparger showing petroleum and benzene impacts, Walton Engineering over-excavated the fuel dispenser area. The layer of stained soil surrounding the fuel dispensers became thinner as the distance from the dispensers increased; approximately ten feet from the dispensers the stained soil was encountered from four feet bgs to six feet bgs.

5330 Primrose Drive, Suite 147
Fair Oaks, CA 95628
916.962.1612
www.versar.com

Strong petroleum odors and staining were observed to the north of the dispenser area, in the area of the four former USTs.

The dispenser area was over-excavated to approximately seven feet bgs. The underlying soil comprised blue-gray clay with tan mottles and root hairs; no petroleum odor or staining was observed. Sparger and Versar collected samples from the floor of the excavation under the fuel dispenser area and to the north.

The central hydraulic hoist and the hoist-associated clarifier locations were over-excavated and soil samples were collected from beneath each feature.

PID readings as high as 30 ppm were observed during the excavation of the dispenser area.

December 17, 2014 –Walton Engineering continued over-excavation of the former UST pit north of the fuel dispenser area. This soil was live-loaded for offhaul; impacted soil was not stockpiled on site. Strong petroleum odors, greasy staining and PID hits as high as 45 ppm were observed in the former UST pit area.

Stained soil remained in place in the eastern sidewall of the fuel dispenser area excavation; this sidewall was braced with drain rock to prevent slumping. This sidewall was not excavated further because of the presence of underground utilities and the South Delaware Street sidewalk.

Sparger and Versar collected samples of the water in the UST pit.

December 18, 2014 – Walton Engineering continued over-excavation of the former UST pit area. The stained, odor-bearing soil layer stopped approximately 20 feet south of the northern boundary of the Site; soil to the north of this area comprised mixed blue and gray sand with no odor or staining and was believed to be fill. Over-excavation of the former UST pit was discontinued.

Walton Engineering over-excavated the piping trenches and the north sidewall of the UST pit until presumed native, unimpacted soil was observed; Sparger and Versar collected samples of this soil.

Walton Engineering completed over-excavation on December 18 and does not intend to excavate further.

SUMMARY OF SAMPLE RESULTS

Soil

Several soil samples collected during the initial characterization sampling event on December 5 exceeded EPA Region 9 Environmental Screening Levels (ESLs) and San Francisco Bay Regional Water Quality Control Board (SF RWQCB) ESLs for residential use, with concentrations of gas-range total petroleum hydrocarbons (TPH-g), naphthalene, benzene, xylenes, tertiary butanol (TBA) and methyl tertiary-butyl ether

(MTBE) as high as 430 milligrams per kilogram (mg/kg), 2.9 mg/kg, 3.0 mg/kg, 3.2 mg/kg, 0.19 mg/kg and 0.18 mg/kg, respectively.

Because the data obtained from the December 5 sampling event was used to guide the over-excavation, most of the soil characterized during the December 5 sampling event was subsequently excavated and removed from the Site: All piping trench, dispenser catch basin and north UST pit wall areas were over-excavated and removed. This includes all soil characterized by samples PT1-6' through PT12-6', UDC 1/2-6' through UDC 7/8-6' and T1N-7' through T3N-8'.

Samples collected from soil remaining in the south UST pit wall exhibited concentrations of benzene, TBA and MTBE as high as 0.11 mg/kg, 0.15 mg/kg and 0.18 mg/kg, respectively. This soil was not over-excavated due to proximity to the property line, sidewalk and street.

Soil samples collected from the area of the hydraulic hoists and hoist-associated clarifier exhibited benzene concentrations as high as 0.54 mg/kg. The central hoist and the hoist-associated clarifier areas were over-excavated; subsequent confirmation samples collected from these areas did not exceed regulatory screening levels for compounds of concern.

Versar's split sample "Hoist 3 – 9'", collected from beneath the northern hoist exceeded SF RWQCB ESLs for TPH-diesel, TPH-hydraulic fluid and TPH-motor oil, with concentrations of 2,400 mg/kg, 3,000 mg/kg and 2,500 mg/kg, respectively. This sample did not exhibit greater odor or staining than other samples collected in this area. No further over-excavation was performed at the northern hoist.

As over-excavation progressed, confirmation samples were collected from over-excavated areas, primarily the floor of the excavation. Several samples collected from the floor of the dispenser area and northern UST pit area exceeded the EPA Region 9 and SF RWQCB ESLs for benzene, with concentrations as high as 2.4 mg/kg. Several samples exceeded the SF RWQCB ESL for TBA, with concentrations as high as 0.37 mg/kg, and sample EX8-6.5' exceeded the SF RWQCB ESL for MTBE with a concentration of 0.071 mg/kg. The soil characterized by these confirmation samples was not over-excavated.

Groundwater

The initial water sample collected from the UST pit exceeded SF RWQCB ESLs for aquatic toxicity and drinking water Maximum Contaminant Levels (MCLs) for TPH-gas, TPH-diesel, benzene, toluene, ethylbenzene and xylenes, with concentrations of 24,000 micrograms per liter (ug/L), 1,300 ug/L, 810 ug/L, 8,300 ug/L, 1,300 ug/L and 7,900 ug/L, respectively; the sample also exceeded the ESL for naphthalene, with a concentration of 190 ug/L, and the drinking water MCL for MTBE, with a concentration of 22 ug/L. A subsequent water sample was collected after dewatering approximately 40,000 gallons from the tank pit, a substantial portion of which was due to precipitation. The second water sample exceeded the SF RWQCB drinking water MCL for benzene, with a

5330 Primrose Drive, Suite 147
Fair Oaks, CA 95628
916.962.1612
www.versar.com

concentration of 3.8 ug/L; all other compounds of concern were below their respective screening levels.

CONCLUSION

The Shell service station has been completely removed. Contamination of soil and groundwater was encountered and largely removed during the removal of associated underground piping, clarifiers and surface features. Based on split confirmation samples collected by Versar, residual concentrations of benzene and TPH exceeding prospective action levels for protection of groundwater as a non-drinking water resource are documented in limited areas of the former Shell station. Additionally, an incompletely destroyed groundwater monitoring well was left at the Site for proper abandonment.

Versar appreciates the opportunity to support Essex Property Trust on this project. Please contact me at (916) 863-9323 should you have any questions or comments regarding this report.

Sincerely,

Tim Berger, PG
Operations Manager
Environmental Services Group

Notes and Abbreviations:
Values in bold meet or exceed screening level

[1] Reporting Limit varies by analyte.

LOC = Location of Concern
< = Less than the method reporting limit
ESL = Environmental screening level
mg/kg = milligram per kilogram
NA = Not analyzed
No Std = No Standard
TTLC = Total Threshold Limit Concentration
PRG = Preliminary Remediation Goals
VOCs = Volatile Organic Compounds
TBA = Tertiary Butanol
MTBE = Methyl Tertiary-Butyl Ether
ETBE = Ethyl Tertiary-Butyl Ether
DIPE = Di-Isopropyl Ether
TAME = Tertiary-Amyl Methyl Ether
p-IT = p-Isopropyltoluene
1,3,5-TMB = 1,3,5-Trimethylbenzene
t-BB = Tertiary Butylbenzene

ND = Not Detected Above Laboratory Reporting Limit
RWQCB = Regional Water Quality Control Board
TPH = Total Petroleum Hydrocarbons
TPH-g = Gasoline Range TPH
TPH-d = Diesel Range TPH
TPH-hf = Hydraulic Fluid Range TPH
TPH-mo = Motor Oil Range TPH
PCBs = Polychlorinated Biphenyls
SVOCs = Semivolatile Organic Compounds
1,2-DCA = 1,2-Dichloroethane
1,2-DBA = 1,2-Dibromoethane (Ethylene dibromide)
n-BB = n-Butylbenzene
sec-BB = sec-Butylbenzene
IB = Isopropylbenzene
n-PB = n-Propylbenzene
1,2,4-TMB = 1,2,4-Trimethylbenzene

Subject: Request for analysis change for Versar, Inc. samples shipped on 12/18/14

Dan, Lori,

I dropped some samples off yesterday at your West Sacramento office for a project called "Station Park Green Shell Station Removal". I need to change the requested analyses as follows:

For samples that begin with "EX" or "Tank Pit", please change the analysis to 8015 carbon chain (full range TPH), 8260 BTEX, oxygenates (5-oxy), lead scavengers and naphthalene. We do not need 8260 full list or 8082 PCBs for these samples.

For the samples starting with "Clarifier" or "Hoist", please run the analyses listed on the COC.

Thank you for your time; sorry about the error.

HEALTH & SAFETY PLAN DOCUMENTATION

8.0 DOCUMENTATION

8.1 Site Safety Plan Agreement

In the situation that contamination is encountered which could come into contact with site development personnel, all details of this site safety plan will be implemented. Versar personnel have the authority to stop work performed by our subcontractors at this site if any work is not performed in accordance with the requirements of this site safety plan.

All Versar project personnel and subcontractor personnel are required to sign the following agreement prior to conducting work at the site.

A. I have read and fully understand the site safety plan and my individual responsibilities.

B. I agree to abide by the provisions of the site safety plan.

Fair Oaks CA, 95628	Project Manager: Dave Sendek	12/10/14 17:00

Notes and Definitions

R-07	Reporting limit for this compound(s) has been raised to account for dilution necessary due to high levels of interfering compound(s) and/or matrix affect.
QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to possible matrix interference. The LCS was within acceptance criteria. The data is acceptable as no negative impact on data is expected.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

Subject: Supplemental Phase II Environmental Site Assessment
Station Park Green
1700, 1750 and 1790 S. Delaware Street
San Mateo, California
Versar Project No. 105071.0053.002

Dear Mr. O'Shea:

Enclosed please find Versar, Inc.'s report titled Supplemental Phase II Environmental Site Assessment, Station Park Green, 1700, 1750 and 1790 S. Delaware Street, San Mateo, California (Site). This investigation has further assessed potential environmental liabilities initially identified in Versar's Phase I Environmental Site Assessment (ESA), dated December 13, 2013, and further investigated in Versar's Phase II ESA dated April 24, 2014. In the Phase I ESA, Versar identified the reasonable potential for environmental liabilities associated with the current and historical auto repair and gasoline dispensing operations at the current Shell station and former Montgomery Ward auto center (now a Michael's Arts and Crafts), as well as with a variety of historical industrial uses in the western portion of the Site. Off-Site impacts in groundwater from the western, up-gradient properties also appeared likely.

In the initial Phase II ESA Versar identified actionable concentrations in groundwater of benzene; Total Petroleum Hydrocarbons (TPH) in the gasoline, diesel and motor oil ranges; nickel, lead and cadmium; and the Volatile Organic Compounds (VOCs) 1,2-Dichloroethane (1,2-DCA) and Methylene Chloride. Actionable concentrations in soil were identified for TPH and lead. In soil vapor, the benzene concentration at the north side of the Shell station was elevated. A low concentration of polychlorinated biphenyls (PCBs) in soil was also identified behind the Michael's building. Direct assessment of the Shell station was not a part of the Phase II investigation.

In the attached Supplemental Phase II ESA, Versar further delineated the potential extent of soil and groundwater contamination identified in the Phase II ESA, and installed one boring in the former Montgomery Ward auto center to determine if a hydraulic fluid release to groundwater has occurred. The results of the investigation identified approximately 1,100 cubic yards of shallow soil south of the former Montgomery Ward auto center contaminated with actionable concentrations of TPH, and approximately 7,500 cubic yards of shallow soil in the southwestern portion of the site with actionable concentrations of TPH. Direct assessment of the Shell station was not a part of the supplemental Phase II investigation.

Perched groundwater contamination previously identified in one boring in the southwestern portion of the site during the initial Phase II investigation was determined not to be laterally extensive, and limited to the area of the initial sample. Actionable concentrations of nickel were identified at eight locations throughout the Site and appear to potentially be associated with high organic carbon concentrations or anaerobic conditions and a background condition, though one concentration adjacent to the Michaels building is significantly elevated. The groundwater sample collected beneath the former Montgomery Ward Auto center did not identify PCBs.

Versar appreciates the opportunity to support Essex Property Trust on this project. Please contact me at (916) 863-9323 should you have any questions or comments regarding this report.

Sincerely,

Tim Berger, P.G.

SECTION 1.0

EXECUTIVE SUMMARY

Versar, Inc. (Versar) has performed a Supplemental Phase II Environmental Site Assessment (ESA) of the Station Park Green property located at 1700, 1750 and 1790 S. Delaware Street, in San Mateo, San Mateo County, California (Site). This report has been prepared to conform with the scope and limitations of the American Society for Testing and Materials Standard Practice E1903-97, *Standard Guide for Environmental Site Assessments: Phase II Environmental Site Assessment Process*.

The Phase II investigation and this Supplemental Phase II Investigation have been performed to assess the extent of contamination of Site soil and groundwater associated with issues of concern identified in a Phase I ESA conducted of the Site by Versar in December 2013. Issues of environmental concern that were identified in the Phase I ESA are summarized below:

- LOC #1 – Shell's Historical Auto Repair Operations and Gasoline Dispensing. Residual total petroleum hydrocarbons (TPH) in groundwater from the removal of the underground storage tanks (USTs) and hydraulic hoists at the Shell station include benzene at 45 micrograms per liter (µg/L), which exceeds the Environmental Screening Level (ESL) for residential use of 27 µg/L. Groundwater impacts from the hydraulic lift location included up to 2,200 µg/L of TPH-gasoline (TPH-g) at the time of case closure. Although both release cases from the Shell station are closed, the residual groundwater impacts above the action level represent a potential vapor encroachment condition (pVEC) and Recognized Environmental Condition (REC) to the Site. Also, a clarifier was associated with the Shell station car wash but had not been assessed to date, representing an REC

  In December 2014, the Shell Service Station was demolished and all buildings and appurtenances removed. During the Shell station removal, performed on behalf of Shell by others, petroleum-impacted soil and groundwater were encountered, removed and disposed off Site.

.

- LOC #2 – Incomplete Closure for Waste Oil Tank at Shell. In March 1987, a 550-gallon waste oil UST was removed from the south side of the Shell service station and a double-walled waste oil UST was reported to be installed adjacent to the removed waste oil UST. Samples were collected during the 1987 waste oil UST removal; however, no regulatory close out documentation was identified from the files Versar reviewed. According to the AECOM 2011 Phase I ESA, a double-walled waste oil tank that was installed in 1987 was reportedly removed from the Shell service station in 2006. The absence of close out documentation from the waste oil UST removals (1987 and 2006) present a REC to the Site.

- LOC #3 – Former Montgomery Ward Auto Service Center. At the former Montgomery Ward auto service center (now occupied by Michaels), the waste oil tank on the east side of the former auto center has been closed by the County, but was not assessed for solvents such as chlorinated volatile organic compounds (CVOCs), which are likely to be contained within a waste oil tank since waste oil tanks from automotive operations

comprise a variety of materials, including VOCs. Hydraulic lifts were likely present in the Montgomery Ward auto service center in the 1970s. No record of the removal of the lifts or any of the auto service center materials has been identified. A release of hydraulic fluid from the lifts is reasonably likely, and could contain polychlorinated biphenyls (PCBs). An oil/water separator on the south side of the Michaels building has not been assessed and could present environmental liabilities based on the former auto service center usage at this location. The incomplete UST closure and the absence of facility closure data regarding the former hydraulic lifts and oil/water separator represent an REC and pVEC to the Site.

- LOC #4 – Kmart Elevator. A piston-style hydraulic elevator services the two floors of the Kmart building and was installed in the early 1970s. A release of hydraulic fluid from the piston casing is reasonably likely, and could contain PCBs. No evidence of a release was identified in three grab-groundwater samples collected outside the building in the perceived down-gradient direction from the elevator.

- LOC #5 – On and Off-Site Sand/Gravel/Asphalt Operations with Oil Tanks. The historical use of the strip of land that adjoins the Site to the west (east of the Caltrans rail) included sand and gravel operations, an asphalt plant and a truck repair building. Sanborn maps depict multiple oil tanks and other features of concern, a few of which were located on the Site, with the rest adjoining the Site in an up-gradient direction. City of San Mateo Fire Department records indicated that three underground fuel storage tanks were installed at the asphalt plant in 1961. The plant facilities (including four additional above-ground tanks for fuel oil and asphalt) were demolished in 1973 by Concar Enterprises. No information was identified that indicates whether or not the tanks were removed from the site. These potential sources of petroleum impact to groundwater are adjacent and directly upgradient from the Site.

- LOC #6 – Off-Site Caltrain Corridor. The Caltrain Corridor (SF to Santa Clara) adjoins portions of the west end of the Site and is reported to contain TPH and metals in soil. TPH in groundwater is likely to occur within the corridor. The Caltrain corridor is within the ASTM Critical Distance of the Site. Based on the corridor location within the Critical Distance of the Site with similar impacts that have been identified at the Site, the Caltrain corridor presents an off-Site REC and pVEC to the Site.

- LOC #7 – Off-Site Vail Burner & Oil Company. Contamination of groundwater by the Vail Burner & Oil Company west of the adjoining Caltrain corridor is documented and has not been defined to the east, toward the Site. Two monitoring wells closest to the Site are impacted by TPH-diesel and CVOCs. The TPH-d and CVOC impacts from this facility have not been defined to the east (toward the Site) and as such, this facility represents an off-Site REC and pVEC to the Site.

SECTION 2.0

BACKGROUND INFORMATION

Versar, Inc. (Versar) has performed a Supplemental Phase II Environmental Site Assessment (ESA) of the Station Park Green property located in San Mateo, Santa Mateo County, California (Site). The Site location is shown in Figure 1, Site Location Map. The purpose of the Supplemental Phase II ESA is to further investigate locations of concern (LOCs) related to Site operations identified in Versar's Phase I ESA dated December 13, 2013 and Versar's initial Phase II ESA dated April 21, 2014.

The scope of work for this project included collecting soil and groundwater samples from ten soil and nine groundwater borings to assess whether and to what extent contaminants exist at the Site at actionable concentrations. LOCs addressed through the Phase II ESA and Supplemental Phase II ESA include historical auto repair, gasoline dispensing operations and apparently incomplete closure of a waste oil tank at the Shell Service Station; assessing a closed waste oil tank at the east side of the former Montgomery Ward auto service center (now occupied by Michaels Arts & Crafts) for chlorinated Volatile Organic Compounds (VOCs), as well as an assessment of hydraulic lifts and an clarifier at this former auto service center; assessment of piston-style hydraulic elevators at the Kmart building; and assessing subsurface conditions at the west end of the Site from historical on and off-Site sand/gravel/asphalt operations with oil tanks; and off-Site releases of Total Petroleum Hydrocarbons (TPH) from the west adjoining Caltrain Corridor and Vail Burner & Oil Company areas.

The boring and LOC locations are depicted on Figure 2, Investigation Layout Map.

2.1 Background

The Site is located at 1700, 1750 & 1790 South Delaware Street, San Mateo, San Mateo County, California and developed with a Shell gas station, Michaels and Kmart retail stores and Gazillion Entertainment, an online video game developer. The Site is located in a mixed-use area of San Mateo and is bounded by Concar Street to the southeast, South Delaware Street to the northeast, AAA auto club and the United States Post Office to the north to northwest, and the Hayward Park Caltrain station to the west to southwest. The Site consists of two parcels, assessor's parcel numbers (APNs) 035-200-180 and 035-200-060, totaling approximately 11.4 acres and 0.5-acre, respectively.

2.2 Site Physical Setting

The Site is located in the Santa Clara Valley, which is a structural low associated with the southern end of the San Francisco Bay. Topography of the Site and surrounding area is characterized by relatively flat terrain with a gentle slope eastward to San Francisco bay. According to the United States Geological Survey (USGS) 7.5-minute series topographic map of the San Mateo, California Quadrangle, 1999, the Site is approximately eight feet above mean sea level (msl). The Site soil profile comprises 1.3 to 8.5 feet of fill overlying former estuarine marshland. Fill material is highly variable, comprising from gravel, sand and clay, typically with clay. Underlying marsh deposits comprise one to six feet of Bay Mud with organics. Underlying alluvium comprises proximal and distal fan deposits of anastomosing gravel, sand, silt and clay. The depth to groundwater varies across the Site, with elevation and encountered alluvium. In

environmental borings first encounter has ranged from 15 to 23 feet below present grade surface (bgs), stabilizing at 16 to 18 feet bgs. In geotechnical borings groundwater has been encountered from 6.4 – 9.2 feet bgs.

2.3 Purpose

The purpose of the Phase II ESA and Supplemental Phase II ESA is to investigate whether, and to what extent, current and historical operations related to various auto repair, gasoline dispensing and storage and handling of hazardous materials at the Site have impacted soil, soil vapor and groundwater.

2.4 Scope of Work

In response to the recognized environmental conditions (RECs) identified in Versar's December 2013 Phase I ESA, and in conformance with a work plan submitted to the San Mateo County Environmental Health Division (SMCEHD); Versar conducted an initial soil, soil vapor and groundwater investigation of the Site, described in a Phase II Investigation report dated April 21, 2014. The findings of the Phase II Investigation report identified soil and groundwater contamination and a supplemental investigation was performed to delineate the contamination. Prior to initiating the field work, the following limitation was provided by the current owner of the Site, ARJAX II Railroad of San Mateo, California, c/o EBL&S Property Management, Inc. of Philadelphia, Pennsylvania:

- No borings were to be allowed within the Shell service station grounds.

PeneCore Drilling of Woodland, California provided drilling services from November 3 - 4, 2014. One additional boring located inside the former Montgomery Ward automotive service center was drilled by Enprobe of Oroville, California on November 18, 2014. All borings were hand augered to five feet bgs for safety purposes.

The tasks completed are listed below. Boring locations are depicted in Figures 2 through 4.

2.4.1 Soil, Soil Vapor and Groundwater Investigation

LOCs #1 and 2 – Shell's Historical Auto Repair Operations and Gasoline Dispensing

Using direct push technology (DPT), Versar assessed the features of interest of LOC #1 by advancing one boring (B18) in the former waste oil tank area. One grab-groundwater sample was collected to assess the northern extent of actionable 1,2-dichloroethane (1.2-DCA), fuel hydrocarbons and nickel.

The groundwater sample was analyzed for VOCs by EPA Method 8260B, nickel by EPA Method 6020 and TPH in the diesel (-d), motor oil (-mo) and gasoline (-g) ranges by EPA Method 8015M.

LOC #3 – Former Montgomery Ward Auto Service Center/Michaels

Versar installed five (5) borings in the LOC 3 area. One boring (B21) is within the building, ostensibly between the two former hydraulic lift pistons. Two soil samples and one grab-groundwater sample were collected to assess if a leak of hydraulic fluid has occurred from

5330 Primrose Drive, Suite 147
Fair Oaks, CA 95628
916.962.1612
www.versar.com

piston seal and casing failure. Hydraulic fluid can contain PCBs, which were identified by Versar in a previous soil sample behind the current Michaels building.

The southern two borings (B22 and B23) are step-outs from an apparent release from the clarifier south of the Michaels building, also associated with the former Montgomery Ward auto service center operation. TPH was previously identified in soil less than 5 feet deep at the west end of the clarifier. A soil sample was collected from the western location (B23) and analyzed for TPH – full range, VOCs, nickel and lead. Grab-groundwater samples were collected from each boring and tested for TPH, VOCs and nickel; the sample from boring B23 was also analyzed for lead.

The northern two borings (B19 and B20) relate to a former waste oil UST. Soil and groundwater samples were collected from the boring located just outside the northwest corner of the Shell station (B19) and analyzed for VOCs, TPH, lead and nickel to assess the southern extent of contamination previously identified just north of the Shell station. The grab groundwater sample from Boring B20 was collected specifically to assess the lateral extent of methylene chloride, lead and nickel identified in groundwater by Versar's March 2014 Phase II ESA.

Versar collected a total of three soil samples and five grab groundwater samples from the five borings at LOC #3.

LOC's #5 and 6 – On and Off-Site Sand/Gravel/Asphalt Operations with Oil Tanks and Caltrain Corridor

LOC 5 is potentially impacted by historical use by Concar Enterprises and the Caltrain Rail Corridor. During the initial Phase II ESA, very high concentrations of TPH and indications of free product were encountered at a depth of four feet in shallow, perched groundwater in the southwest portion of this LOC. Versar collected grab-groundwater samples from three step-out borings (B31, B32 and B33) to assess the lateral extent of the impacted, perched groundwater. The grab groundwater samples were analyzed for Full Range TPH.

To the north and northwest in LOC 5, elevated concentrations of TPH in the gasoline through oil ranges were detected in shallow soil between the surface and a depth of five (5) feet. To assess the lateral extent of this impacted area and further characterize the TPH concentrations over this large area, Versar collected shallow soil samples from seven soil borings (B24 through B30).

Boring logs were prepared for all borings and are presented in Appendix A.

2.4.2 Shell Service Station Removal Monitoring

From December 5 through 18, 2014 Versar observed the demolition of the Shell service station and removal of all known appurtenances, above and below ground, including the removal of USTs, fuel dispenser catch basins and fuel piping, and petroleum-impacted soil and groundwater. Versar collected split samples of soil and water from the station removal environmental consultant during the abandonment. A report documenting Versar's observation and split sampling results is included in Appendix B.

SECTION 3.0

FIELD INVESTIGATION

3.1 Permitting

A boring permit was obtained from the SMCEHD. A copy of the permit is provided in Appendix C.

3.2 Utility Clearance

Utility clearance for the Site comprised marking the investigation area, notifying Underground Service Alert (USA) (Ticket #0093795), and performing private utility searches on November 3 and November 18, 2014. Underground utilities within public rights of way were identified and marked by USA. Specific boring locations within the property were cleared by a private utility locator. Borings B25, B27, B28 and B29 had to be relocated approximately 10 feet west of the original location due to the presence of an underground water line. No utilities were encountered during the investigation.

3.3 Project Health and Safety

Versar prepared a Site-specific health and safety plan (HSP) prior to performing the field investigation. A Site Safety Officer (SSO) was designated during the field investigation. The SSO was responsible for adherence to the HSP and was present during all field activities. The HSP was presented, reviewed and signed by field personnel. The HSP field documentation is provided in Appendix D.

3.4 Decontamination Procedures

Down-hole equipment including drilling rods, bits and sampling equipment was thoroughly cleaned before and after the drilling of each borehole. Equipment was cleaned with water and laboratory-grade, non-phosphate surfactant, and double rinsed, or high-pressure washed. Wastewater generated during this process was stored on Site in appropriate containers pending disposal. Clean, disposable gloves were worn by all field personnel when handling decontaminated equipment.

3.5 Field Screening

Soil samples were field screened using a Photo-Ionization Detector (PID). The PID was calibrated before use in the field. The calibration was performed using a reference gas of 100 parts per million (ppm) isobutylene, which is the standard for fuel hydrocarbon screening. The PID utilized a 10.6 eV lamp which provides the most direct reading of fuel hydrocarbons and related aromatics.

The results of PID field screening, as well as visual indicators of contamination such as staining, sheen, and product presence as encountered, were used in selecting soil samples for laboratory analysis, and documented on the boring logs presented in Appendix A.

5330 Primrose Drive, Suite 147
Fair Oaks, CA 95628
916.962.1612
www.versar.com

3.6 Field Activities

Field activities were performed during November 3-4 to November 18, 2014 and comprised 16 borings within the boundaries of the Site; and collecting soil and groundwater samples for laboratory analysis. Table 1 in Section 4.0 summarizes the sample locations and analytical tests for each location.

3.6.1 Soil Borings

Most of the soil borings were advanced by first using the drill rig to bore asphalt paving. Inside the Michaels building, the concrete floor was cored for Boring B21. All soil borings for soil and groundwater sampling were initially advanced to five feet by hand auger to avoid damage to unknown utilities. The remainder of each boring was advanced with a direct-push drill rig. Borings B19, B21 and B23 were advanced from five feet bgs to approximately 25 feet bgs with a direct push drill rig using dual-tube tooling (to allow collection of soil samples); a temporary well casing was installed in each boring, and a grab groundwater sample was collected. In addition to the grab groundwater samples, one soil sample per boring was collected from borings B19, B21 and B23.

For borings B-18, B20, B22, B31, B32 and B33 a Hydropunch device was advanced to 25 feet bgs with a direct-push drill rig and a grab-groundwater sample collected. Hydropunch tooling was used to avoid contamination of the sample with perched water previously encountered at four feet bgs.

The locations of soil samples are shown on Figures 2 through 4. Borings were extended to depths ranging between 10 and 28 feet bgs. A drilling log was created for each boring describing the soil profile, sample collection locations, field observations and PID readings. The boring logs are presented in Appendix A.

Each soil boring was abandoned per permit requirement by filling with neat cement containing up to five percent powdered bentonite. Borings in which groundwater was encountered were filled using a Tremie pipe. Borings were filled to the surface, allowed to settle and topped off. Soil cuttings and decontamination water were contained in one 55-gallon Department of Transportation (DOT)-approved drum for later disposal. The drum was labeled as non-hazardous waste with appropriate information including the contents and date of collection. The waste-containing drum was stored in a secure location on Site until removal and disposal based on its waste characteristics.

3.6.2 Soil Sampling

A total of 30 soil samples were collected from borings B19, B21, and B23 through B30. Soil samples were collected at predetermined depths, or when field observation of odor, unusual soil color or staining indicated potential contamination. All soil samples were screened using a photoionization detector prior to collection.

Samples collected by hand-augering were retained in stainless steel sleeves, with exposed sleeve ends covered with Teflon sheeting and each end capped with a pressure-fitted plastic cap. Samples collected by direct push were retained within the acetate liner of the direct push sample barrel. Samples cut from the liner were sealed, with exposed liner ends covered with Teflon sheeting and each end capped with a pressure-fitted rubber cap. The samples were separately contained in new, re-sealable plastic bags placed on ice in a cooler prior to

transferring custody to the contract laboratory. All samples were handled following chain-of-custody protocols, from collection through analysis.

3.6.3 Groundwater Sampling

Grab-groundwater samples were collected from boring B18 through B23 and borings B31 through B33. In borings B19, B21 and B23 a 0.020-slotted polyvinyl chloride (PVC) pipe was inserted into the boring to allow continued access to the water-bearing unit. Well screens were set at 25 feet bgs in boring B19 and B23, and at 28 feet bgs in boring B21. Grab groundwater samples were collected from borings B18, B20, B22, B31, B32 and B33 by driving a Hydropunch sampler to the target depth, and retracting the rods to expose the screen. Grab-groundwater samples were collected at each location by gently lowering a pre-cleaned, polyethylene bailer into the groundwater, recovering the water-filled bailer and carefully decanting the sample into the appropriate sample container, with preservative as appropriate. Metals samples were not preserved in the field, and were laboratory-filtered before analysis.

3.7 Storage and Disposal of Wastes

Wastes collected during the investigation comprised soil cuttings. All collected wastes were placed into a 55-gallon, DOT-approved drum and stored at the Site pending disposal. The wastes collected and stored at the Site comprised one drum of soil. The contents of the drum and the date of collection were clearly marked on an appropriate label.

SECTION 4.0

LABORATORY ANALYSIS

Selected soil and groundwater samples were submitted to a California state-certified laboratory for chemical analyses: SunStar Laboratories, Inc. (SunStar), (Environmental Laboratory Accreditation Program [ELAP] Certificate No. 2250). Samples were analyzed within instrument and accuracy limits defined by the method. The samples were collected, placed in containers, preserved and analyzed within the time constraints consistent with applicable USEPA, California EPA, and industry practices. Samples were delivered under Versar's chain-of-custody protocol; custody of the samples began at the time of sample collection and was maintained by the sampling team until the samples were relinquished to the laboratory. The samples were analyzed as follows:

TABLE 1:
LABORATORY ANALYSIS FOR EACH SAMPLE LOCATION

Sample	Matrix	Analyses
B-18	Water	VOCs, Nickel, TPH-g, d, mo
B-19	Water	VOCs, Nickel, Lead, TPH-g, d, mo

Analyses were conducted by EPA Method 8260B for VOCs, EPA Method 8015C for full-range TPH analyses (TPH-g, -d, -hf, -mo), EPA Method 6010B for metals and EPA Method 8082 for PCBs. The results of analytical testing are summarized in Tables 2 through 4. The laboratory reports and chain-of-custody documentation are presented in Appendix E.

SECTION 5.0

INVESTIGATIVE FINDINGS

The findings of the Supplemental Phase II ESA are presented in the following sections. Tabulated analytical results are presented in Tables 2 and 3. The laboratory analytical report and chain-of-custody documentation are included in Appendix E. Regulatory screening criteria used were the San Francisco Regional Water Quality Control Board Environmental Screening Levels (SF RWQCB ESLs – Residential, December 2013), California Human Health Screening Levels (CHHSLs – 2010) and U.S. EPA Region 9 RSLs (November, 2013). Sample results were compared to residential cleanup criteria.

5.1 Soil Samples

TPH Analysis

Gasoline-range hydrocarbons (TPH-g) were detected in soil samples collected from borings B19, B26 and B30. The highest concentration, 340 milligrams per kilogram (mg/kg), was detected in the sample collected from boring B30 (Sand/Gravel/Asphalt Plant) at nine feet bgs. This concentration exceeds the SFRWQCB ESL for TPH-g of 100 mg/kg. Soil samples collected at depths of 3.5 feet, 12 feet and 15 feet bgs did not contain gasoline range hydrocarbon concentrations above the reporting limit of 10 mg/kg.

Two soil samples collected from boring B26 at depths of 8 and13 feet bgs contained TPH-g at concentrations of 79 mg/kg and 110 mg/kg, respectively. A third sample collected from boring B26 at a depth of 15 feet bgs did not contain gasoline range hydrocarbon concentrations above the reporting limit of 10 mg/kg. The concentration in the 8-foot sample exceeds the SFRWQCB ESL for TPH-g of 100 mg/kg.

One soil sample collected from boring B19 (outside the northwest corner of the Shell station) contained TPH-g (12 mg/kg) but did not exceed the SFRWQCB ESL. Soil samples collected at depths of 5 feet and 11 feet bgs did not contain gasoline range hydrocarbon concentrations above the reporting limit of 10 mg/kg.

Diesel-range hydrocarbons (TPH-d) were detected in 10 samples at concentrations ranging from 12 mg/kg to 170 mg/kg. The SFRWQCB ESL for TPH-d of 100 mg/kg was exceeded at two locations. The exceedances were at the former Sand/Gravel/Asphalt Plant borings B28 and B30. Boring B28 had a concentration of 170 mg/kg at a depth of 3.5 feet bgs. A second sample from B28 contained a concentration of 23 mg/kg at a depth of 8 feet bgs. A third sample from B28 did not contain diesel range hydrocarbon concentrations above the reporting limit of 10 mg/kg.

Boring B30 had a TPH-d concentration of 4,100 mg/kg at a depth of 9 feet bgs and a concentration of 3,700 mg/kg at the 12 foot bgs depth. TPH-d at the B30 sample locations of 3.5 and 15 feet bgs did not contain diesel range hydrocarbon concentrations above the reporting limit of 10 mg/kg.

Concentrations of TPH-d below the SFRWQCB ESL were detected in samples collected from borings B19, B24, B25, B26, B27 and B29, with concentrations ranging from 12 to 93 mg/kg.

5330 Primrose Drive, Suite 147
Fair Oaks, CA 95628
916.962.1612
www.versar.com

The highest concentrations of TPH-d were generally detected in the upper five feet of soils in the former Sand/Gravel/Asphalt Plant area.

Motor oil-range hydrocarbons (TPH-mo) were detected in 10 soil samples at concentrations ranging from 12 to 30,000 mg/kg. The SFRWQCB ESL for TPH-mo of 100 mg/kg (Residential) was exceeded in nine locations. The highest concentrations of TPH-mo were detected in samples from boring B30 (Sand/Gravel/Asphalt Plant) at 9 feet and 12 feet bgs. Concentrations of 30,000 mg/kg and 22,000 mg/kg were detected at 9 feet and 12 feet bgs, respectively. A sample collected from 15 feet bgs in boring B30 did not contain TPH-mo concentrations above the reporting limit of 10 mg/kg.

A TPH-mo concentration 680 mg/kg was detected in boring B28 (Sand/Gravel/Asphalt Plant) at a depth of 3.5 feet bgs. Deeper samples collected from boring B28 at depths of 8 feet (84 mg/kg) and 15 feet bgs (not detected above the reporting limit of 10 mg/kg) did not exceed the ESL. Samples from boring B29 collected at 2.5 feet, 5 feet and 7 feet bgs contained concentrations of 310 mg/kg, 170 mg/kg and 58 mg/kg, respectively. A fourth sample collected from boring B29 did not detect TPH-mo above the reporting limit of 10 mg/kg. Samples collected from boring B25 at 2.5 feet bgs, B27 at 2.5 feet bgs, B24 at 5 feet bgs, and B26 at 2.5 feet bgs detected TPH-mo concentrations of 260 mg/kg, 200 mg/kg, 140 mg/kg and 100 mg/kg, respectively.

Concentrations of TPH-mo below the SFRWQCB ESL were also detected in shallow soil samples collected from boring B19 at 5 feet bgs (outside the northwest corner of the Shell station) and boring B24 at 2.5 feet bgs (Sand/Gravel/Asphalt Plant), with concentrations of 50 and 49 mg/kg, respectively.

VOC Analysis

No VOCs were detected at or above laboratory reporting limits in soil samples collected from borings B19 or B23.

PCB Analysis

No PCBs were detected at or above laboratory reporting limits in two soil samples collected from boring B21, located beneath the former Montgomery Ward Auto Service Center.

Metals Analysis

Concentrations of lead below screening levels were detected in two soil samples collected from boring B19 (B-19-5 and B-19-8). The detected lead concentrations ranged from 6.6 mg/kg to 8.9 mg/kg. One sample from boring B19 (B-19-11) and two samples from boring B23 (B-23-8 and B-23-12) did not contain lead concentrations above the reporting limit of 3.0 mg/kg.

Concentrations of nickel below screening levels were detected in three soil samples collected from boring B19 (B-19-5, B-19-8 and B-19-11) and two soil samples collected from boring B23 (B-23-8 and B-23-12). Nickel concentrations ranged from 18 mg/kg to 64 mg/kg.

The analytical results for TPH, VOCs, PCBs, nickel and lead were compared to the SFRWQCB ESLs and are presented in Table 2 of this report. No concentrations of VOCs, PCBs and metals in soil exceeded regulatory screening levels. Figure 3 illustrates the detected concentrations of analytes in soil samples that exceed applicable screening levels.

Fair Oaks, CA 95628
916.962.1612
www.versar.com

5.2 Groundwater Samples

TPH Analysis

Concentrations of TPH were identified in one groundwater sample collected from boring B19, north of the Shell Station, and collected from boring B33, near the former Sand/Gravel/ Asphalt Plant. The B19 location comprised a TPH-g concentration of 1,100 micrograms per liter (µg/L) and a TPH-d concentration of 540 µg/L. The B33 location comprised a TPH-d concentration of 670 µg/L. Each of the concentrations exceeded the SFRWQCB ESL of 100 µg/L for the respective TPH ranges.

No other concentrations of TPH exceeding applicable ESLs were identified in groundwater samples.

VOC Analysis

Concentrations of VOCs exceeding ESLs were not identified in groundwater samples.

Concentrations of VOCs below action levels included methylene chloride (4.3 µg/L) and chloroform (11 µg/L) at the boring B20 location (near the northwest corner of the Shell station). At the boring B22 location (former Montgomery Ward Auto Service Center), methylene chloride (2.7 µg/L) and chloroform (10 µg/L) were detected. At the boring B23 location in this area bromochloromethane (3.7 µg/L), bromodichloromethane (11 µg/L), chloroform (88 µg/L), chloromethane (1.4 µg/L), dibromochloromethane (2.4 µg/L), dibromomethane (2.9 µg/L) and methylene chloride (54 µg/L) were identified.

PCB Analysis

No PCBs were detected at or above laboratory reporting limits in the groundwater sample collected from boring B21, in the projected area of the former Montgomery Ward hydraulic lifts.

Metals Analysis

An actionable concentration of nickel was identified in the sample collected from boring B23. Nickel exceeded the California drinking water goal of 100 µg/L, at a concentration of 2,300 µg/L. Lead was not identified in the collected groundwater samples.

5.3 Shell Service Station Removal

Soil

Several soil samples collected during the initial characterization sampling event on December 5 exceeded EPA Region 9 Environmental Screening Levels (ESLs) and San Francisco Bay Regional Water Quality Control Board (SF RWQCB) ESLs for residential use, with concentrations of gas-range total petroleum hydrocarbons (TPH-g), naphthalene, benzene, xylenes, tertiary butanol (TBA) and methyl tertiary-butyl ether (MTBE) as high as 430 milligrams per kilogram (mg/kg), 2.9 mg/kg, 3.0 mg/kg, 3.2 mg/kg, 0.19 mg/kg and 0.18 mg/kg, respectively.

Because the data obtained from the December 5 sampling event was used to guide the over-excavation, most of the soil characterized during the December 5 sampling event was

subsequently excavated and removed from the Site: All piping trench, dispenser catch basin and north UST pit wall areas were over-excavated and removed. This includes all soil characterized by samples PT1-6' through PT12-6', UDC 1/2-6' through UDC 7/8-6' and T1N-7' through T3N-8'.

Samples collected from soil remaining in the south UST pit wall exhibited concentrations of benzene, TBA and MTBE as high as 0.11 mg/kg, 0.15 mg/kg and 0.18 mg/kg, respectively. This soil was not over-excavated due to proximity to the property line, sidewalk and street.

Soil samples collected from the area of the hydraulic hoists and hoist-associated clarifier exhibited benzene concentrations as high as 0.54 mg/kg. The central hoist and the hoist-associated clarifier areas were over-excavated; subsequent confirmation samples collected from these areas did not exceed regulatory screening levels for compounds of concern.

Versar's split sample "Hoist 3 – 9'", collected from beneath the northern hoist exceeded SF RWQCB ESLs for TPH-diesel, TPH-hydraulic fluid and TPH-motor oil, with concentrations of 2,400 mg/kg, 3,000 mg/kg and 2,500 mg/kg, respectively. This sample did not exhibit greater odor or staining than other samples collected in this area. No further over-excavation was performed at the northern hoist.

As over-excavation progressed, confirmation samples were collected from over-excavated areas, primarily the floor of the excavation. Several samples collected from the floor of the dispenser area and northern UST pit area exceeded the EPA Region 9 and SF RWQCB ESLs for benzene, with concentrations as high as 2.4 mg/kg. Several samples exceeded the SF RWQCB ESL for TBA, with concentrations as high as 0.37 mg/kg, and sample EX8-6.5' exceeded the SF RWQCB ESL for MTBE with a concentration of 0.071 mg/kg. The soil characterized by these confirmation samples was not over-excavated.

Groundwater

The initial water sample collected from the UST pit exceeded SF RWQCB ESLs for aquatic toxicity and drinking water Maximum Contaminant Levels (MCLs) for TPH-gas, TPH-diesel, benzene, toluene, ethylbenzene and xylenes, with concentrations of 24,000 micrograms per liter (ug/L), 1,300 ug/L, 810 ug/L, 8,300 ug/L, 1,300 ug/L and 7,900 ug/L, respectively; the sample also exceeded the ESL for naphthalene, with a concentration of 190 ug/L, and the drinking water MCL for MTBE, with a concentration of 22 ug/L. A subsequent water sample was collected after dewatering approximately 40,000 gallons from the tank pit, a substantial portion of which was due to precipitation. The second water sample exceeded the SF RWQCB drinking water MCL for benzene, with a concentration of 3.8 ug/L; all other compounds of concern were below their respective screening levels.

SECTION 6.0

CONCLUSIONS AND RECOMMENDATIONS

Versar, Inc. (Versar) has performed a Supplemental Phase II Environmental Site Assessment (ESA) of the Station Park Green property located 1700, 1750 and 1790 S. Delaware Street in San Mateo, San Mateo County, California (Site). This report has been prepared to conform to the scope and limitations of the American Society for Testing and Materials Standard Practice E1903-97, *Standard Guide for Environmental Site Assessments: Phase II Environmental Site Assessment Process*. The results of the initial and Supplemental Phase II ESAs have identified and characterized several locations where concentrations of contaminants of concern in soil and groundwater exceed applicable action levels (SFRWQCB ESLs).

At the north side of the Shell station, the initial Phase II ESA identified actionable concentrations of benzene (640 µg/L), nickel (up to 1,700 µg/L) methylene chloride, 1,2-DCA and lead in groundwater samples collected from borings advanced next to a car wash clarifier and a former waste oil tank (borings B1 and B3). The high levels of benzene and nickel indicated an apparent release from one or more of the Shell service station features. Groundwater samples collected from three supplemental borings (B18, B19 and B20) did not further identify elevated concentrations of benzene, nickel or VOCs north of the Shell station area. However, a groundwater sample collected from boring B19, located north of boring B3, identified actionable concentrations of TPH-g and –d, suggesting a release has occurred from a source in that area. Soil samples collected from boring B19 did not identify concentrations of contaminants exceeding their respective ESL.

Borings B22 and B23 were sampled to further delineate an apparent release of TPH in the oil and diesel range that has impacted mostly soil at the south side of the Michael's (former Montgomery Ward auto service center) building. Based on the soil data from this area an estimated 1,100 cubic yards of shallow soil has been impacted with TPH. An actionable concentration of lead was previously identified in a soil sample near the southwest corner of the Michaels, but was not identified elsewhere. Soil at the oil/water separator location (B5 and B6) was vertically delineated; indicating the TPH impacts appear localized to the shallow soil profile adjacent to the clarifier. Versar recommends removal and appropriate disposal of impacted soil from the area delineated by borings B4 – B6. Evidence of groundwater impact by TPH was noted in one sample (B6 at 170 µg/L), and nickel (B23) at 2,300 µg/L.

Soil and groundwater samples collected from beneath the former Montgomery Ward auto service center identified soil contaminated with TPH-d and -mo between 6 and 12 feet bgs. The detected soil contamination exceeded the ESLs for TPH-d and –mo. The soil contamination is likely associated with former lifts. PCBs were not detected at this location.

Groundwater samples were collected from three borings (B31, B32 and B33) near the southwestern corner of the Site to delineate concentrations of TPH-g, -d and -mo exceeding action levels in boring B12. Boring B33 identified 670 µg/L of TPH-d in groundwater approximately 50 feet southeast of boring B12. Groundwater samples collected from borings B31 and B32, located approximately 50 feet northwest and northeast, respectively, did not identify actionable concentrations of contaminants. Groundwater contamination at this location appears to be restricted to the area surrounding boring B12, extending and decreasing southeast along the property boundary to the B33 area.

5330 Primrose Drive, Suite 147
Fair Oaks, CA 95628
916.962.1612
www.versar.com

Shallow soil impacts of TPH as gas, diesel and oil were identified at multiple locations in the southwestern portion of the Site. Soil samples collected in this area identified deeper soil contamination (at 9 and 12 feet bgs) at one location, boring B30. Elsewhere in this area, actionable TPH concentrations appear limited to the upper five feet of the subsurface. The volume of petroleum-impacted soil is estimated to be 7,500 cubic yards. Versar recommends removal and appropriate disposal of impacted soil, which may be performed during Site grading activities prior to redevelopment construction.

Nickel in groundwater exceeded applicable ESL at eight locations throughout the Site with concentrations ranging from 11 to 2,300 µg/L. The two highest detections are located southeast of the former Montgomery Ward auto service center and northwest of the Shell service station. Nickel concentrations greater than 100 µg/L appear to be associated with TPH and other organic contaminants. The presence of nickel in groundwater across the Site may be associated with its solubility in relation to high organic carbon concentrations and/or anaerobic conditions.

Shell Service Station

The Shell service station has been completely removed. Contamination of soil and groundwater was encountered and largely removed during the removal of associated underground piping, clarifiers and surface features. Based on split confirmation samples collected by Versar, residual concentrations of benzene and TPH exceeding prospective levels for protection of groundwater as a non-drinking water resource are documented in limited areas of the former Shell station. Additionally, an incompletely destroyed groundwater monitoring well was left at the Site for proper abandonment.

STATEMENT OF LIMITATIONS

The data presented and the opinions expressed in this report are qualified as follows:

- The sole purpose of the investigation and of this report is to assess the physical characteristics of the Site with respect to the presence or absence of oil or hazardous materials and substances in the environment as defined in the applicable state and federal environmental laws and regulations and to gather information regarding current and past environmental conditions at the Site.

- Versar derived the data in this report primarily from visual inspections, examination of records in the public domain, and interviews with individuals with information about the Site. The passage of time, manifestation of latent conditions, or occurrence of future events may require further exploration at the Site, analysis of the data, and reevaluation of the findings, observations, conclusions, and recommendations expressed in the report.

- In preparing this report, Versar has relied upon and presumed accurate certain information (or the absence thereof) about the Site and adjacent properties provided by governmental officials and agencies, the Client, and others identified herein. Except as otherwise stated in the report, Versar has not attempted to verify the accuracy or completeness of such information.

- The data reported and the findings, observations, conclusions, and recommendations expressed in the report are limited by the Scope of Services. The Scope of Services was defined by the requests of the Client, and the availability of access to the Site.

- The findings, observations, conclusions, and recommendations expressed by Versar in this report are limited to the information obtained and should not be considered an opinion concerning the compliance of any past or current owner or operator of the Site with any federal, state, or local law or regulation. No warranty or guarantee, whether expressed or implied is made with respect to the data reported or findings, observations, conclusions, and recommendations expressed in this report. Further, such data, findings, observations, conclusions, and recommendations are based solely upon Site conditions in existence at the time of investigation.

- This report has been prepared on behalf of the Client, and is subject to and issued in connection with the Agreement and the provisions thereof.

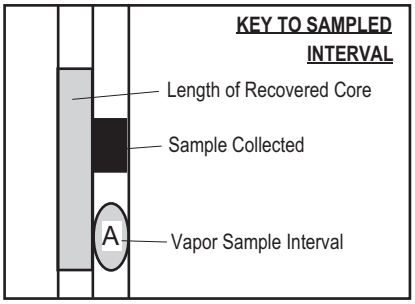
APPENDIX A

BORING LOGS

SYMBOL	LETTER	DESCRIPTION	MAJOR DIVISIONS			
	GW	WELL-GRADED GRAVELS OR GRAVEL-SAND MIXTURES, LITTLE OR NO FINES	**CLEAN GRAVELS** (LITTLE OR NO FINES)	**GRAVELS** MORE THAN HALF OF COARSE FRACTION IS LARGER THAN NO. 4 SIEVE SIZE	**COARSE GRAINED SOILS** MORE THAN HALF OF MATERIAL IS LARGER THAN NO. 200 SIEVE SIZE	**THE NO. 200 U.,S. STANDARD SIEVE IS ABOUT THE SMALLEST PARTICLE VISIBLE TO THE NAKED EYE**
	GP	POORLY-GRADED GRAVELS OR GRAVEL-SAND MIXTURES, LITTLE OR NO FINES				
	GM	SILTY GRAVELS, GRAVEL-SAND-SILT MIXTURES	**GRAVELS WITH FINES** (APPRECIABLE AMOUNT OF FINES)			
	GC	CLAYEY GRAVELS, GRAVEL-SAND-CLAY MIXTURES				
	SW	WELL-GRADED SAND OR GRAVELLY SANDS, LITTLE OR NO FINES	**CLEAN SANDS** (LITTLE OR NO FINES	**SANDS** MORE THAN HALF OF COARSE FRACTION IS SMALLER THAN NO. 4 SIEVE SIZE FOR VISUAL CLASSIFICATION, THE 1/4" SIZE MAY BE USED AS EQUIVALENT TO THE NO. 4 SIEVE SIZE		
	SP	POORLY GRADED SANDS OR GRAVELLY SANDS, LITTLE OR NO FINES				
	SM	SILTY SANDS, SAND-SILT MIXTURES	**SANDS WITH FINES** (APPRECIABLE AMMOUNT OF FINES)			
	SC	CLAYEY SANDS, SAND-CLAY MIXTURES				
	ML	INORGANIC SILTS, VERY FINE SANDS, ROCK FLOUR, SILTY OR CLAYEY FINE SANDS OR CLAYEY SILTS WITH SLIGHT PLASTICITY	**SILTS AND CLAYS** (LIQUID LIMIT LESS THAN 50)		**FINE GRAINED SOILS** MORE THAN HALF OF MATERIAL IS SMALLER THAN NO. 200 SIEVE SIZE	
	CL	INORGANIC CLAYS OF LOW TO MEDIUM PLASTICITY, GRAVELLY CLAYS, SANDY CLAYS, SILTY CLAYS, LEAN CLAYS				
	OL	ORGANIC SILTS AND ORGANIC SILT-CLAYS OF LOW PLASTICITY				
	MH	ORGANIC SILTS AND ORGANIC SILT-CLAYS OF LOW PLASTICITY	**SILTS AND CLAYS** (LIQUID LIMIT GREATER THAN 50)			
	CH	INORGANIC CLAYS OF HIGH PLASTICITY, FAT CLAYS				
	OH	ORGANIC CLAYS OF MEDIUM TO HIGH PLASTICITY, ORGANIC SILTS				
	PT	PEAT AND OTHER HIGHLY ORGANIC SOILS	**HIGHLY ORGANIC SOILS**			
	RK	BEDROCK	**BEDROCK**			
	FL	FILL				

WELL CONSTRUCTION SYMBOLS

- BENTONITE
- SAND
- SCREEN
- CEMENT



TYPES OF SAMPLERS

SPT	Standard Penetration 1.4" ID Split Spoon Sampler
CS	2" ID Split Spoon Sampler
MC	2.4" ID California Sampler
SH	3.0" ID Thin-Wall (Shelby Tube)
CC	2.7" ID Double Tube Continuous Coring Sampler

NOTES

ND	Denotes concentration below the test detection limits
--	Denotes not analyzed
PID	Photoionization Detector Reading in ppm

APPENDIX B

SHELL SERVICE STATION REMOVAL MONITORING REPORT

January 20, 2015

Mr. Sean O'Shea
Underwriting Analyst
Essex Property Trust, Inc.
925 East Meadow Drive
Palo Alto, California 94303

Subject: Shell Service Station Removal Monitoring Report
Station Park Green
1790 S. Delaware Street
San Mateo, California
Versar Project No. 105071.0064.001

Dear Mr. O'Shea:

Enclosed please find Versar, Inc.'s report titled Shell Service Station Removal Monitoring Report, 1790 S. Delaware Street, San Mateo, California (Site). This report describes and documents activities and conditions observed during the demolition and removal of the Shell service station. From 5th to the 18th of December 2014 Versar, Inc. (Versar) observed demolition of the Shell service station and removal of all known appurtenances, above and below ground, including the removal of underground storage tanks (USTs), fuel dispenser catch basins and fuel piping. Bureau Veritas (an environmental consultant representing AU Energy, the company responsible for the Site improvements) directed Sparger Technologies (Sparger) to collect soil and water samples from areas that exhibited odor or staining; Versar collected split samples from Sparger. Excavation of impacted soil was guided by Bureau Veritas and informed by analytical data obtained by Sparger.

Versar's report comprises a daily log of observed activities and conditions, followed by a summary of the results of analytical laboratory testing of split samples. Attachments to this report comprise figures depicting the Site location, layout and sample locations, tabulated summaries of sample results, and the laboratory analytical reports.

ACTIVITIES

December 5, 2014 – Walton Engineering, the demolition contractor, removed and disposed of three gasoline USTs, four fuel dispenser catch basins and fuel distribution piping from the southern and central Site. A sweet odor was observed in the annular material surrounding the USTs; Walton Engineering believed that the odor is due to fiberglass resin. Groundwater was observed in the UST pit.

Much of the overburden from the UST area was stockpiled onsite; this material was subsequently used to fill excavated areas. The stockpiled material exhibited a slight petroleum odor and photoionization detector (PID) readings as high as 15 parts per million (ppm).

Potentially impacted soil was removed from the areas of the fuel dispensers and piping; excavation of these areas was guided by odor, staining, sheen or PID response. Odors and staining were strongest in the fuel dispenser island area. A layer of black, odor-bearing soil was encountered from three and one-half feet below grade surface (bgs) to five feet bgs in the UST pit, and from three feet bgs to six feet bgs in the piping trenches and fuel dispenser area.

Sparger Technologies and Versar collected soil samples beneath the fuel dispensers, beneath the fuel piping and from the north and south walls of the UST pit. A sample of the groundwater in the UST pit was collected.

December 9, 2014 – Walton Engineering removed the clarifier beneath the former carwash. Prior to removal, a sheen was visible on the water contained within the clarifier. PID readings as high as 1.5 ppm were observed in the interior of the clarifier.

As the carwash clarifier was being removed a strong rotten egg odor was observed. Soil adjacent to the clarifier exhibited staining and PID readings as high as 8.0 ppm. No sheen or petroleum odor was observed in the soil surrounding the clarifier.

December 10, 2014 – Versar located the casing of monitoring well S-4. The well casing was open and appeared to have not been grouted; the screened section of the well casing was visible. Versar informed Bureau Veritas, who informed San Mateo County personnel; it appears that Conestoga- Rovers (former Site consultant) is responsible for the disposition of the well.

Versar was not able to locate former monitoring wells S-5B or S-6, the former waste oil UST to the southwest of the service station building, or any remnants of those features.

Walton Engineering removed three hydraulic hoists and a clarifier from the former service station building. At the direction of Bureau Veritas, Sparger and Versar collected soil samples from beneath each hoist, beneath the hoist-associated clarifier and beneath the carwash clarifier.

December 15, 2014 – The water level in the UST pit was observed to be one foot bgs after several days of heavy rain. Walton Engineering attempted to dewater the UST pit; this was unsuccessful due to continued heavy rain and groundwater infiltration. Approximately 40,000 gallons of water were removed from the UST pit and hauled offsite by Ponder Environmental. After the attempted dewatering the water level in the UST pit was approximately two feet bgs.

December 16, 2014 – In response to analytical data obtained by Sparger showing petroleum and benzene impacts, Walton Engineering over-excavated the fuel dispenser area. The layer of stained soil surrounding the fuel dispensers became thinner as the distance from the dispensers increased; approximately ten feet from the dispensers the stained soil was encountered from four feet bgs to six feet bgs.

Fair Oaks, CA 95628
916.962.1612
www.versar.com

Strong petroleum odors and staining were observed to the north of the dispenser area, in the area of the four former USTs.

The dispenser area was over-excavated to approximately seven feet bgs. The underlying soil comprised blue-gray clay with tan mottles and root hairs; no petroleum odor or staining was observed. Sparger and Versar collected samples from the floor of the excavation under the fuel dispenser area and to the north.

The central hydraulic hoist and the hoist-associated clarifier locations were over-excavated and soil samples were collected from beneath each feature.

PID readings as high as 30 ppm were observed during the excavation of the dispenser area.

December 17, 2014 –Walton Engineering continued over-excavation of the former UST pit north of the fuel dispenser area. This soil was live-loaded for offhaul; impacted soil was not stockpiled on site. Strong petroleum odors, greasy staining and PID hits as high as 45 ppm were observed in the former UST pit area.

Stained soil remained in place in the eastern sidewall of the fuel dispenser area excavation; this sidewall was braced with drain rock to prevent slumping. This sidewall was not excavated further because of the presence of underground utilities and the South Delaware Street sidewalk.

Sparger and Versar collected samples of the water in the UST pit.

December 18, 2014 – Walton Engineering continued over-excavation of the former UST pit area. The stained, odor-bearing soil layer stopped approximately 20 feet south of the northern boundary of the Site; soil to the north of this area comprised mixed blue and gray sand with no odor or staining and was believed to be fill. Over-excavation of the former UST pit was discontinued.

Walton Engineering over-excavated the piping trenches and the north sidewall of the UST pit until presumed native, unimpacted soil was observed; Sparger and Versar collected samples of this soil.

Walton Engineering completed over-excavation on December 18 and does not intend to excavate further.

SUMMARY OF SAMPLE RESULTS

Soil

Several soil samples collected during the initial characterization sampling event on December 5 exceeded EPA Region 9 Environmental Screening Levels (ESLs) and San Francisco Bay Regional Water Quality Control Board (SF RWQCB) ESLs for residential use, with concentrations of gas-range total petroleum hydrocarbons (TPH-g), naphthalene, benzene, xylenes, tertiary butanol (TBA) and methyl tertiary-butyl ether

5330 Primrose Drive, Suite 147
Fair Oaks, CA 95628
916.962.1612
www.versar.com

(MTBE) as high as 430 milligrams per kilogram (mg/kg), 2.9 mg/kg, 3.0 mg/kg, 3.2 mg/kg, 0.19 mg/kg and 0.18 mg/kg, respectively.

Because the data obtained from the December 5 sampling event was used to guide the over-excavation, most of the soil characterized during the December 5 sampling event was subsequently excavated and removed from the Site: All piping trench, dispenser catch basin and north UST pit wall areas were over-excavated and removed. This includes all soil characterized by samples PT1-6' through PT12-6', UDC 1/2-6' through UDC 7/8-6' and T1N-7' through T3N-8'.

Samples collected from soil remaining in the south UST pit wall exhibited concentrations of benzene, TBA and MTBE as high as 0.11 mg/kg, 0.15 mg/kg and 0.18 mg/kg, respectively. This soil was not over-excavated due to proximity to the property line, sidewalk and street.

Soil samples collected from the area of the hydraulic hoists and hoist-associated clarifier exhibited benzene concentrations as high as 0.54 mg/kg. The central hoist and the hoist-associated clarifier areas were over-excavated; subsequent confirmation samples collected from these areas did not exceed regulatory screening levels for compounds of concern.

Versar's split sample "Hoist 3 – 9'", collected from beneath the northern hoist exceeded SF RWQCB ESLs for TPH-diesel, TPH-hydraulic fluid and TPH-motor oil, with concentrations of 2,400 mg/kg, 3,000 mg/kg and 2,500 mg/kg, respectively. This sample did not exhibit greater odor or staining than other samples collected in this area. No further over-excavation was performed at the northern hoist.

As over-excavation progressed, confirmation samples were collected from over-excavated areas, primarily the floor of the excavation. Several samples collected from the floor of the dispenser area and northern UST pit area exceeded the EPA Region 9 and SF RWQCB ESLs for benzene, with concentrations as high as 2.4 mg/kg. Several samples exceeded the SF RWQCB ESL for TBA, with concentrations as high as 0.37 mg/kg, and sample EX8-6.5' exceeded the SF RWQCB ESL for MTBE with a concentration of 0.071 mg/kg. The soil characterized by these confirmation samples was not over-excavated.

Groundwater

The initial water sample collected from the UST pit exceeded SF RWQCB ESLs for aquatic toxicity and drinking water Maximum Contaminant Levels (MCLs) for TPH-gas, TPH-diesel, benzene, toluene, ethylbenzene and xylenes, with concentrations of 24,000 micrograms per liter (ug/L), 1,300 ug/L, 810 ug/L, 8,300 ug/L, 1,300 ug/L and 7,900 ug/L, respectively; the sample also exceeded the ESL for naphthalene, with a concentration of 190 ug/L, and the drinking water MCL for MTBE, with a concentration of 22 ug/L. A subsequent water sample was collected after dewatering approximately 40,000 gallons from the tank pit, a substantial portion of which was due to precipitation. The second water sample exceeded the SF RWQCB drinking water MCL for benzene, with a

5330 Primrose Drive, Suite 147
Fair Oaks, CA 95628
916.962.1612
www.versar.com

concentration of 3.8 ug/L; all other compounds of concern were below their respective screening levels.

CONCLUSION

The Shell service station has been completely removed. Contamination of soil and groundwater was encountered and largely removed during the removal of associated underground piping, clarifiers and surface features. Based on split confirmation samples collected by Versar, residual concentrations of benzene and TPH exceeding prospective action levels for protection of groundwater as a non-drinking water resource are documented in limited areas of the former Shell station. Additionally, an incompletely destroyed groundwater monitoring well was left at the Site for proper abandonment.

Versar appreciates the opportunity to support Essex Property Trust on this project. Please contact me at (916) 863-9323 should you have any questions or comments regarding this report.

Sincerely,

Tim Berger, PG
Operations Manager
Environmental Services Group

Notes and Abbreviations:
Values in bold meet or exceed screening level

[1] Reporting Limit varies by analyte.

LOC = Location of Concern
< = Less than the method reporting limit
ESL = Environmental screening level
mg/kg = milligram per kilogram
NA = Not analyzed
No Std = No Standard
TTLC = Total Threshold Limit Concentration
PRG = Preliminary Remediation Goals
VOCs = Volatile Organic Compounds
TBA = Tertiary Butanol
MTBE = Methyl Tertiary-Butyl Ether
ETBE = Ethyl Tertiary-Butyl Ether
DIPE = Di-Isopropyl Ether
TAME = Tertiary-Amyl Methyl Ether
p-IT = p-Isopropyltoluene
1,3,5-TMB = 1,3,5-Trimethylbenzene
t-BB = Tertiary Butylbenzene

ND = Not Detected Above Laboratory Reporting Limit
RWQCB = Regional Water Quality Control Board
TPH = Total Petroleum Hydrocarbons
TPH-g = Gasoline Range TPH
TPH-d = Diesel Range TPH
TPH-hf = Hydraulic Fluid Range TPH
TPH-mo = Motor Oil Range TPH
PCBs = Polychlorinated Biphenyls
SVOCs = Semivolatile Organic Compounds
1,2-DCA = 1,2-Dichloroethane
1,2-DBA = 1,2-Dibromoethane (Ethylene dibromide)
n-BB = n-Butylbenzene
sec-BB = sec-Butylbenzene
IB = Isopropylbenzene
n-PB = n-Propylbenzene
1,2,4-TMB = 1,2,4-Trimethylbenzene

Notes and Definitions

QM-07	The spike recovery and or RPD was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.
D-08	Hydrocarbon pattern present in the diesel range, but appears to be from gasoline range overlap and does not match the diesel pattern.
D-02	Hydrocarbon pattern present in the requested fuel quantitation range, but does not resemble the pattern of the requested fuel.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

Subject: Request for analysis change for Versar, Inc. samples shipped on 12/18/14

Dan, Lori,

I dropped some samples off yesterday at your West Sacramento office for a project called "Station Park Green Shell Station Removal". I need to change the requested analyses as follows:

For samples that begin with "EX" or "Tank Pit", please change the analysis to 8015 carbon chain (full range TPH), 8260 BTEX, oxygenates (5-oxy), lead scavengers and naphthalene. We do not need 8260 full list or 8082 PCBs for these samples.

For the samples starting with "Clarifier" or "Hoist", please run the analyses listed on the COC.

Thank you for your time; sorry about the error.

HEALTH & SAFETY PLAN DOCUMENTATION

8.0 DOCUMENTATION

8.1 Site Safety Plan Agreement

In the situation that contamination is encountered which could come into contact with site development personnel, all details of this site safety plan will be implemented. Versar personnel have the authority to stop work performed by our subcontractors at this site if any work is not performed in accordance with the requirements of this site safety plan.

All Versar project personnel and subcontractor personnel are required to sign the following agreement prior to conducting work at the site.

A. I have read and fully understand the site safety plan and my individual responsibilities.

B. I agree to abide by the provisions of the site safety plan.

Notes and Definitions

R-07	Reporting limit for this compound(s) has been raised to account for dilution necessary due to high levels of interfering compound(s) and/or matrix affect.
QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to possible matrix interference. The LCS was within acceptance criteria. The data is acceptable as no negative impact on data is expected.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

	Essex Portfolio, L.P.	

Scope:

- General observation/non-intrusive activities
- Drilling (direct-push)
- Soil sampling (hand-auger/direct-push/excavator)
- Groundwater sampling (excavation)

Hazard Summary:

- Mechanical - material handling, slip/trip, struck-by injuries
- Underground and overhead utilities
- Noise – heavy equipment, road traffic, drill rig
- Biological - bites or stings
- Chemical – nickel, lead, petroleum hydrocarbons, 1,2-dichloroethane

Control Summary:

- Personal Protection Equipment (PPE) - Safety vests/hard hats/safety glasses/steel-toed boots
- Site Control - utility location/identification
- Hearing protection – ear plugs/muffs
- Site inspection & awareness; repellent
- Engineering controls/isolation/PPE - safe (wet) sampling methods & work practices; protective gloves; sanitation.

Hospital Reference: Sequoia Hospital
170 Alameda de las Pulgas, Redwood City, CA

Directions: From the Site, ENTER Hwy 92 West to Interstate 280. SOUTH on I-280 to Edgewood Road. EAST on Edgewood Rd. to RIGHT on Alameda de las Pulgas. Arrive at the hospital (see Vicinity Map, Figure 1).

Emergency Assistance:

Fire/Police/Medical Assistance: **911**
Poison Control: **800.876.4766**

1.0 INTRODUCTION

This Health and Safety Plan (HSP) is a compilation of health and safety guidelines, policies and/or performance protocols that, when exercised, are intended to reduce or eliminate the potential for injury and exposure during the performance of the activities at the site described below. Conformance with its contents does not warrant that injuries or exposures will not occur.

This HSP is not a training tool and does not contain the degree of detail necessary to train an employee on the appropriate performance, approach and/or equipment-use protocols referenced, herein. Persons working on this project and referring to this HSP shall meet the minimum training requirements described in Section 2.2.

This HSP has been prepared to specifically support the field activities described herein. The provisions described herein apply to employees of Geocon Consultants, Inc. and its subcontractors, only. Representatives of the Client, Client-retained subcontractors, and representatives of State or local government agencies are expected to observe the safety rules and requirements established by their respective organizations, provided they do not conflict with this HSP. However, Geocon will not be responsible for enforcing the conditions of this HSP on these representatives.

The contents of this HSP are based on factors and conditions understood prior to the start of the field activities. If those factors and conditions change during the performance of the activities, including the service scope, or if conditions exist that were not considered in the preparation of this HSP, then such shall be brought to the immediate attention of the person approving this HSP, and the HSP shall be modified, accordingly. The date indicated in Section 8.0 of this document indicates the latest version of this HSP.

A pre-job conference will be held to delineate roles and responsibilities, discuss key elements of the HSP, and coordinate activities. This HSP is a "working document" to be used by affected personnel. The HSP may be modified at any time in accordance with Section 1.4 to adequately address changing conditions or previously unrecognized exposure hazards which may be encountered during the project. An updated, current copy of the HSP will be maintained at the project site and be available to all affected personnel.

1.1 Project Location and Description

Site Location: Station Park Green Development, 1700 South Delaware Street, San Mateo, California

1.2 Background

There are three general areas requiring cleanup actions based on the findings of Phase I, Phase II, and Supplemental Phase II Environmental Site Assessments. The prospective action areas are based on

comparison of San Francisco Bay Area Regional Water Quality Control Board (SFRWQCB) December 2013 Environmental Screening Levels (ESLs) with contaminant concentrations measured in soil, soil vapor, and groundwater at the Site. The ESLs applied are for residential land use, shallow soil, with groundwater not considered to be a drinking water resource

Action Area #1 consists of the southwest corner of the Site, from the boundary with the Caltrain property and Concar drive to the west and south, approximately the former K-Mart building to the east, and extending northward approximately two-thirds the length of the K-Mart building. Within this area concentrations of total petroleum hydrocarbons (TPH) greater than 100 milligrams per kilogram (mg/k)g were encountered in soil primarily above 5 feet in depth. However, in the northern and southwestern portions, TPH was encountered to depths of 12 feet, likely to the surface of the Bay Mud. In the southwest location, TPH was encountered in perched groundwater at a depths of approximately 12 to 20 feet at concentrations of 670 to 190,000 micrograms per liter (µg/l), suggesting the presence of free product in shallow (perched) groundwater.

Cleanup of this area is proposed to primarily coincide with site grading operations, with approximately 7,500 cubic yards (cy) soil containing TPH to be removed as non-hazardous waste. Impacted soil below the site finish grade plus pavement and building sections will be spot-excavated to groundwater. Impacted groundwater is anticipated to be removed from an excavation by vacuum truck. Soil excavation boundaries will be mapped and cleanup confirmation samples collected.

Action Area #2 consists of the area associated with the former Michael's building. On the south side of the building is located a suspected clarifier to be removed. The surrounding soil contained TPH and lead. A grab-groundwater sample from this area contained nickel at a concentration exceeding the drinking water ESL. In the northeast corner of the building interior, TPH thought to be associated with former hydraulic lifts was encountered in soil at greater than the 100 mg/kg at depths of 6 and 12 feet. Polychlorinated biphenyls (PCB) were not identified in these samples.

Cleanup of this area is proposed to primarily coincide with site grading operations, with approximately 1,400 cy soil containing primarily TPH to be removed as non-hazardous. Impacted soil below the site finish grade plus pavement and building sections will be spot-excavated to groundwater. Impacted groundwater is anticipated to be removed from an excavation by vacuum truck until groundwater within the excavation meets the cleanup standard.

Action Area #3 consists of groundwater north of the former Shell service station and adjacent to a former waste oil tank located at the northwest corner of the former Michael's building. Concentrations of TPH, benzene, and 1,2-dichloroethane (1,2-DCA) were detected in groundwater. A soil vapor concentration of benzene greater than the residential indoor-air ESL was also detected in association with the elevated benzene concentration in groundwater.

Cleanup of this area, including the former Shell station footprint, is anticipated to consist of impacted groundwater removed from an excavation by vacuum truck. Soil excavation boundaries will be mapped and cleanup confirmation samples collected.

Localized occurrences of petroleum-impacted soil and groundwater are anticipated to be encountered throughout the Site during mass-grading and foundation excavation activities. Contaminated materials will be managed in accordance with the Soil and Groundwater Management Plan, of which this HSP is a part.

1.3 Project Objectives

The purpose of the Soil and Groundwater Management Plan is to remove and document the cleanup of contaminated soil and groundwater at the Site during construction grading and excavation.

1.4 Planned Scope of Services

- Drilling (direct-push, hand-auger, excavator)
- Soil sampling (direct-push)

1.5 Schedule

Anticipated Period of Performance: May through December 2015
Anticipated Weather/Temperature: Moderate to warm

2.0 ADMINISTRATIVE REQUIREMENTS/CONTROLS

2.1 Personnel

Personnel responsible for project safety include the Project Manager, the Site Safety Officer (SSO), and participating project personnel.

2.1.1 Project Manager

The Project Manager has ultimate authority and responsibility for project Health and Safety. Accordingly, he/she has the responsibility to develop the HSP (or assign its development); audit compliance with the provisions of this HSP; suspend project activities or modify service practices for health and safety reasons; and, to dismiss from a project site individuals whose onsite conduct either endangers the health and/or safety of others or is judged not to comply with the provisions of the HSP. The Project Manager is responsible for sharing/distributing the HSP to participating field personnel and to an authorized representative of each project subcontractor. The Project Manager is also responsible for implementing all provisions of the HSP and any applicable addenda. Implementation includes:

- Reviewing the HSP requirements (if prepared by another project member);
- Presenting an overview of the provisions of the HSP with project participants;
- Providing the safety equipment specified herein;
- Collecting and submitting the requisite health and safety documentation (training rosters/certificates, air monitoring records (exposure assessments); site personnel logs, medical approvals), and copying them to the SSO, if appropriate; and

  Note: Monitoring and exposure assessment records will be maintained in accordance with the provisions of T8 CCR §1532.1(n) Lead, which is representative of T22 metals and 3204 Access to Employee Exposure and Medical Records.

- Designating/identifying a qualified project member as the SSO.

2.1.2 Site Safety Officer

The designated SSO is responsible for assisting the Project Manager with onsite implementation of the HSP. The SSO's responsibilities include:

- Maintaining project safety equipment supplies;
- Performing air monitoring, if and as specified herein (ref: T8 CCR §1532.1(d) Exposure Assessment);
- Directing decontamination procedures, as appropriate;
- Enforcing the provisions of this HSP;
- Directing emergency response operations until public emergency personnel arrive;
- Setting up Site Controls, if and as specified herein; and
- Reporting all incidents and infractions to the Project Manager.

The SSO has the authority to suspend project activities any time he/she determines that the provisions of the HSP are inadequate to provide a service/project environment conducive to employee safety. Further, the SSO is to inform the Project Manager of any individuals whose onsite actions jeopardize either their health and safety or the health and safety of others.

2.1.3 Project Field Staff

All project personnel are responsible for:

- Complying with the provisions of this HSP;
- Performing services in a manner that is consistent with good health and safety practice; and
- Reading and being knowledgeable of the contents of this HSP.

2.2 Personnel Training

2.2.1 General Site Employees

Site employees will attend a project orientation prior to starting the project. The orientation will review all elements of the HSP, including: 1) the location of potential health and safety hazards on the site and 2) requirements of the HSP. The training will also address other Cal/OSHA requirements such as the Geocon Hazard Communication Program (T8 CCR §5194), including the potential hazards of exposure to lead, representing T22 metals (T8 CCR §1532.1(l)), TPH, VOCs, and the Injury and Illness Prevention Program (T8 CCR §3203).

2.2.2 "Tailgate" Meetings

During the active field components of the project, the SSO or designee will conduct regular (i.e., weekly or daily, as appropriate) "tailgate" safety meetings. This meeting will include information on the following subjects, as applicable:

- Changes to project scope;
- Recognized changes to site conditions;
- Review of safe work practices;
- On or off the project safety practices;
- Feedback from employees on hazards, safety suggestions, or concerns; and
- Recognition for compliance, good safety performance or attitude.

Attendance at the tailgate meetings is considered a part of each employee's job responsibilities.

2.3 Medical Surveillance

Geocon and subcontractor employees required to wear respiratory protection shall have a current medical evaluation and approval by a physician or other licensed health care professional (PLHCP). Medical evaluations will be provided in accordance with the Geocon Respiratory Protective Equipment Program (ref. T8 CCR §5144(e) "Medical Evaluation"; §§1532.1(j) Lead – "Medical Surveillance").

> Note: Based on Negative Exposure Assessments from industrial hygiene monitoring for airborne lead performed for representative tasks, using similar controls, and carried out within the past twelve months (ref. T8 CCR §1532.1(d)(5)(A)), respiratory protective equipment will not be required for this project.

Project personnel are expected to arrive at the jobsite and be well rested and physically prepared to perform assigned tasks.

3.0 HAZARD AND CONTROL ANALYSIS

The following hazards were assessed to either exist, or have the potential to develop, during the performance of the project activities:

	HAZARDS							
TASKS	MECHANICAL	ELECTRICAL/ UTILITY	NOISE	BIOLOGICAL	RADIOLOGICAL	THERMAL	CHEMICAL	OTHER
Driving	**X**							
Drilling (direct-push)	**X**	**X**	**X**	**X**			**X**	
Soil sampling (direct-push, hand-auger, excavator)	**X**	**X**	**X**	**X**			**X**	
Groundwater Sampling							**X**	

3.1 Safe Driving

Hundreds of workers are injured or die in job-related motor vehicle accidents annually. Motor vehicle accidents are one of the number-one causes of employee injuries and deaths. Most accidents can be avoided by practicing defensive driving. Geocon policies mandate that employees:

- Prepare themselves and their vehicle for the road before travel;
- Drive according to posted speed limits unless adverse conditions necessitate slower speeds;
- Never tailgate, employ the three-second rule in following vehicles;
- Follow California State law and other local laws and regulations regarding the use of cellular phones for communication while driving;
- Additionally, talking on a cell phone and/or texting is prohibited while operating sampling equipment;
- Use practical driving procedures in cities, on the freeway, and in rural areas; and,
- Follow all site driving directions and practices prepared for the Site by the Client.

3.2 Mechanical Hazards

Type(s)/Source:

- Material Handling/Back Injury
- Striking (slips, trips); and
- Struck-by injuries

Qualified Exposure Risk: Moderate

Hazard Control(s):

- Safe Lifting
- Isolation – traffic control/work methods/no work during inclement weather or darkness
- PPE – ANSI approved Class III safety vests & night (low visibility) ensemble, hardhats, safety glasses

3.2.1 Material Handling/Back Injury

Hazard: It is expected that field personnel will be required to lift heavy equipment and supplies and/or perform arduous tasks during this project. Accordingly, back injuries or physical strain may be caused by: routine lifting or one-time-only lifting; the weight of a lifted object; the frequency of lifting; bending, twisting, or rotating during lifting; prolonged sitting; exposure to vibrations; poor arch support in shoes; and, not stretching prior to physical activity. If the following "control" mechanisms are not exercised, debilitating back injury may occur.

Control(s): Before attempting to lift and carry an object, always test its weight first. If it is too heavy, get help. If possible, use mechanical lifting aids. If manageable, the proper method for lifting is:

- Get a good footing;
- Place feet about shoulder width apart;
- Bend knees to pick up load. Never bend from the waist;
- Keep back straight;
- Get a firm hold. Grasp opposite corners of the load, if possible;
- Keep the back as upright as possible;
- Lift gradually by straightening the legs - don't jerk the load;
- Keep the weight as close to the body as possible; and
- When changing directions, turn the entire body, including the feet. Don't twist the body.

If devices are used for handling materials manually (e.g., two-handed lifters, barrel ring clamps, hand trucks, wheelbarrows, etc.), wear protective equipment like gloves and safety shoes to minimize the potential of appendages becoming pinched or smashed between the load and stationary features. Also, avoid overloading the device.

3.2.2 "Striking" Injuries

Hazard: Injuries can, and often, result when a person (a kinetic mass) unexpectedly instigates contact with another kinetic mass. These occurrences typically result from inadvertent slips, trips and falls.

Control(s): To minimize risks of "slip/trip" hazards, personnel shall maintain a constant program of good housekeeping, keeping areas clear of trip hazards and wet and slippery surfaces. All hand tools

shall be regularly secured and care shall be taken when entering areas where work is being performed above eye level.

3.2.3 "Struck-by" Injuries

Hazard: Injuries can, and often, result when workers are the unexpected receptor of contact with another kinetic mass. These occurrences typically result from the worker being struck by a dropped or collapsed mass, a moving piece of equipment, or more likely a moving vehicle.

Control(s): Engage the vehicle's warning light bar whenever operating within an area of active grading operations. When stopped or parked, continue use of the light bar. Employees/workers shall not exit the vehicle until they have located nearby operating heavy equipment. Geocon employees will be required to wear hard hats and fluorescent vests. Employees shall always make eye contact with any nearby heavy equipment operators before moving and stopping vehicles within the equipment vicinity, and approaching heavy equipment.

3.3 Overhead and Underground Utilities - Electrical Hazards

Type(s)/Source: Underground and overhead

Qualified Exposure Risk: Moderate – Drilling (direct-push)

Primary "Control": Isolation - contact USA, independent Utility Locator

Hazard: Contact with electrical current can cause shock, electrical burns, and/or be instantly fatal. If heavy equipment (e.g., drill rig) makes contact with electrical wires, it may or may not be insulated from the ground by the tires of the carrier. Under either circumstance, the human body, if it simultaneously comes in contact with the drill rig and the ground, will provide a conductor of the electricity to the ground.

Control(s): Demarcate all drilling/digging locations, first. Contact Underground Service Alert (USA) (1-800-227-2600) and review as-built plans before performing any excavation/drilling/coring activity. It is advised that a private utility locator be contacted to supplement USA's demarcations, especially when the project is on private property. Soil intrusive work shall not proceed until all locating activities have been completed and fully documented in the site records. The initial site safety orientation meeting for all personnel onsite shall include a review of the underground utility locations and the location of the site map, showing the position of any underground utility lines. The site safety orientation shall include a site walkover of each marked utility or line.

Should a sub-surface condition be encountered that creates suspicion that there may be an unidentified underground line or utility, immediately cease work and secure the equipment. Work will not proceed until the potential risk or condition is resolved.

3.4 Noise Hazards

Equipment operated at sampling sites may present a noise hazard to employees. In all cases where the sound pressure levels may exceed a time-weighted average noise dose of 85 decibels (the Action Level), the Project Manager or SSO will evaluate exposures according to the Geocon Hearing Conservation Program (ref. T8 CCR §§5095-5100). Selection of hearing protection will be made in accordance with the Geocon Safety Equipment Guide. Only hearing protectors (ear plugs or muffs) with a Noise Reduction Rating of 20 dB, or higher, will be used. When worn, earmuffs will be donned in the "over the head" position with the hair pulled back from the sealing surface.

Note: In general, noise levels in excess of 85 dBA interfere with communication between two individuals speaking in a normal tone of voice at a distance of 3 feet from one another.

3.5 Biological Hazards

Type(s)/Source: Poison oak, biting vectors (mosquitoes) and animals.

Qualified Exposure Risk: Low

Primary "Control":

- Isolation (Attention to detail – avoidance)
- PPE (Gloves/boots/long-sleeve shirts)
- Insect repellent, barrier creams

Hazard: Contact with plants, insects, and animals likely to be present at the site should be avoided. Plants (such as poison oak or ivy) can cause an allergic reaction and skin rash in some individuals. Stinging and biting insects, including bees, spiders, and ticks, can cause extreme discomfort and/or serious allergic responses. Insect bites are generally not dangerous, unless they are from a poisonous insect or mosquitoes potentially carrying West Nile virus.

The primary concern with animal bites and scratches is the potential for infection and/or rabies. Snake or scorpion bites can also be dangerous, but more from infection or trauma than the toxins injected by the snake or scorpion.

Control(s): Avoid conducting site activities from dusk to dawn when the risk of encountering biting mosquitoes is higher. Insect repellent containing approximately 50% DEET can be used for protecting exposed skin from biting insects. These products are commercially available and may minimize the potential for development of skin rashes and/or irritations due to such exposures; apply insect repellent sparingly to exposed skin. Note: Avoid contacting plastic zippers or other plastic closure mechanisms on clothing, equipment bags, etc., with DEET containing crème which will cause these materials to degrade.

If unprotected contact with potentially poisonous plants does exist, wash with soap and water as soon as possible. If irritation still develops, apply First Aid and/or seek medical attention, accordingly. If you are allergic to bee or wasp stings, be sure to have the appropriate first aid available (e.g., an epi-pen) on the project. If you are stung, administer first aid and seek immediate medical attention.

Be sure a reptile or animal bite victim obtains medical attention quickly if a bite or scratch occurs, especially if there is a potential that it was poisonous. In the meantime, administer First Aid by scrubbing the wound with soap and water, and rinsing thoroughly under running water. Dry off and place a clean bandage on the wound. Victims of these bites should lie down and remain calm and motionless; cold packs should be applied and medical attention sought immediately.

3.6 Chemical Hazards

The risk of significant exposure to soil contaminants is considered to be low to moderate while performing the soil characterization tasks required on this project. Soil drilling methods (wet) and safe work practices to be employed will reduce the potential for significant exposures to airborne contaminants.

Detailed information regarding the physical description of petroleum hydrocarbons, metals and volatile organic compounds encountered at the Site including health hazards, routes of entry into the body, signs and symptoms of exposure, and target organs and chemical and physical properties are available in Attachment A – Guides and Summaries to Site Chemical Hazards and Exposure Limits.

3.6.1 Petroleum Hydrocarbons

Type(s)/Source:	Pollutants in soil, natural or man-made – former fuel additive. Petroleum fuels, lubricants, hydraulic fluid and waste oil
Exposure Route:	Skin contact, inhalation and ingestion
Exposure signs/symptoms:	See Attachment A – Guides and Summaries to Site Chemical Hazards and Exposure Limits.
Qualified Exposure Risk:	Low

Hazard Control:

- Isolation – site control
- Engineering Controls – Safe work practices and wet sampling procedures,
- Organic vapor detector –Use of field photo-ionization detector (PID) when working in probable and existing volatile organic vapor conditions
- PPE – eye (safety glasses or goggles) and, hand protection (leather and/or impermeable gloves)
- Sanitation – good personal hygiene follow sanitation and personal hygiene procedures outline in Section 4.2

4.0 GENERAL HEALTH AND SAFETY REQUIREMENTS

4.1 Air Monitoring

Industrial hygiene monitoring will not be performed for lead, petroleum hydrocarbon, or volatile organic compound (VOC) sampling tasks being carried out for this project. Previous Negative Exposure Assessments for representative tasks, using similar controls document exposures consistently below the 30 µg/m^3 Action Level for inorganic lead, a conservative approach representative of potential exposure to airborne metals (ref. T8 CCR §1532.1(d)(5)(A)) support non-performance. A PID will be used during the project to document ambient and operator breathing zone (OBZ) conditions for indications of VOC encounter, and changing and nuisance conditions.

4.2 Personal Hygiene

The SSO will establish hand-wash facilities, including clean water, hand soap, waterless hand cleaner, sanitary wipes and clean towels at the project site. All Geocon personnel, subcontractor employees, Client representatives leaving the project site (work zones) will clean potential impacted soils from their footwear and wash hands prior to leaving the project site. In addition, the following procedures will be followed to ensure worker protection against potential exposure through ingestion:

- Eating, drinking, chewing gum or tobacco, smoking, or any practice that increases the probability of hand-in-mouth transfer and ingestion of material is prohibited in any area designated as being potentially impacted.
- Hands and face must be thoroughly washed upon leaving the work area, and before eating, drinking, or other non-project activities.
- Kneeling, sitting, leaning, or general contact with potentially impacted surfaces or with surfaces suspected of being potentially impacted by hazardous materials (i.e., puddles, mud, leachate, etc.) should be avoided.

- Medicine and alcohol can potentiate the effects of exposure to toxic chemicals. Personnel should take neither if the likelihood of such potentiation exists. Being under the influence of alcohol during the field activities is prohibited.

4.3 Buddy System

Project personnel are to work with another person when performing sampling tasks; the client or a subcontractor's representative can serve as the second person while the work is being conducted in the field. Under no circumstances, other than completion of paper work at the end of the day, are field personnel to work alone at the site.

4.4 Work Zone Controls

Although formal work zones will not be required for this project, work areas will be isolated using traffic cones when working near streets, driveways, or in parking areas.

4.5 Code of Safe Practices

General safe work practices to be utilized by all project personnel are summarized below:

- All nonessential personnel will be kept clear of work areas.
- Adequate signs and safety devices will be installed on equipment.
- All site employees will wear assigned personal protective equipment and level of protection as designated by the SSO.
- Eating, drinking, smoking, chewing gum or tobacco, or application of cosmetics is allowed in designated areas only.
- At a minimum, all personnel will wash with soap and water before lunch, using the restroom, and at the end of work. The face and hands shall be washed before eating, drinking, smoking, chewing gum, applying cosmetics, etc.
- Over-the-counter drugs and prescription medications must be reported to the SSO for clearance before an employee is allowed to work near drill rig or other heavy equipment.
- When portable electric tools and equipment are used, three-wire extension cords are required.
- Employees will advise their supervisors of any malfunctioning equipment immediately.
- An ongoing safety maintenance program for tools and equipment will be instituted. Inspections will occur on a regular basis to ensure parts are secure and intact. Defective equipment will be repaired or replaced.
- Appropriate engineering controls and equipment guards will be installed on tools and equipment. This includes seat belts and backup warning lights and signals.
- A list of names of personnel who are trained in CPR and first aid shall be available.
- Labels shall be placed on containers of hazardous materials.
- No one will work alone; the "buddy system" shall be implemented for all field work.

- Employees shall be trained to identify effects and symptoms of toxic exposure and report them immediately.
- Under no circumstances are Geocon personnel authorized to enter a confined space.

5.0 PERSONAL PROTECTIVE EQUIPMENT

The employment of the aforementioned engineering controls is the preferred method of providing personal protection from hazards identified at this and any site. PPE provides acceptable secondary recourse, but only when engineering controls fail or cannot adequately eliminate exposure to the hazard. The use of PPE is intended to provide protection for onsite personnel from operational hazards that cannot be controlled through other safety procedures or work practices.

PPE required to be onsite for each worker during this project will include:

- ☒ Hard Hat (without face Shield)
- ☒ Leather Boots
- ☐ Chem. Resistant Boots
- ☒ Leather Gloves
- ☒ Ear Plugs/Muffs
- ☒ Orange Safety Vest
- ☐ Other
- ☒ Safety Glasses
- ☒ Disposable inner gloves (for sample handling)
- ☐ Chem. Resistant gloves
- ☐ Air-Purifying Respirator
- ☐ APR Cartridges
- ☐ Tyvek coveralls

Only ANSI approved PPE and NIOSH approved respirators will be assigned for use. The use applications for this equipment are summarized in the following matrix. Specific procedures are further described below.

	PPE												
TASKS	Hard Hat	Safety Glasses	Leather Boots	Chemical Resistant Boots	Disposable Inner Gloves	Chemical Resistant Gloves	Leather Gloves	Ear Plugs/Muffs	Air-Purifying Respirator	APR Cartridges	ANSI Safety Vest	Tyvek Coveralls	Other
General Survey Non-Intrusive Activities	**X**	**X**	**X**					**X**			**X**		
Drilling (direct-push)	**X**	**X**	**X**		**X**		**X**	**X**			**X**		
Soil sampling (direct-push, hand-auger, excavator)	**X**	**X**	**X**		**X**		**X**	**X**			**X**		
Groundwater sampling (excavation)	**X**	**X**	**X**		**X**			**X**			**X**		

5.1 Respiratory Protection

Respiratory protection will not be required during sampling activities. The Project Manager or SSO, in consultation with the Consulting Certified Industrial Hygienist, will determine the need for upgrading the level of protection from "D" to "C". If it is determined that respiratory protection is required, personnel shall don a full facepiece or half-mask air-purifying respirator fitted with a combination organic vapor (Black), or organic vapor-acid gas (Yellow) and HEPA (P100, Magenta) cartridge.

5.2 PPE – Level D Protection

The protective equipment to be donned by personnel working in the Exclusion Zone includes:

- Body Protection: Body protection shall include the use of "work clothing," including long pants and long- or short-sleeved shirts, and Class II ANSI approve safety vest.
- Head Protection: Non-metallic hard hats shall be worn by all personnel; ref. T8 CCR §§1514 & 3385 Head Protection.
- Hearing Protection: Hearing protection shall include the use of foam ear inserts or muffs; ref. T8 CCR §5098.
- Eye Protection: Protective eye wear (i.e., safety glasses) shall be worn by personnel working in direct proximity to operating heavy equipment and highway traffic; ref. T8 CCR §§1514 & 3385 Eye Protection.
- Hand Protection: Appropriate hand protection shall be required for employees whose work involves unusual and excessive exposure of hands to cuts capable of causing injury or impairments; ref. T8 CCR §§1514 & 3384 Hand Protection.
- Foot Protection: foot protection, such as steel toed shoes or boots shall be required for employees who are exposed to foot injuries from electrical hazards, falling objects, or crushing or penetrating actions; ref. T8 CCR §§1514 & 3385 Foot Protection.

5.3 PPE – Level "C" Protection

Level D protection may be upgraded to Level C protection by site personnel with prior notification to the SSO or Project Manager.

5.4 Miscellaneous Safety Equipment

Additional protective equipment to be available to personnel working at the site includes portable radios/walkie talkies or cell phones shall accompany all personnel.

6.0 DECONTAMINATION

The SSO will establish a work zone around each sampling location. The zone will be established to minimize the potential spread of contaminated soils.

The following decontamination (cleansing/disposal) procedures for equipment and PPE have been developed with the intent of reducing the potential for the transfer of hazardous soil from the site(s). Decontamination should be performed in direct proximity to each work area. The primary principle in consideration of decontamination procedure is: Avoid unnecessary contamination of PPE and Sampling Equipment.

6.1 Equipment Decontamination

Decontamination of soil sampling equipment shall include washing with a solution of TSP, Alconox®, or Liquinox® and water followed by a tap water rinse and a third rinse of deionized water between samples and before vacating the work area.

6.2 PPE Decontamination

The SSO will determine the necessity for and arrangement of decontamination appropriate to this project. Consumable PPE may be discarded as general refuse. Brush loose dust and soil from pants and shoes before entering vehicles.

Respirator decontamination, if required, shall include a wash with soap and water followed by a clean water rinse.

7.0 EMERGENCY RESPONSE PROCEDURES

7.1 Physical Injury

In the event of an accident resulting in physical injury, call emergency service personnel immediately and perform first aid commensurate with training and seriousness of the injury. Severely injured personnel are to be transported only by emergency service personnel and/or by ambulance personnel, unless a life-threatening condition is judged to exist that must be addressed immediately.

The Project Manager or SSO or designee will prepare a written report within 24 hours of the accident.

7.2 Catastrophic Event

In the event of a catastrophic event (e.g., severe personal injury, fire, explosion, and/or property damage), notify the fire/safety and rescue department immediately by dialing 911.

Any accident involving serious injury will require suspension of site activities until the Project Manager or SSO (or designee) has completed a review of the events and site conditions and authorized work to resume.

The Project Manager (or designee) will notify the nearest Cal/OSHA District Office immediately (within 8-hours) by phone or fax upon learning of a death or serious injury:

Foster City District Office
1065 East Hillsdale Blvd., Suite 110
Foster City, California 94404

Tel: 650.573.3812
Fax 650.573.3817

7.3 Emergency Telephone Numbers

Fire/Police/Medical Assistance:	**911**
Poison Control:	**800.876.4766**

Other phone numbers may be available or required for emergency response at specific sites. Check with onsite representatives before mobilizing to the job site.

7.4 Project Site Address

Site Location: Station Park Green, 1700 South Delaware Street, San Mateo, California

7.5 Hospital Address and Route

Hospital Reference: Sequoia Hospital
170 Alameda de las Pulgas, Redwood City, CA
650.369.5811

Directions: From the Site, ENTER Hwy 92 West to Interstate 280. SOUTH on I-280 to Edgewood Road. EAST on Edgewood Rd. to RIGHT on Alameda de las Pulgas. Arrive at the hospital (see Vicinity Map, Figure 1).

8.0 PLAN APPROVAL

The undersigned has reviewed and approved this Health and Safety Plan prepared for soil and groundwater management activities to remove and document removal of contaminated soil and groundwater during construction grading and excavation at the Station Park Green property in San Mateo, California, as described herein.

Tim Berger, PG
Project Manager

April 6, 2015
Date

The following personnel, including subcontractors involved with the project activities have reviewed, or received a copy of this Plan and Attachment A and agree to follow the health and safety procedures described herein.

37300235		Zinc yellow, as Cr (see also Sections 1532.2, 5206 & 8359)	--	0.005			
		Zirconium compounds, as Zr	--	5		--	10

S

Footnotes to Table AC-1

(a) The Chemical Abstracts Service Registry Number is a designation used to identify a specific compound or substance regardless of the naming system; these numbers were obtained from the Desk Top Analysis Tool for the Common Data Base and from the Chemical Abstracts Indexes.

(b) Refer to section 5155(d) for the significance of the Skin notation.

(c) Trade Names Removed from Table AC-1.

Trade Name		Chemical/Generic Name
Abate	see	Temephos
Ammate	see	Ammonium Sulfamate
Aqualin	see	Acrolein
Arasan	see	Thiram
Azodrin	see	Moncrotophos
Baygon	see	Propoxur
Bidrin	see	Dicrotophos
Butyl Cellosolve	see	2-Butoxyethanol
Cellosolve	see	2-Ethoxyethanol
Cellosolve Acetate	see	2-Ethoxyethyl acetate
Compound 1080	see	Sodium Fluoracetate
Coyden	see	Clopidol
Crag Herbicide	see	Sesone
Cythion	see	Malathion
Dasanit	see	Fensulfothion
Delnav	see	Dioxathion
Dibrom	see	Naled
Difolatan	see	Captafol
Disyston	see	Disulfoton
Dowtherm A	see	Phenylether and Biphenyl
Dursban	see	Chloropyrifos
Dyfonate	see	Fonofos
Fermate	see	Ferbam
Freons	see	Fluorocarbons
Furadan	see	Carbofuran
Guthion	see	Azinphos Methyl
Korlan	see	Ronnel
Lannate	see	Methomyl
Mariate	see	Methoxychlor
MLT	see	Malathion

Moxie	see	Methoxychlor
Nialate	see	Ethion
Nankor	see	Ronnel
Phosdrin	see	Mevinphos
Pival	see	Pindone
Plictran	see	Cyhexatin
Santobrite	see	Pentachlorophenol
Sevin	see	Carbaryl
Systox	see	Demeton
Teflon	see	Polytetrafluoroethylene
Thimet	see	Phorate
Thiodan	see	Endosulfan
Tordon	see	Picloram
Trolene	see	Ronnel
Vapona	see	Dichlorvos
Weedone 638	see	2, 4-D
Zoalene	see	Dinitolmide

(d) For the definition and the application of the Permissible Exposure Limit (PEL), refer to section 5155(b) and (c)(1).

(e) Parts of gas or vapor per million parts of air by volume at 25°C and 760mm Hg pressure.

(f) Milligrams of substance per cubic meter of air at 25°C and 760mm Hg pressure.

(g) Refer to section 5155(b) and (c)(3) for the significance of the Ceiling notation. A "C" notation in this column means the values given in the PEL columns are ceiling values. A numerical entry in this column represents a ceiling value in addition to the TWA values.

(h) A number of gases and vapors, when present in high concentrations, act primarily as asphyxiants without other adverse effects. A concentration limit is not included for each material because the limiting factor is the available oxygen. (Several of these materials present fire or explosion hazards.)

(i) Coal tar pitch volatiles (benzene or cyclohexane-soluble fraction) include fused polycyclic hydrocarbons (some of which are known carcinogens) which volatilize from the distillation residues of coal, petroleum (excluding asphalt), wood, and other organic matter. Asphalt (CAS 8052-42-4, and CAS 64742-93-4) is not covered under the "coal tar pitch volatiles" standard.

(j) This standard applies to the cotton waste processing operations of waste recycling (sorting, blending, cleaning, and willowing) and garnetting. It does not apply to cotton gins, cottonseed oil industry, or operations covered by section 5190.

(k) A PEL of 0.05 ppm shall apply to exposures involving a mixture of ethylene glycol dinitrate and nitroglycerin.

(l) As sampled by method that does not collect vapor.

(m) Thermal decomposition of the fluorocarbon chain in air leads to the formation of oxidized products containing carbon, fluorine and oxygen. An index of exposure to these products is possible through their alkaline hydrolysis followed by a quantitative determination of fluoride

content. No particular concentration limit is specified pending evaluation of the toxicity of the products but concentrations should be kept below the sensitivity of the analytical method.

(n) The concentration and percentage of the particulate used for this limit are determined from the fraction passing a size selector with the following characteristics:

Aerodynamic Diameter in Micrometers (unit density sphere)	*Percent Passing Selector*
0	100
1	97
2	91
3	74
4	50
5	30
6	17
7	9
8	5
10	1

(o) Refer to sections 5155(b) and (c)(2) for the definition and application of the Short Term Exposure Limit (STEL).

(p) (Reserved)

(q) Fibers per cubic centimeter of air at 25°C and 760mm Hg pressure. To be considered a fiber for this limit the glass particle must be longer than 5µm, have a length to diameter ratio of three or more, and have a diameter less than 3µm. The National Institute for Occupational Safety and Health (NIOSH), Method 7400, Issue 2, August 15, 1994, which is hereby incorporated by reference, shall be used for measuring airborne fiber concentrations.

(r) Compliance with the subtilisins PEL is assessed by sampling with a high volume sampler (600-800 liters per minute) for at least 60 minutes.

(s) The concentration and percentage of the particulate used for this limit are determined from the fraction passing a size selector with the following characteristics:

Aerodynamic Diameter in Micrometers (unit density sphere)	*Percent Passing Selector*
0	100
1	97
2	94
5	87
10	77
20	65

30	.....	58
40	.....	54.5
50	.....	52.2
100	.....	50

(t) Glutaraldehyde can cause occupational asthma and skin sensitization responses such as contact dermatitis. Exposure related symptoms may include one or more of the following: shortness of breath, chest tightness, wheeze, cough, skin rash, hives, and irritation of the nose, throat, skin or eye. Hazard communication training required by sections 5191 or 5194 shall address these health hazards and symptoms along with the measures taken by the employer to evaluate and control exposures that can include medical evaluations, exposure monitoring, ventilation systems, work practices, and personal protective equipment. The communication system required by section 3203 shall inform employees where to report possible health symptoms and where to ask questions, report concerns, and receive information about the employer's evaluation and control measures.

(u) This PEL applies to the sum of the exposures to the substance in the vapor state and from the particulate fraction specified in footnote (s) in this table.

Note: Authority cited: Section 142.3, Labor Code. Reference: Sections 142.3 and 144.6, Labor Code.

Physical Description Colorless to light-yellow liquid with an aromatic odor. [Note: A solid below 42°F.]

MW:	**BP:**	**FRZ:**	**Sol:**	**VP:**	**IP:**
78.1	176°F	42°F	0.07%	75 mmHg	9.24 eV
Sp.Gr:	**Fl.P:**	**UEL:**	**LEL:**		
0.88	12°F	7.8%	1.2%		

Class IB Flammable Liquid: Fl.P. below 73°F and BP at or above 100°F.

Incompatibilities & Reactivities Strong oxidizers, many fluorides & perchlorates, nitric acid

Exposure Routes inhalation, skin absorption, ingestion, skin and/or eye contact

Symptoms irritation eyes, skin, nose, respiratory system; dizziness; headache, nausea, staggered gait; anorexia, lassitude (weakness, exhaustion); dermatitis; bone marrow depression; [potential occupational carcinogen]

Target Organs Eyes, skin, respiratory system, blood, central nervous system, bone marrow

Cancer Site [leukemia]

Personal Protection/Sanitation (See protection codes (protect.html))
Skin: Prevent skin contact
Eyes: Prevent eye contact
Wash skin: When contaminated
Remove: When wet (flammable)
Change: No recommendation
Provide: Eyewash, Quick drench

First Aid (See procedures (firstaid.html))
Eye: Irrigate immediately
Skin: Soap wash immediately
Breathing: Respiratory support
Swallow: Medical attention immediately

Respirator Recommendations
(See Appendix E) (nengapdxe.html)

NIOSH

At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:
(APF = 10,000) Any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode
(APF = 10,000) Any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus

Escape:
(APF = 50) Any air-purifying, full-facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister
Any appropriate escape-type, self-contained breathing apparatus

Important additional information about respirator selection (pgintrod.html#mustread)

Lead compounds (as Pb)

May 1994

Immediately Dangerous to Life or Health Concentrations (IDLH)

CAS number: 7439–92–1 (Metal)

NIOSH REL: 0.100 mg/m^3 TWA

Current OSHA PEL: 0.050 mg/m^3 TWA

1989 OSHA PEL: Same as current PEL

1993-1994 ACGIH TLV: 0.15 mg/m^3 TWA

Description of substance: Varies

Original (SCP) IDLH*: 700 mg Pb/m^3 [*Note: "Effective" IDLH = 400 mg Pb/m^3 -- see discussion below.]

Basis for original (SCP) IDLH: No data on acute toxicity are available concerning the physiological effects caused by the inhalation of lead and its inorganic compounds. AIHA [1958], however, reported that the severity of the health hazard for a brief exposure is only moderate [Fairhall 1957; APHA 1943]. If the IDLH were estimated from the rat intraperitoneal LD_{LO} of 100 mg/kg for lead cyanide [NRC 1953] that was cited by NIOSH [1976], a value of 700 mg/m^3 would be chosen as the IDLH. Using these data for lead cyanide rather than other data cited by NIOSH yields the most conservative estimate of the IDLH. Because of the assigned protection factor afforded by each device, however, 2,000 ´ the OSHA PEL of 0.2 mg Pb/m^3 (i.e., 400 mg Pb/m^3) is the concentration above which only the "most protective" respirators are permitted.

Short-term exposure guidelines: None developed

ACUTE TOXICITY DATA:

Lethal dose data:

Species	**Reference**	**Route**	**LD_{50}** (mg/kg)	**LD_{Lo}** (mg/kg)	**Adjusted LD**	**Derived value**
PbODog	Flury and Zernik 1935	oral	-----	1,400	9,114 mg Pb/m^3	911 mg Pb/m^3
$PbC_4H_6O_4$Dog	Flury and Zernik 1935	oral	-----	300	1,344 mg Pb/m^3	134 mg Pb/m^3
$PbCl_2$G. pig	Budavair 1989	oral	-----	1,500	7,770 mg Pb/m^3	770 mg Pb/m^3

$Pb(NO_3)_2$G.pig	Tartler 1941	oral	-----	500	2,205 mg Pb/m3	221 mg Pb/m3
$Pb(CN)_2$Rat	NRC 1953	i.p.	-----	100	560 mg Pb/m3	56 mg Pb/m3

Human data: It has been reported that 714 mg/kg of lead acetate (i.e., about 450 mg/kg of lead) is the lethal oral dose [Takahashi 1975]. [Note: An oral dose of 450 mg Pb/kg is equivalent to a 70-kg worker being exposed to 21,000 mg Pb/m3 for 30 minutes, assuming a breathing rate of 50 liters per minute and 100% absorption.]

Revised IDLH: 100 mg Pb/m3
Basis for revised IDLH: No inhalation toxicity data are available on which to base an IDLH for lead compounds. The revised IDLH for lead compounds is 100 mg Pb/m3 based on acute oral toxicity data in humans [Takahashi 1975] and animals [Flury and Zernik 1935]. [Note: OSHA currently requires in 29 CFR 1919.1025 that workers be provided with and required to wear and use the "most protective" respirators in concentrations exceeding 100 mg Pb/m3 (i.e., 2,000 ´ the current OSHA PEL of 0.05 mg Pb/m3).]

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

FUEL OILS

CAS # 8008-20-6, 70892-10-3, 68476-30-2, 68476-34-6, 68476-31-3

This fact sheet answers the most frequently asked health questions (FAQs) about fuel oils. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. It's important you understand this information because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

SUMMARY: Fuel oils are liquid mixtures produced from petroleum, and their use mostly involves burning them as fuels. Drinking or breathing fuel oils may cause nausea or nervous system effects. However, exposure under normal use conditions is not likely to be harmful. Fuel oils have been found in at least 26 of the 1,430 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What are fuel oils?

(Pronounced fyo͞o′əl oilz)

Fuel oils are a variety of yellowish to light brown liquid mixtures that come from crude petroleum. Some chemicals found in fuel oils may evaporate easily, while others may more easily dissolve in water.

Fuel oils are produced by different petroleum refining processes, depending on their intended uses. Fuel oils may be used as fuel for engines, lamps, heaters, furnaces, and stoves, or as solvents.

Some commonly found fuel oils include kerosene, diesel fuel, jet fuel, range oil, and home heating oil. These fuel oils differ from one another by their hydrocarbon compositions, boiling point ranges, chemical additives, and uses.

What happens to fuel oils when they enter the environment?

- Some chemicals found in fuel oils may evaporate into the air from open containers or contaminated soil or water.
- Some chemicals found in fuel oils may dissolve in water after spills to surface waters or leaks from underground storage tanks.
- Some chemicals found in fuel oils may stick to particles in water, which will eventually cause them to settle to the bottom sediment.
- Some of the chemicals found in fuel oils may be broken down slowly in air, water, and soil by sunlight or small organisms.
- Some of the chemicals found in fuel oils may build up significantly in plants and animals.

How might I be exposed to fuel oils?

- Using a home kerosene heater or stove, or using fuel oils at work.
- Breathing air in home or building basements that has been contaminated with fuel oil vapors entering from the soil.
- Drinking or swimming in water that has been contaminated with fuel oils from a spill or a leaking underground storage tank.
- Touching soil contaminated with fuel oils.
- Using fuel oils to wash paint or grease from skin or equipment.

How can fuel oils affect my health?

Little information is available about the health effects that may be caused by fuel oils. People who use kerosene

stoves for cooking do not seem to have any health problems related to their exposure.

Breathing some fuel oils for short periods may cause nausea, eye irritation, increased blood pressure, headache, lightheadedness, loss of appetite, poor coordination, and difficulty concentrating. Breathing diesel fuel vapors for long periods may cause kidney damage and lower your blood's ability to clot.

Drinking small amounts of kerosene may cause vomiting, diarrhea, coughing, stomach swelling and cramps, drowsiness, restlessness, painful breathing, irritability, and unconsciousness. Drinking large amounts of kerosene may cause convulsions, coma, or death. Skin contact with kerosene for short periods may cause itchy, red, sore, or peeling skin.

How likely are fuel oils to cause cancer?

The International Agency for Research on Cancer (IARC) has determined that some fuel oils (heavy) may possibly cause cancer in humans, but for other fuel oils (light) there is not enough information to make a determination. IARC has also determined that occupational exposures to fuel oils during petroleum refining are probably carcinogenic in humans.

Some studies with mice have suggested that repeated contact with fuel oils may cause liver or skin cancer. However, other mouse studies have found this not to be the case. No studies are available in other animals or in people on the carcinogenic effects of fuel oils.

Is there a medical test to show whether I've been exposed to fuel oils?

There is no medical test that shows if you have been exposed to fuel oils. Tests are available to determine if some of the chemicals commonly found in fuel oils are in your blood. However, the presence of these chemicals in blood may not necessarily mean that you have been exposed to fuel oils.

Has the federal government made recommendations to protect human health?

The Occupational Safety and Health Administration (OSHA) and the Air Force Office of Safety and Health (AFOSH) have set a permissible exposure level (PEL) of 400 parts of petroleum distillates per million parts of air (400 ppm) for an 8-hour workday, 40-hour workweek.

The National Institute for Occupational Safety and Health (NIOSH) recommends that average workplace air levels not exceed 350 milligrams of petroleum distillates per cubic meter of air (350 mg/m^3) for a 40-hour workweek.

The Department of Transportation (DOT) lists fuel oils as hazardous materials and, therefore, regulates their transportation.

Glossary

Carcinogenic: Able to cause cancer.

CAS: Chemical Abstracts Service.

Evaporate: To change into a vapor or a gas.

Hydrocarbon: Any compound made up of hydrogen and carbon.

Milligram (mg): One thousandth of a gram.

ppm: Parts per million.

Sediment: Mud and debris that have settled to the bottom of a body of water.

AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

HYDRAULIC FLUIDS

CAS # 55957-10-3; 68937-40-6; 50815-84-4; 55962-27-1; 66594-31-8; 63848-94-2; 107028-44-4; 28777-70-0

This fact sheet answers the most frequently asked health questions (FAQs) about hydraulic fluids. For more information, call the ATSDR Information Center at 1-888-422-8737. This fact sheet is one in a series of summaries about hazardous substances and their health effects. This information is important because this substance may harm you. The effects of exposure to any hazardous substance depend on the dose, the duration, how you are exposed, personal traits and habits, and whether other chemicals are present.

HIGHLIGHTS: Exposure to hydraulic fluids occurs mainly in the workplace. Drinking certain types of hydraulic fluids can cause death in humans, and swallowing or inhaling certain types of hydraulic fluids has caused nerve damage in animals. Contact with some types of hydraulic fluids can irritate your skin or eyes. These substances have been found in at least 10 of the 1,428 National Priorities List sites identified by the Environmental Protection Agency (EPA).

What are hydraulic fluids?

(Pronounced hī-drô′lĭk flo͞o′ĭdz)

Hydraulic fluids are a large group of liquids made of many kinds of chemicals. They are used in automobile automatic transmissions, brakes, and power steering; fork lift trucks; tractors; bulldozers; industrial machinery; and airplanes. The three most common types of hydraulic fluids are mineral oil, organophosphate ester, and polyalphaolefin. Some of the trade names for hydraulic fluids include Durad®, Fyrquel®, Skydrol®, Houghton-Safe®, Pydraul®, Reofos®, Reolube®, and Quintolubric®. (Use of trade names is for identification only and does not imply endorsement by the Agency for Toxic Substances and Disease Registry, the Public Health Service, or the U.S. Department of Health and Human Services.)

Some hydraulic fluids have a bland, oily smell and others have no smell; some will burn and some will not burn. Certain hydraulic fluids are produced from crude oil and others are manufactured.

What happens to hydraulic fluids when they enter the environment?

- Hydraulic fluids can enter the environment from spills, leaks in machines that use them, or from storage areas and waste sites.
- If spilled on soil, some of the ingredients in hydraulic fluids will stay on top and others will sink into the groundwater.
- In water, some hydraulic fluids' ingredients will transfer to the bottom and can stay there for more than a year.
- Certain chemicals in hydraulic fluids may break down in air, soil, or water, but how much breaks down isn't known.
- Fish may contain some hydraulic fluids if they live in contaminated water.

How might I be exposed to hydraulic fluids?

- Touching or swallowing hydraulic fluids.
- Breathing hydraulic fluids in the air near machines where hydraulic fluids are used.
- Touching contaminated water or soil near hazardous waste sites or industrial manufacturing facilities that use or make hydraulic fluids.

How can hydraulic fluids affect my health?

Little is known about how hydraulic fluids can affect your health. Since hydraulic fluids are actually mixtures of chemicals, some of the effects seen may be caused by additives in the hydraulic fluids.

In people, the effects of breathing air with high levels of hydraulic fluids are not known. Drinking large amounts of some types of hydraulic fluids can cause pneumonia, intestinal bleeding, or death in humans. Weakness of the hands was seen in a worker who touched a lot of hydraulic fluids.

Rabbits that inhaled very high levels of one type of hydraulic fluid had trouble breathing, congested lungs, and became drowsy. The nervous systems of animals that swallowed or inhaled other hydraulic fluids were affected immediately with tremors, diarrhea, sweating, breathing difficulty, and sometimes several weeks later with weakness of the limbs, or paralysis. The immediate effects are caused because hydraulic fluids stop the action of certain enzymes, called cholinesterases, in the body. There are no reports of people swallowing or breathing the types of hydraulic fluids that cause these effects. When certain types of hydraulic fluids were put into the eyes of animals or allowed to touch the skin of people or animals for short periods of time, redness and swelling occurred. It is not known whether hydraulic fluids can cause birth defects or reproductive effects.

How likely are hydraulic fluids to cause cancer?

The Department of Health and Human Services (DHHS), the International Agency for Research on Cancer (IARC), and the EPA have not classified hydraulic fluids as to their carcinogenicity.

Is there a medical test to show whether I've been exposed to hydraulic fluids?

Hydraulic fluids can't be measured in blood, urine, or feces, but certain chemicals in the hydraulic fluids can be measured. Some of the hydraulic fluids stop the activity of certain enzymes, called cholinesterases, in blood and this activity can be measured. However, many other chemicals also cause this effect. This test isn't available at most doctors' offices, but can be done at special laboratories that have the right equipment.

Has the federal government made recommendations to protect human health?

There are no federal government recommendations to protect humans from the health effects of the major hydraulic fluids. However, mineral oil, the major chemical ingredient of one type of hydraulic fluid, is part of the petroleum distillate class of chemicals and there are regulations for these chemicals.

The Occupational Safety and Health Administration (OSHA) has set an exposure limit of 2,000 milligram per cubic meter (mg/m^3) petroleum distillates for an 8-hour workday, 40-hour workweek. The National Institute for Occupational Safety and Health (NIOSH) recommends an exposure limit of 350 mg/m^3 petroleum distillates for a 10-hour workday, 40-hour workweek.

Glossary

Additive: Substance added to another in small amounts to improve its properties.

CAS: Chemical Abstracts Service.

Carcinogenicity: Ability to cause cancer.

Petroleum Distillate: A chemical fraction of petroleum.

Subject: PROPOSAL FOR PASSIVE SOIL VAPOR SURVEY
STATION PARK GREEN PROJECT, 1700 SOUTH DELAWARE STREET
GPP SITE 119181
SAN MATEO, CALIFORNIA

Dear Mr. Mullaney:

On behalf of Essex Portfolio, L.P., a California Partnership ("Essex"), Geocon Consultants, Inc., ("Geocon") has prepared this workplan to perform a passive soil vapor survey of a portion of the property at 1700 South Delaware Street (Site) in San Mateo, California (Figure 1). This work is proposed in concert with the *Soil and Groundwater Management Plan* (SGMP), dated April 6, 2015, submitted to the San Mateo County Environmental Health System, Groundwater Protection Program ("GPP") under the Station Park Green Remedial Action Agreement ("RAA") with Essex, dated April 1, 2015.

PURPOSE AND SCOPE OF SERVICES

On March 11, 2015, Geocon sampled three piezometer wells at two installations made by Arup, the geotechnical consultant for the Station Park Green project. The wells were sampled for total dissolved solids, but an organic chemical odor was noted in the wells, and additional sampling was performed. Gasoline concentrations suggestive of a nearby source were identified in one of the piezometer samples.

In this workplan Geocon proposes to perform a passive soil vapor survey of the gasoline plume area. As depicted in the Site Plan, Figure 2, the area to be investigated is located from the south face of the former K-Mart building to the south property line, and from the west property line to the south driveway entry to the property. Twenty passive soil vapor modules are proposed to be placed in a grid pattern across this area to define the contaminant plume extents and identify the source, if within the Site. The proposed passive soil vapor sample locations are depicted on Figure 3, Passive Soil Vapor Survey Area.

A project-specific health and safety plan, included as an attachment, has been prepared for the investigation activities at the site. The plan describes standard health and safety practices to be used during field activities, and includes emergency contacts.

Task 1 – Permitting and Subsurface Utility Location

Permits for passive soil vapor sample points will be obtained, if required, from San Mateo County.

Prior to intrusive work, a private underground utility locator will locate and identify utilities in the proposed investigation areas at the Site. Once the utilities have been identified, the locations of soil vapor sampling points will be marked with white paint. Underground Service Alert (USA) will be contacted a minimum of 48 hours before field activities, as required by law.

Task 2 – Passive Soil Vapor Survey

Twenty soil gas sample locations are proposed for the project area. The passive vapor samplers will be installed beneath the asphalt concrete (AC) pavement surfaces to assess the presence of the source of petroleum hydrocarbons observed in the groundwater sample from piezometer, PZ-1. The passive soil vapor samples will be located in a grid pattern. The sample grid will be rectangular, with the short dimension (approximately 200 feet) between the former K-Mart building and the south property boundary, and the long dimension (approximately 390 feet) from the west property boundary to the east face of the former K-Mart building. From north to south, the samplers will be placed at approximate 40-foot intervals; from west to east they will be placed at approximate 75-foot intervals. Where greater resolution is desired, such as west of and upgradient of piezometer PZ-1, sample spacing may be tighter. The sample locations are depicted on Figure 3. Sample locations will maintain a distance of 7 feet from utilities, as possible, to mitigate the effects of preferential vapor flow.

Passive soil gas samples will be collected using the former GORE modules, which are currently licensed with Applied Geochemical Imaging, LLC ("AGI"). The modules are passive sorbent collection devices that are installed in a 1.5-inch-diameter hole to a depth of 2 to 3 feet. A water-tight plug is then installed at the surface. After each use, drive rods and other reusable components will be decontaminated with a three-stage wash and rinse (water plus non-phosphate detergent, tap water rinse, and distilled water rinse). Clean, disposable gloves will be worn by all field personnel when handling the modules and new and decontaminated equipment. Soil vapor module technical and analytical specifications are attached to this workplan.

The modules will be retrieved after approximately 14 days, appropriately labeled, sealed, and shipped to the AGI laboratory for chemical analysis. The holes in the concrete and asphalt will be backfilled to the surface with Portland type I-II cement. The AGI laboratory will analyze for volatile organic compounds (VOC) by thermal desorption/gas chromatography /mass selective detection (TD/GC/MS) using modified EPA Method 8260C. The analytical findings will be presented as micrograms per sample and will represent qualitative and semi-quantitative results, providing positive identification of analytes present and a numerical representation of the relative concentration per module. The analytical data will be presented in tabular and concentration gradient figure formats.

Task 3 - Reporting

Upon completion of the field investigations and receipt of the laboratory findings, Geocon will prepare a summary report. Reporting of the soil vapor survey investigation and findings will include conclusions and recommendations, pertinent figures, and the laboratory analytical report and project chain-of-custody.

Investigation Derived-Wastes

Based on the investigation area and the methods used, soil vapor module installation will not encounter hazardous or petroleum-impacted material and will not create investigation-derived waste (IDW) requiring special handling or disposal, and which may be disposed to a municipal waste receptacle. If petroleum-containing soil is encountered, the impacted soil will be contained in a 55-gallon, UN approved steel drum and labeled "Non-hazardous" for removal by licensed hauler and petroleum recycler.

We appreciate the opportunity to provide you with a work plan for this project and look forward to working with you. Please contact the undersigned if there are any questions concerning this proposal or if we may be of further service.

Sincerely,

GEOCON CONSULTANTS, INC.

SITE HEALTH AND SAFETY PLAN

I. GENERAL SITE INFORMATION

Site Name: Station Park Green

Site Address: 1700 S Delaware Street
San Mateo, CA.

Contact Person: Tim Berger Phone: (916) 852-9118

Site Identification Number: APN 16332006

Proposed date(s) of Site Work: April 2015

II. DESCRIPTION OF INSPECTION ACTIVITY

Purpose of Activity:

- ☐ Monitoring well installation
- ☐ Gas extraction well installation
- ☐ Domestic well installation
- ☐ Agricultural well installation
- ☐ Geotechnical Investigation (soil borings, CPT)
- ☒ Other (specifiy): Passive Soil Vapor Survey

Type of Site:

- ☐ Industrial
- ☐ Gas station
- ☐ Landfill
- ☐ Agricultural
- ☐ Vacant urban/suburban
- ☒ Other (specifiy): Commercial

Provide a brief description of the proposed activities: Installation and retrieval of 20 passive soil vapor modules in asphalt parking lot.

Investigation-derived material disposal:

Soil: spoils placed in containers for disposition by sub-consultant if impacted.

Water: not applicable

Other: not applicable

III. POTENTIAL HEALTH AND SAFETY HAZARDS

Anticipated physical hazards. Check all that apply.

- ☐ heat (high ambient temps)
- ☐ cold
- ☒ noise
- ☐ oxygen depletion
- ☐ asphyxiation

- ☐ Excavation
  - ☐ cave-ins
  - ☐ fall, trips, slipping

- ☐ Heavy equipment
- ☒ physical injury/trauma from moving machinery
- ☐ electrical hazards
- ☐ General Construction
- ☐ physical injury and trauma

- ☐ Other (specify):

HAZARD EVALUATION

Parameter	TLV (ppm)	IDLH (ppm)	LEL (%) skin eyes	Health
Petroleum in soil	None	None	None	Low

SPECIAL PRECAUTIONS: Screen with PID, handle wearing nitrile gloves

IV. PERSONAL PROTECTIVE EQUIPMENT. CHECK ALL APPLICABLE ITEMS

Minimum personal protective equipment:

☒ hardhat
☐ safety glasses / goggles
☐ steel-toed / shank shoes or boots
☒ clothing protection / safety vest
☐ hearing protection
☐ other (specify):

Personal protection: not applicable

Level of protection: ☐ A ☐ B ☐ C ☒ D

Modifications: none

Surveillance equipment and materials: none

Instrument	Action Level
n/a	n/a

First Aid: First Aid kit available onsite, if necessary

TEAM COMPOSITION:

Team Member	Responsibility
TBD	Installation & overall site coordination

AGI Environmental Services "snapshot"

AGI Environmental Service Options

Screening	Concentration	DoD ELAP
- Type 1 Sampler	- Type 8 Sampler	- Type 8 Sampler
- AGI Screening method*	- AGI Screening method*	- US EPA 8260C method** (modified)
- Results as mass (µg)	- Results as mass (µg) and concentrations (µg/m^3; µg/L)	- Results as mass (µg) and concentrations (µg/m^3; µg/L)
- Applicable compounds	- Applicable compounds	- Applicable compounds

Note: Target compounds associated with each Service Option are provided on page 4.

*US EPA 8260 modified for external standard calibration
**US EPA 8260C accredited by A2LA for meeting requirements of ISO17025, US DoD ELAP, and TNI.

AGI Universal Passive Sampler Capabilities

Type 1
- No measured uptake rates
- Volatility range C_2 to C_{20}
- Vinyl chloride, 11DCE are reported

Type 8
- Measured uptake rates
- Volatility range C_4 to C_{20}
- Vinyl chloride, 11DCE **cannot** be reported

1) Select the AGI Environmental Service Option and number of samplers to meet your project objectives.
2) AGI samplers are shipped to you for deployment and retrieval.
3) AGI samplers are returned to AGI's laboratory in Newark, Delaware, USA for analysis.
4) An AGI Laboratory Report is issued.
5) For soil gas surveys of 10 or more AGI field samplers, contour maps are prepared, and an AGI Mapping Report is issued.

- The service cost includes the AGI Universal Passive Samplers, sampler analysis, reports with data tables and contour maps (as needed), and shipping to you (some restrictions apply).
- A quotation can be prepared by completing the interactive questionnaire located on page 9.
- Additional detailed service information is contained in the following pages.

AGI Analytical Methods

1) **AGI Screening Method**[1][2]
   a. Thermal desorption GC/MS
   b. External standard calibration
   c. Second source calibration checks/ reference standards
   d. Method blanks, BFB tune checks

2) **US EPA 8260C Method**[3]**(modified; extended QC; accredited by A2LA)**
   a. Thermal desorption GC/MS
   b. Internal standard calibration with surrogate spikes
   c. BFB MS Tune checks, method blanks, LCS/ LCSD samples
   d. Method has ISO 17025 DoD ELAP accreditation[3]
   e. EPA 8260C QC criteria

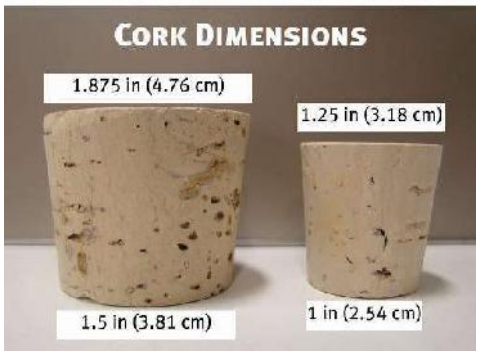
ACCREDITED
Testing Cert. #3062.01

[1]Method not listed on AGI's scope of accreditation
[2]Type 8 sampler is required for concentration reporting. Mass data only for compounds not having measured or estimated sampling rates
[3]Method listed on AGI's scope of accreditation for compounds listed

All Service Options Include:

- Survey design, pre- and post-survey consultation (as needed)
- AGI Universal Passive Samplers, trip blanks, outbound shipping(some restrictions apply)
- Chain of Custody and Installation/Retrieval e-Log
- Analysis, electronic data deliverable (EDD)[4], Laboratory Report[4]
- Soil gas contour maps[4] (up to five) and a Mapping Report[4] for projects having at least 10 AGI field samplers[5]
- Data, reports, and maps provided electronically via secure ftp site
- Corks (small, default, see photo at right) – as applicable
- String, insertion rod, weights (for groundwater sampling) - as applicable

[4]Standard EDD format; CSV for data tables, PDF for contour maps and reports. Other formats may be available upon request and may incur additional cost.
[5]For projects with <10 samplers, a fee is charged to provide contour maps and Mapping Report.



Turn around time (TAT):

- TAT is a function of the number of samplers and the current laboratory capacity. Normal TAT is approximately 10-12 working days (≤ 50 samplers). TAT increases by two days for every additional 50 samplers.

Not included:

- Sampler field installation and retrieval costs
- Return shipping costs
- Taxes, duties, or VAT

Terms:

- Project-specific pricing, quotation valid for 90 days
- Paid in full 30 days from invoice date
- Credit approval required
- Soil gas surveys may be subject to a minimum order fee

Additional Analyte Groups

- Compounds below are not included on AGI's scope of accreditation
- Can be added to any of the three service options
- Additional fee per AGI Universal Sampler per group
- Single point calibration, mass (µg) data

Explosive Breakdown	PCBs	Chemical Agent Breakdown	Pesticides
Nitrobenzene	Monochlorobiphenyl	1,4-Dithiane	Alpha BHC
2-Nitrotoluene	Dichlorobiphenyl	1,4-Oxathiane	Beta BHC
3-Nitrotoluene	Trichlorobiphenyl	Thiodiglycol	Gama BHC
4-Nitrotoluene	Tetrachlorobiphenyl	Benzothiazole	Delta BHC
1,3-Dinitrotoluene	Pentachlorobiphenyl	Dimethyl disulfide	Heptachlor
2,6-Dinitrotoluene		2-Chloroacetophenone	Aldrin
2,4-Dinitrotoluene	**PAHs**	4-Chloroacetophenone	Heptachlor epoxide
1,3,5-Trinitrobenzene	Phenanthrene	p-Chlorophenyl methyl sulfide	Endosulfan I
2,4,6-Trinitrotoluene	Anthracene	p-Chlorophenyl methyl sulfone	4,4' DDE
	Fluoranthene	p-Chlorophenyl methyl sulfoxide	Dieldrin
	Pyrene	Diisopropyl methylphosphonate (DIMP)	Endrin
		Dimethyl methylphosphonate (DMMP)	4,4'-DDD
			Endosulfan II
			Endrin Aldehyde
			4,4' DDT
			Endosulfan Sulfate
			Endrin Ketone
			Methoxychlor

Additional non-standard target compounds for which detection and reporting capabilities have been confirmed.

Additional charges apply; mass (µg) data

1,2,3-Trichlorobenzene	3-Methylphenol	Dibromochloromethane	o-Toluidine
1,2,3-Trichloropropane	4,4-Dichlorobenzophenone	Dichlorodifluoromethane (F12-FN)	Phenol
1,2,4-Trichlorobenzene	4-Aminobiphenyl	Dichlorodifluoromethane (F-12)	Styrene
1,2-Dibromo-3-Chloropropane	4-Chloroaniline	Dichlorofluoromethane (F-21)	Tetrachloro difluoroethane (F-112)
1,2-Dibromoethane (EDB)	4-Isopropytoluene	Dichlorotetrafluoroethane (F-114)	Trichlorofluoromethane (F-11)
1,2-Dichloropropane	4-Methyphenol	Dicyclopentadiene	Trichloro trifluoroethane (F-113)
1,4-Dioxane	Acetone	Freon 123	Trifluoromethane (F-23)
2,2,4-Trimethylpentane	Aniline	Freon 123A	
2,2-Dichloropropane	Bromodichloromethane	Hexachlorobutadiene	
2,3,4,5-Tetrachlorophenol	Bromoform	Hexane	
2,3,4,6-Tetrachlorophenol	Carbon Tetrafluoride (F-14)	2-Hexanone	
2,3,5,6-Tetrachorophenol	Chlorobenzene	Methyl Ethyl Ketone	
2,4-Dichlorobenzophenone	Chlorodifluoromethane (F-22-FN)	Methyl Isobutyl Ketone	
2,4-Dimethylphenol	Chlorodifluoromethane (F-22)	Methylene Chloride	
2-Chlorotoluene	Chlorotrifluoromethane (F-13)	Nitrobenzene	

Copyright © 2014 Amplified Geochemical Imaging, LLC.

AdditionalServices (fees may apply)

- Single compound reporting (e.g., PCE only)
- Reporting a subset of the listed target compounds
- QA deliverables

  BFB tune reports, calibration data, individual quantitation reports (samples and QC) with mass spectral comparisons to reference spectra (samples and blanks)
- Expedited analytical results
  - ≤ 50 AGI Universal Samplers, five working day TAT, starting from the day after sampler receipt
    - For example: Samplers are received on a Tuesday, the Laboratory Report will be issued no later than the following Tuesday.
    - For weeks that do not include US holidays or closure due to inclement weather
- Supplemental services – billed at an hourly rate, two hour minimum
- **Non-standard target compounds (fees apply)**
  - Can be added to any of the three service options, mass (µg) data only
  - Up to five compounds by single point calibration (Dependent on availability of standards and method applicability)
  - Up to ten compounds, library search, estimated masses >0.1µg

Other Information

- AGI Universal Passive Samplers returned unused cannot be placed back into inventory. A per-sampler fee is assessed for samplers not returned, returned unused, lost or damaged.
- Please use samplers within three months of sampler receipt.
- To ensure accuracy and applicability of sample results, please do not retain samplers or transfer them to other projects without discussion with, and approval by AGI.

AGI strives to present an accurate, cost-saving quotation for services. To help us ensure its accuracy, please take a moment and provide information for the following.

Complete form and email file to:
shaw@agisurveys.net; whetzel@agisurveys.net; hodny@agisurveys.net; dudley@agisurveys.net

Date quote is needed:

Anticipated field sampling start date

Address for sampler shipment (street address, city, state, zip code, country):

Address for invoicing (street address, city, state, zip code, country):

Project objective: *Indicate if the AGI Environmental Survey in support of site assessment, source identification, vapor intrusion, plume delineation, groundwater sampling, etc.*

Project reference: *Name of site or project for referencing on project related correspondence and reporting.*

Project city and state:

Project country:

Service option: ☐ Screening ☐ Concentration ☐ US DoD

Media sampled: ☐ Air ☐ Soil Gas ☐ Ground water ☐ Sediment porewater ☐ Other _____

☐ **Enter AGI Universal Sampler count[1] for field deployment**

☐ **Enter Field duplicate count *(additional samplers to be collocated with another sampler)***

☐ **Enter Laboratory duplicate count[2] *(analysis of second set of adsorbents)***

☐ **Enter Cork** size and count:** Small, 1.0 inch*

☐ **Enter Cork** size and count:** Large 1.5 inch*

1 - AGI adds an appropriate number of samplers as trip blanks at no additional cost
2 – Client specifies which samplers will have the duplicate adsorbent analyzed, to be noted on the Installation and Retrieval e-Log
* - Diameter of narrow end of tapered cork
** - We are striving to reduce waste by sending only the cork sizes and counts required. If the cork size is unknown presently, we will ask at the time the order is placed, or ship small corks (default choice).

Re: Essex Property Trust, Inc. Station Park Green Project -- 1700 South Delaware Street, San Mateo, California

Dear Mr. Fitzpatrick:

Our firm represents Essex Property Trust, Inc. and its affiliates (collectively, "Essex") with respect to the above-referenced property (the "subject property") which is located immediately west of a portion of the Caltrain Corridor (the "Caltrain Parcel"). The purpose of this letter is to put SamTrans and the Peninsula Corridor Joint Powers Board ("JPB") on formal notice that:

(a) Environmental investigation conducted on behalf of Essex on the subject property has identified impacts to soil and groundwater along the western border of the subject property;

(b) The impacts detected, which involve primarily benzene and other gasoline constituents, appear attributable to prior use and occupancy of a portion of the Caltrain Corridor owned and operated by the JPB and utilized by SamTrans;

(c) Essex requests that SamTrans and/or the JPB initiate and diligently pursue additional investigation and appropriate response action to address those impacts associated with the Caltrain Corridor parcel adjoining the subject property so as to not delay or burden Essex's plans for development of the subject property; and

(d) To the extent those impacts will result in additional costs to Essex in connection with its development of the subject property, it intends to and will look to SamTrans and/or the JPB for cost recovery.

We understand you have been previously been advised verbally by an Essex representative as to the impacts identified. Attached is a copy of the most recent soil gas report prepared by Essex'

consultant which documents an off-site source has impacted soils in a portion of the subject property adjoining the Caltrain Corridor. On that basis, our client has directed that we provide this formal written notice and demand in order to enable you to take measures necessary to address the situation and assure Essex of SamTrans' intent to cooperate.

Essex is prepared to move forward with its grading and excavation plans, including any soil remediation or soil management work required as a consequence of the off-site impacts. As such, time is of the essence here. Under the circumstances, a cooperative, joint approach to investigation and potential remedial action appears most advantageous to both sides here. Assuming you agree, I encourage you to reach out to my client at your earliest opportunity.

In the meantime, please let me know if Essex is required to submit a formal notice of claim to SamTrans or the JPB to formally initiate the claims process and address any questions or requests for additional information regarding this matter to our firm.

Regards,

John J. Allen

Subject: Hayward Park Station Parking Lot
Attachments: EDR_SanbornMap_3787952 3S_111813 (002).pdf; Historic Fill topos aerials.pdf

Gary,

Per our conversation earlier today we have concerns that the contamination that Essex (1700 S Delaware, San Mateo) has removed from their adjoining parcel appears to extend or originate from the Caltrain parking lot. All of the current data is uploaded to Geotracker in several reports. The site is listed as Station Park Green (Geotracker ID T10000006956). I have attached some Sanborn Maps that show a company named LC Smith operated the plant. The plant appears to be mostly on the Caltrain Parking parcel. I have been informed that LC Smith was dissolved in the 1970's. We will likely be sending out opening site letters this month and we want to have all the information we can prior to that letter. Thank you.

Gary,

We have let this project sit for a little while. All of the data we have is in Geotracker for Station Park Green. We still think there is enough data to open a site (we already have). It is time to get together and talk about moving this site forward. Let me know when you have some time. Thanks.

Marc,

The following para. is from Versar's Phase I ESA of the SPG property prepared on behalf of Essex. The SLIC listing refers to the entire corridor, and we did not find specific references supporting the SLIC listing.

"The Caltrain Corridor (San Francisco to Santa Clara) is listed in the SLIC database and adjoins portions of the Site. The Caltrain corridor is reported to contain TPH and metals in soil with the case beginning in October 2001 and case closure on December 3, 2003. TPH in groundwater is likely to occur within the corridor, and has been historically demonstrated at the Site. The Caltrain corridor adjoins portions of the Site and is within the American Society for Testing Materials (ASTM) Critical Distance of the Site. Based on the facility being within the critical distance of the Site with similar impacts that have been identified at the Site, the Caltrain corridor presents a pVEC to the Site."

Regarding data indicative of contamination beneath the Caltrain corridor, my recollection is that pertains to two Vail-related wells proximal to the western boundary of the corridor that contain VOCs, as also described in the Phase I.

"Vail Burner & Oil (1741 Leslie), is located approximately 250 feet west and up gradient to the Site, beyond the adjoining Cal Train station and rail right-of-way, and has the potential to impact the Site. This facility has an open LUST case involving a release of diesel to soil and groundwater. A review of a groundwater monitoring report indicated that the monitoring wells closest to the Site are impacted by TPH-diesel and CVOC. The TPH-d and Chlorinated Volatile Organic Compound (CVOC) impacts from this facility have not been defined to the east (towards the Site) and as such, this facility represents an off-Site REC and pVEC to the Site."

Given what we found on the SPG property in the western area with respect to heavy-weight TPH, at or close to free-product levels in some locations, it seems reasonable to assume that similar conditions exist within the Caltrain property where the same or similar historical features and uses were located. It is unfortunate that contamination of the abandoned storm drain line bounding the CalTrain and SPG properties has clouded and possibly concealed evidence of contaminants occurring along and/or migrating across the boundary from the Caltrain side.

- Tim

Subject: Re: Regarding location of Station Park Green Boring B12

Thanks. It helps some. The other question I have is that the Versar report indicates knowledge of a spill on Caltrain tracks and implies that there was data to show contamination on/under the parking lot area. This should be in addition to the historical UST location of Vail Burner on the west side of the tracks?? Thanks.

Subject: Regarding location of Station Park Green Boring B12

Marc,

After reviewing figures prepared by Versar and Geocon showing the B12 location, I believe the location of boring B12 is relatively accurate in both sets of figures, representative versions of which are attached. The appearance of a difference may be attributed to two features of the Versar Phase II ESA figure, in which the yellow property boundary line appears to be drawn somewhat east of the actual boundary, which is better depicted on the Versar Supplemental Phase II ESA figure and the attached Geocon figure. Second, the icon representing the location of boring B12 appears to be larger on the initial Versar figure, therefore less precisely located than subsequent figures.

Additionally, review of the boring log for B3 of the Boundary TPH investigation indicates the boring intersected the stormdrain line that was found to be contaminated during Site grading and cleanup in that area. The boring log for B12, though a hydropunch and lacks soil observational detail, also suggests proximity to a shallow saturated horizon (see also the comments at the bottom of the log). This suggests that the two borings are relatively near one another.

I hope this information is helpful to you.

Sincerely,

Tim Berger, PG, CEG, HG | *Senior Geologist*

Stephen Chao
Peninsula Corridor Joint Powers Board (PCJPB)
1250 San Carlos Avenue
San Carlos, CA 94070

SUBJECT: PETROLEUM ADJACENT TO NORTHEAST SIDE OF HAYWARD PARK CALTRAIN STATION PARKING LOT, SAN MATEO, CALIFORNIA

Dear Mr. Chao:

The San Mateo County Groundwater Protection Program (GPP) staff email dated January 20, 2016, notified Gary Cardona of your office that petroleum contamination was encountered during the redevelopment of the property at 1700 South Delaware Street and that the contamination appeared to originate from the parking lot of the Hayward Park CalTrain station (this parking lot was formerly occupied by an asphalt plant). Our email dated September 20, 2016, requested a meeting and Mr. Cordona replied he was going to refer the matter to your attention. No work has been reported to our office since that date.

Our concern is up to 4,100 mg/kg of total petroleum hydrocarbons as diesel (TPHd) and 31,000 mg/kg of TPH as motor oil (TPHmo) were reported in soil samples collected from Boring 30 and RE-3 and these locations were adjacent to the former asphalt plant (refer to attached figures). These TPH concentrations exceed Environmental Screening Levels established by the Regional Water Quality Control Board (RWQCB), are indicative of free product, and no evidence has been submitted to demonstrate the extent, stability, and impact of this contamination on human health and environment has been assessed. Therefore, GPP staff opened an environmental oversight case under our voluntary cleanup program in accordance with California Health and Safety Code (CH&SC) Sections 101480 and 25260.

GPP staff have identified PCJPB as a potential responsible party (PRP) for the contamination by virtue of property ownership. However, GPP staff reserve the right to modify the identification of PRPs should additional information supporting the change become available, such as the identification of other property owners and people who operated the asphalt facility. Please contact Gregory J. Smith, Water Protection Programs Supervisor, at (650) 372-6279 to appeal our decision designating PCJPB as a PRP if specific information can be provided demonstrating PCJPB does not meet the definition of a responsible party. Please note, PRPs may or may not have signed civil contracts, such as a property

sales agreement, requiring other parties to perform any or all environmental investigation and remedial actions required by government agencies; however, the responsible party is ultimately responsible for complying with all government agency requests under the CH&SC and Water Code.

This site was opened under San Mateo County's Voluntary Cleanup Program because the source of the contamination does not appear to be an identifiable underground storage tank. Voluntary cleanup sites require the PRPs to reimburse the lead government agency for oversight time. The current GPP staff billing rate is $198 per hour. GPP staff will mail to your attention under separate cover a Remedial Action Agreement (RAA) detailing our oversight and your responsibilities under our voluntary cleanup program, including the billing of our oversight time. Your signature on the RAA acknowledges an understanding and acceptance of these responsibilities.

GPP staff are willing to oversee the investigation and potential cleanup of the contamination. However, the RWQCB and Department of Toxic Substances Control (DTSC) will be notified and may elect to become the lead oversight agency. If you do not sign the RAA and no other party volunteers to execute a RAA with our office, then we will transfer the case to the RWQCB or DTSC or, if applicable, transfer the case in our mandatory Unified Program Agency program. Even if you sign the RAA, you can always request the RWQCB or DTSC to become the lead oversight agency through the Brownfields Memorandum of Agreement or State Site Designation process by contacting Ron Goloubow of the RWQCB at 510-622-2442 (Brownfields Memorandum of Agreement process) or Laurie Grouard of the DTSC at 916-323-3394 (Site Designation process).

GPP staff would like to meet with you and your representatives to detail our oversight and your responsibilities under our voluntary cleanup program and to answer any questions regarding this process. Please provide me by **May 24, 2018,** the dates and times you are available to meet and the contact information of the participants. I will inform you of the date and time of the meeting once I receive this information. Please contact me at (650) 372-6292 or at dmilano@smcgov.org if you have any questions.

Sincerely,

Deno G. Milano, PG

Subject: Hayward Park CalTrain Station

Importance: High

Hi Stephen. On 6/19/18 you left me a voice mail message indicating you are still working on getting me an additional assessment report from the developer that our agency may not have. We have not received the report. More importantly, the PCJPB has not signed and returned to us the remedial action agreement (RAA) we mailed to you on 4/18/18. Please note, if we do not received a signed copy of the RAA by 7/31/18, then we'll have to refer this case to the RWQCB and DTSC.

I have uploaded all pertinent correspondence and reports to GeoTracker. The site is listed under the address of 0 Concar Drive, San Mateo.

SUBJECT: PETROLEUM ADJACENT TO NORTHEAST SIDE OF HAYWARD PARK CALTRAIN STATION PARKING LOT, SAN MATEO, CALIFORNIA

Dear Mr. Chao:

You left me a voice mail message on June 19, 2018, indicating the PCJPB is still working on providing me additional report(s) on the assessment work performed by the developer adjacent to the subject site. San Mateo County Groundwater Protection Program staff have not received any additional information since that date. Therefore, please upload to GeoTracker by **December 21, 2018**, a work plan detailing and justifying a scope of work to assess the lateral and vertical extent of the contamination at the subject site. Any data received from the developer in the interim can be incorporated into the work plan to potentially reduce the scope of work.

Please contact me at 650-372-6292 (direct), 650-372-6200 (main), or at dmilano@smcgov.org if you have any questions. I'm available Monday through Thursday, excluding holidays.

Sincerely,

RECORD OF TELEPHONE CONVERSATION

DATE: 12/19/18 (~3PM)

CASE: Hayward Park CalTrain Station, San Mateo (Case #119191 / RO2243)

BETWEEN: Stephen Chao (RP's representative) and Deno Milano (GPP)

RE: GPP Work Plan Request

Stephen said he is unable to submit the required work plan by deadline tomorrow. GPP did not consider an extension warranted because the project file indicates CalTrain has had sufficient time to prepare the work plan. GPP reminded Stephen that we first brought this issue to CalTrain's attention in January 2016. Stephen felt the contamination originated from offsite sources, but he has not provided any information to GPP staff. GPP stated that if the RP does not consider the work required by GPP staff necessary, then the RP must justify why this is the case within 30 days of receiving our directive letter to perform the work.

Note – Stephen has informed GPP staff since at least 5/2/18 that CalTrain is aware of additional assessment information they are trying to obtain. However, nothing has been reported to GPP staff. GPP suggested we be made aware of what the additional data is because if it involved drilling below approximately 5 feet below grade, then the person doing the work would have had to obtain a drilling permit from us and the permit requires that person to submit the results of the investigation to us.

(via chaos@samtrans.com)

SUBJECT: PETROLEUM CONTAMINATION BENEATH PARKING LOT OF CALTRAIN HAYWARD PARK STATION, 401 CONCAR DRIVE, SAN MATEO, CALIFORNIA

Dear Mr. Chao:

ERM uploaded to the State GeoTracker database a work plan for additional assessment dated January 4, 2018 (sic). The following comments are based on San Mateo County Groundwater Protection Program (GPP) staff review of the work plan and the project file.

The work plan contains hereto unreported soil and groundwater sampling results from a May 2016 investigation performed at the subject site. GPP staff cannot fully evaluate the value of these results because many soil samples were not analyzed from the depth of previously identified significant TPH impact (approximately 5, 9, and 12 feet below grade [fbg]) and the boring logs and details of groundwater sample collection were not provided. Therefore, the isoconcentration maps provided in Attachment 1 may not provide an accurate portrayal of site conditions. Please note, Conditions E and F of Permit 16-0793 issued for the May 2016 sampling required the permittee to submit to us the analytical results, boring logs, and site plans within 60 days of the sampling.

The work plan indicates the Peninsula Corridor Joint Powers Board (PCJPB) plans to redevelop the subject site into a mixed commercial residential property with subterranean parking, and therefore, only proposes at this time to determine if the contamination extends offsite. GPP staff need to know the location and use of the planned redevelopment structures and the proposed depth of the proposed subterranean parking garage to estimate if redevelopment will likely remove the lateral and vertical extent of onsite contamination. Unless the parking garage will extend across the entire site, the limited TPH soil sampling data from 5, 9, and 12 fbg makes it difficult to estimate the lateral extent of onsite TPH impact. It also appears the parking garage would have to extend to approximately 15 fbg to remove the vertical extent of contamination based on the soil sampling results from B-30. However, this is only an estimate because only a few soil samples have been collected below 12 fbg.

GPP staff would consider postponing onsite remediation until site redevelopment occurs if the contamination is not migrating or posing a current risk to human health or the environment. However, we would only support a finite postponement because planned redevelopment projects are not always implemented. Therefore, please upload to GeoTracker by **April 11, 2019**, a letter indicating the year of planned re-development and, if known, the location and use of the planned structures and the depth of the proposed subterranean parking garage.

GPP staff approve the work plan with the following conditions:

- Base the selection of soil samples for analysis on sample screening (visual and photoionization detector), the depth to groundwater, stratigraphy, the depth of previously identified impacts, and the need to also assess the vertical extent of contamination (e.g. analyzing a soil sample from the contact between a sand and an underlying clay where potential surface spills from the asphalt batch plant may have accumulated and additionally analyzing soil samples from 5, 9, and 12 fbg to assess the lateral extent of contamination). Ensure a sufficient number of samples are analyzed to demonstrate the lateral and vertical extent of the contamination is assessed (i.e. do not limit drilling depth or the number of samples analyzed to a preset value or simply analyze soil samples at 5-foot-intervals);

- Consider drilling additional borings to assess the onsite data gaps we previously identified in the May 2016 assessment work (i.e. lack of soil samples from 5,9, and 12 fbg and the lack of vertical assessment in some areas such as W-14);

- Consider drilling additional borings west of W-12 and W-14 to assess if petroleum contamination from the Vail Oil and Burner site west of W-13 (SMCo # 110049 at 1741 Leslie Street) is migrating onto the subject site. Impacted groundwater migrating onto the subject site or impinging against the subsurface portion of planned structures could pose potential vapor intrusion and groundwater disposal concerns. Please also verify the location of the former asphalt mixing plant shown on Figure 2 using the 1961 Sanborn Map and whether the petroleum concentrations reported in W-6 and Station Green sampling localities RE3 and B-30 (approximately between W-8 and W-10) represent separate source areas;

- Ensure borings drilled to sample first groundwater are not driven too deep into the saturated zone. A maximum drilling depth of 8 fbg appears appropriate for sampling first groundwater based on the 3 to 6 fbg depth to groundwater reported in the former groundwater monitoring wells at the Vail Oil and Burner site. The proposed use of a direct-push drilling rig in fine-grained soils could make it difficult to detect groundwater and significantly lengthen the time for groundwater to accumulate in the borehole. Therefore, please protect the borings from surface runoff until groundwater samples can be collected;

- Also analyze the soil samples for naphthalene and additionally analyze the soil samples containing elevated TPH-oil concentrations for semi-volatile organic compounds. Any analysis performed with a silica gel cleanup must also be performed without the cleanup

per Regional Water Quality Control Board requirements. It also may be prudent to evaluate the chromatograms of current and former diesel analysis to determine if the diesel results appear to represent diesel or oil/asphalt;

- Backfill the borings containing groundwater by pumping Portland cement grout through a tremie pipe extending to the bottom of the boring until the groundwater in the boring is displaced out of the boring (pouring grout into a funnel placed on top of the tremie pipe is not acceptable unless the boring is dry and <30-feet-deep). Mix the grout at a ratio of 94 pounds of Portland cement to 6 to 7 gallons of water; and

- Upload to GeoTracker by **June 10, 2019**, all electronic files required by California Code of Regulations Title 23, Division 3, Chapter 30, including a report detailing and justifying the methods, findings, conclusions, and recommendations of the investigation.

The report must indicate how investigative derived wastes were disposed offsite and include scaled figures (base-10 preferred) and data analytical tables sufficient to support conclusions regarding contaminant extent, stability, and risk. Please include at least one figure identifying all sampling locations to date and tables summarizing the laboratory results of all soil, groundwater, and vapor sampling analyses performed to date (one table for soil, one for groundwater, and one for vapor is preferred). Each table should include the date and depth of sample collection, as appropriate, and the proper field point name (FPN). FPNs must be consistent between text, figures, tables, and boring logs.

Closing Comments

The May 2016 soil sampling results from W-16 and W-17 suggest lead is also a concern in the southeast portion of the subject site. The soil and groundwater management plan we will require and approve prior to site redevelopment will have to also address the lead contamination.

The TPH-g reported in the groundwater sample collected from Boring B12 near the property line between the Station Green and PCJPB parcels is a potential concern and does not appear likely to have originated from the former Shell station approximately 600 feet northeast. Although the TPHg results from the analysis of the groundwater samples collected from W-21 and B-31 through B-33 were below acceptable laboratory reporting limits, GPP staff cannot evaluate the usefulness of these results because the boring logs and groundwater sampling details for Borings W-21, B-3, and B-12 have not been submitted to GPP staff. For example, if the groundwater results from Boring B-12 are representative of first groundwater (unknown at this time), then the 20 to 30 fbg sampling depth in B-31 through B-33 was too deep to assess the lateral extent of the TPH impact in B-12 unless the sample from B-12 was collected from the same sampling interval. GPP staff will require the property owner, boring owner, and consultant for the Station Green site to submit the analytical results, boring logs, and site plan for Borings B-1 through B-17.

Please contact me at 650-372-6292 (direct), 650-372-6200 (main), or at dmilano@smcgov.org if you have any questions. I'm available Monday through Thursday, excluding holidays.

Sincerely,

1.0 INTRODUCTION

This *Site Assessment Report* ("*Report*") has been prepared by West Environmental Services & Technology, Inc., (WEST) on behalf of the Peninsula Corridor Joint Powers Board (PCJPB) for the Hayward Park Caltrain Station property located at 401 Concar Drive in San Mateo, California. This Report presents a summary of: Site and surrounding property histories; subsurface investigations conducted by WEST during May 2016; and a comparison of Site data with applicable screening levels.

1.1 BACKGROUND

The Site is located on a triangular portion of land that is currently used as the Hayward Park Caltrain station with associated parking areas. L.C. Smith Company Asphalt Plant was historically located on the Site and the eastern portion of the adjacent property located at 1700 South Delware Street. In 2018, the PCJPB approved development of the Hayward Park Caltrain Station into a mixed commercial-residential property with subterranean parking.

The adjacent property at 1700 South Delware Street has been redeveloped for mixed-use commercial and residential use as part of the Station Park Green Project, with San Mateo County Environmental Health Services Division (SMCEH) as the lead agency for oversight (Case No. 119181). Laboratory analysis of soil and groundwater samples collected during pre-development sampling at the Station Park Green Project border with the Site revealed total petroleum hydrocarbons (TPH), including diesel (TPHd) up to: 4,100 milligrams per kilogram (mg/kg) in soil (B-30); and 120,000 micrograms per liter (µg/l) in groundwater (B-12). Laboratory analysis of samples revealed TPH in the motor oil range (TPHmo) up to 30,000 mg/kg in soil (B-30) and 8,700 µg/l (B-12) in groundwater; and TPH in the gasoline range (TPHg) up to 340 mg/kg in soil (B-30) and 19,000 µg/l (B-12) in groundwater.

On January 20, 2016 SMCEH emailed PJPB with a concern that contamination removed from soil at the Station Park Green Project boundary with the Site "appeared to extend or originate

from the Caltrain parking lot" and that L.C. Smith operated an asphalt plant predominantly on the Site until the 1970s (SMCEH, 2016).

In May 2016, WEST advanced 24 borings at the Site at the request of a third-party entity considering redevelopment of the Site. The sampling data from the May 2016 investigation revealed the presence of TPHd in: soil up to 14,700 mg/kg; and groundwater up to 11,700 µg/l (W-12). The investigation also revealed: the presence of lead in soil up to 2,610 mg/kg; and pesticides and semi-volatile organic compounds in soil. Details of the May 2016 investigation are presented in Section 3.0 of this *Report*.

On April 18, 2018, the SMCEH opened environmental oversight Case File 119191 under its Voluntary Cleanup Program for the Site to address the presence of diesel and motor oil. On October 16, 2018, SMCEH requested a scope-of-work to define the lateral and vertical extent of contamination at the Site. On behalf of the JPB, ERM of Walnut Creek, California submitted its *Work Plan* for subsurface investigations of the Site on January 4, 2018 (ERM, 2018). The *Work Plan* presented a summary of the WEST 2016 data and proposed advancing eight additional soil borings at the Site for collection of soil and groundwater samples for analysis of TPH as gasoline (TPHg), TPHd, TPHmo and the petroleum related volatile organic compounds, benzene, toluene, ethyl benzene and xylenes (ERM, 2018).

This *Report* presents a summary of WEST's 2016 subsurface investigation and comparison with applicable environmental screening levels.

2.0 SITE DESCRIPTION

The approximately 2.81-acre Site is located at 401 Concar Drive in San Mateo, California with assessors parcel number 035200998. The Site is relatively flat at approximately 8-feet above mean sea level (MSL) with a gently slope toward San Francisco Bay to the east. The Site is currently used for the Hayward Park Caltrain station with associated parking areas, but future development is contemplated for a mixed commercial-residential property with potential subterranean parking. The Site is bounded by: the railroad corridor owned by the PCJPB to the west; Concar Drive and highway CA -92 to the south; Station Park Green Redevelopment project to the east; and a grassy area adjacent to the railroad to the north.

2.1 GEOLOGIC AND HYDROGEOLOGIC SETTING

The Site is located in the Santa Clara Valley Groundwater Basin - San Mateo subbasin, which occupies a structural trough, sub-parallel to the northwest trending Coast Ranges, at the southwest end of San Francisco Bay. San Francisco Bay constitutes its eastern boundary. The Santa Cruz Mountains form the western margin of the San Mateo basin. The basin is composed of alluvial fan deposits formed by tributaries to San Francisco Bay, that drain the basin (DWR, 2004). Alluvium was encountered at the property immediately west if the Site to approximately 60-feet below ground surface (GeoCon, 2016).

The water bearing formations of the San Mateo subbasin are comprised of the Santa Clara Formation of Plio-Pleistocene age and the Quaternary age alluvial deposits. The Quaternary alluvium constitutes the most important water bearing formation and is composed of gravel, sand, silt and clay with various grain size distributions dependent on the depositional environment. Maximum thickness attained by the Quaternary alluvium is approximately 1,250 feet (DWR, 2004). The geology, encountered in borings advanced at the Site to approximately 15-feet below ground surface, was unconsolidated clay, silty clay, gravelly clay, silts, sandy clay/silts, clayey sand and sand. Copies of the Site boring logs are provided in Appendix A.

The groundwater flow direction presented in quarterly monitoring reports for the former Shell Branded Service Station at 1790 S. Delaware Street (4Q04 to 1Q08) ranged between south to southeast with a gradient of approximately 0.02 feet per foot. Groundwater samples collected at the former Shell Branded Service Station at 1790 S. Delaware Street during the first quarter of 2006 by Cambria Environmental Technology, Inc (Cambria) revealed total dissolved solids (TDS) up to 33,000 mg/l (Cambria, 2006). Groundwater concentrations exceeding 3,000 mg/l are not considered suitable or potentially suitable for municipal or domestic supply pursuant to the California Regional Water Quality Control Board - San Francisco Bay Region, *San Francisco Bay (Region 2) Water Quality Control Plan* (*Basin Plan*; Water Board, 2017).

2.2 SITE HISTORY

Prior to the 1940s, the Site and surrounding area were marshlands. Beginning in the 1940s, filling of the marshlands began. The Site had a rail spur (1900s to 1960s) that was connected to the Southern Pacific Railroad (currently Union Pacific Railroad) main line located to the southwest and used by the Leslie Salt Refining Company, C.E. Whitney Chemical Company and the L.C. Smith Asphalt Company for transporting bulk materials and refined products. The rail spur was removed in the 1960s for development of the Hayward Park Caltrain station. Highway 92 was also constructed during the 1960s to the south of the Site. The PJPB purchased the Site in 1992 from the Union Pacific Railroad and continued to operate as a train station.

2.2.1 L.C. Smith Asphalt Company

Between the 1950s and 1960s, the L.C. Smith Asphalt Company operated an asphalt plant on the Site and adjacent Station Park Green Project property located at 1700 South Delaware Street. The 1961 and 1969 Sanborn maps indicate the following asphalt plant features: hot asphalt mixing plant; gravel bunker; four aboveground storage tanks for oil and asphaltic cement: boiler house; dust house; oil heater house; switch house; dust collection bins; tool and welding sheds; equipment repair facilities; storage yards; and a scale house (EDR, 2011). City of San Mateo Fire Department records revealed that three underground storage tanks were installed at the

asphalt plant in 1961. These USTs and four additional aboveground tanks for fuel oil and asphalt were demolished by Concar Enterprises in 1973 (Versar, 2014). The 1974 aerial photograph indicates that the Site had been developed as it exists today and the L.C. Smith asphalt Company was no longer present.

2.3 SURROUNDING AREAS

The Site is surrounded by: the Station Park Green Project property located at 1700 South Delaware Street to the east; 470 Concar Drive to the southwest; and the Caltran station located to the west.

2.3.1 Station Park Green Project - 1700 South Delaware

The 11.9-acre Station Park Green Project located at 1700 South Delaware is on the eastern property boundary of the Site. Historical uses of the Site included: L.C. Smith Asphalt Company asphalt plant; sand and gravel operations; former Shell Branded Service Station; former Montgomery Ward Auto Service Center; and Kmart. Remedial actions, consisting of removing 22,770 tons of soil, were conducted at the Station Park Green Project and redeveloped as a mixed use, multi-family residential development constructed at-grade (GeoCon, 2016). The Station Park Green Project was closed by the SMCEH on September 30, 2016 (SMCEH, 2016).

2.3.1.1 INVESTIGATION AT PROPERTY BOUNDARY WITH 401 CONCAR DRIVE

Nine soil borings were advanced at the western border of the Station Park Green Project and 401 Concar Drive (the Site) by Versar, Inc. (Versar) during March 2014 as part of a Phase II investigation. Laboratory analysis of groundwater samples from the borings revealed the presence of total petroleum hydrocarbons (TPH) as: gasoline (TPHg) up to 19,000 micrograms per liter (µg/l); diesel (TPHd) up to 120,000 µg/l; and motor oil (TPHmo) up to 8,700 µg/l in shallow (15-feet to 20-feet below ground surface) groundwater from boring B-12. Laboratory analysis of soil samples collected at 401 Concar Drive revealed : TPHg up to 0.63 mg/kg (B-16

at 2.5-feet bgs); TPHd up to 530 mg/kg (B-16 at 2.5-feet bgs); and, TPHmo up to 2,200 mg/kg (B-15 at 2.5-feet bgs).

Additional Phase II samples collected on November 4, 2014 revealed TPHg in soil samples up to 340 mg/kg; TPHd up to 4,100 mg/kg; and TPHmo up to 30,000 mg/kg as (B-30) at nine-feet below ground surface adjacent to the former asphalt plant.

2.3.2 470 Concar Drive

470 Concar Drive, located 150 feet southeast of the Site was historically used for commercial or industrial operations (BAGG, 2000). During 2000, 2008, 2013 and 2014, soil and groundwater samples were collected at 470 Concar Drive and the adjacent 1830 South Delaware Street in preparation for construction of a commercial office building with underground parking. Groundwater samples collected during July and August 2000 by Bay Area Geotetechnical Group (BAGG) contained: TPHg up to 250 µg/l; TPHd up to 910 µg/l; and TPHmo up to 1,100 µg/l, although the laboratory noted that the chromatographs were not consistent with typical fuel (BAGG, 2000).

Additional groundwater investigations conducted by Environ in April 2008 revealed: TPHg up to 590 µg/l; TPHd up to 1,400 µg/l; TPHmo up to 1,800 µg/l; 2-butanone up to 230 µg/l; tert butyl alcohol (TBA) up to 3.3 µg/l; 1,2-DCA up to 950 µg/l; methyl tertiary butyl ether (MTBE) up to 77 µg/l; naphthalene up to 1 µg/l (Environ, 2008). Soil gas samples collected at 470 Concar Drive by Environ in 2008 revealed PCE up to 160 micrograms per cubic meter (µg/m^3).

2.3.3 Vail Burner & Oil Company - 1741 Leslie Street

Vail Burner & Oil Company operated a bulk oil storage and distribution facility at 1741 Leslie Street, located approximately 75-feet west of the Site, between 1940s and 1989 (GGT, 2006b). Features at 1741 Leslie Street included: two 20,000-gallon aboveground storage tanks (AST) for kerosene and diesel fuel; one 10,000-gallon AST for motor oil; one 420-gallon gasoline

underground storage tank (UST); and two 350-gallon heating oil USTs. In 1989, following removal of the ASTs, preliminary assessment investigations were conducted at 1741 Leslie Street. The investigations indicated releases of petroleum hydrocarbons to soil and groundwater. Between 1992 and 1998, the three USTs were removed and additional investigations conducted to delineate the extent of petroleum hydrocarbons in soil and groundwater.

Six monitoring well were installed in 1998 and 1999 and sampled periodically up until 2006. In 2003, additional monitoring wells were installed upgradient and downgradient of 1741 Leslie Street. Laboratory analysis of groundwater samples collected between 2003 and 2013 at downgradient monitoring well MW-8, located upgradient of the Site, revealed: TPHg up to 509 µg/l; TPHd up to 2,100 µg/l; benzene up to 0.8 µg/l; xylenes up to 1.5 µg/l; and MTBE up to 1.1 µg/l (GeoTracker). This Site received a no further action letter from the SMCEH on September 22, 2015 (SMCEH, 2015).

3.0 SUMMARY OF INVESTIGATIONS

During May 2016, WEST advanced borings at 24 locations (W-1 to W24) for collection of soil, soil gas and groundwater samples (Figure 3-1). Summaries of the soil, soil gas and groundwater analytical data is presented in Tables 3-1 to 3-5 and depicted on Figure 3-1. Details of the investigation are presented below.

3.1 PERMITTING AND UTILITY CLEARANCE

Prior to boring advancement, permits were obtained from: Caltrans for encroachment onto the Hayward Park Caltrain Station (Agreement No. 800705); and from the San Mateo County Environmental Health Department (SMCEH; Permit Number 16-0793). Pursuant to California Assembly Bill AB 73, Underground Services Alert (USA) was contacted to locate utilities. A private underground utility locating contractor, Coast Wide Utility Locators, of Felton, California, was also used to identify subsurface utilities/conduits in the boring areas.

3.2 HEALTH AND SAFETY

A Site-specific *Health and Safety Plan* ("*HASP*") was prepared to address worker health and safety during investigation activities. The *HASP* was prepared in accordance with the California Occupational Health and Safety Administration (CalOSHA) Title 8 §5192 Hazardous Waste Operations and Emergency Response and United States OSHA 29 CFR 1910.120, Hazardous Waste Operations and Emergency Responses. The *HASP* was read and signed by all on-Site workers and Site visitors prior to entering the work area.

3.3 SOIL BORINGS

WEST advanced soil borings at 24 locations (W1 to W24) at the Site between May 23, 2016 and May 26, 2016 for collection of soil and groundwater samples. Additional borings were advanced in six of the 24 locations for collection of soil gas samples (W-2, W-5, W-8, W-13, W-16 and W-20).

The borings were drilled using approximately 3.25-inch direct-push equipment operated by Gregg Drilling and Testing, Inc., of Martinez, California, a California C-57 licensed well drilling contractor, following hand clearing to five-feet below ground surface. Soil cores were collected continuously into a 2-inch diameter 4-foot long continuous core barrels outfitted with acetate liners. The lithology of the soil cores was described on boring logs using the Unified Soil Classification System (USCS). The soil cores were also field screened for total organic vapors using a photoionization detector (PID) equipped with a 10.6 eV lamp and calibrated to 100 parts per million by volume (ppm_v) using isobutylene gas. Copies of the boring logs are included in Appendix B.

The borings for soil gas sampling were advanced to 4-feet below ground surface. The borings for soil and groundwater sampling were advanced to approximately two feet below first encountered groundwater measured at approximately 5.5-feet to 14.5-feet below ground surface. The down-hole reusable sampling equipment was decontaminated prior to reuse at each sampling location. Once sampling was complete, the borings were backfilled to the surface with Portland Type II cement grout in accordance with SMCEH permit requirements. The borings were then completed to match the existing ground surface.

3.3.1 Investigation-Derived Waste Management

Soil cuttings and groundwater generated during boring advancement were placed in United States Department of Transportation (USDOT) approved 55-gallon steel drums. The 55-gallon drums were be labeled and temporarily stored at the Site pending analytical review of the soil samples. The soil cuttings were disposed following receipt of the soil laboratory analytical data and acceptance by an appropriately licensed disposal facility.

3.4 SOIL INVESTIGATIONS

3.4.1 Soil Sample Collection Methodology

Soil samples were collected from borings from the selected depth intervals by cutting the acetate liners at the target depths (Table 3-1). The ends of the acetate liner samples were then covered with Teflon sheets and plastic end caps. The soil samples were then labeled, placed in a cooler with ice and transported to K Prime, Inc., of Santa Rosa, California, a California Department of Public Health (CDPH) Environmental Laboratory Accreditation Program (ELAP) certified laboratory following the chain-of-custody procedures outlined in ASTM D 4840.

Seventy-six soil samples were analyzed for one or more of the following: total petroleum hydrocarbons (TPH) as gasoline (TPHg), diesel (TPHd) and motor oil (TPHmo) range organics by USEPA Method 8015B without silica gel cleanup; volatile organic compounds (VOCs) by USEPA Method 5035/8260B; semi volatile organic compounds (SVOCs) by USEPA Method 3550/8270C; organochlorine pesticides by USEPA 8081; polychloride biphenyls (PCBs) by USEPA 8082; and Title 22 Metals by USEPA Method 6000/7000 series. The 5035A soil sample preparation was conducted by the laboratory.

3.4.2 Soil Sample Analytical Results

Laboratory analysis revealed the TPH as gasoline up to 181 mg/kg (W-10), diesel up to 14,700 µg/l (W-6) and motor oil up to 11,600 mg/kg (W-6). VOCs were not detected in soil samples above their laboratory reporting limits presented in Table 3-1.

Semi-volatile organic compounds (SVOCs) were detected in samples from two (W-12, W-14) of the nine soil borings advanced at the Site, including: fluorene up to 8,420 µg/kg (W-14); 2-methylnapthalene up to 16,100 µg/kg (W-14); naphthalene up to 4,410 µg/kg g (W-14); phenanthrene up to 9,330 µg/kg (W-14); and pyrene up to 9,860 µg/kg (W-14; Table 3-2).

Pesticides were not detected in the 45 soil samples analyzed with the exceptions of: chlordane at 20.5 µg/kg and 109 µg/kg in two samples collected at one-foot below ground surface (W-14 and W-20) and dieldrin in one soil sample collected one-foot below ground surface at 7.57 µg/kg (W-14). PCBs were reported at 40.9 µg/kg (W-14) and 89.7 µg/kg (W-13) in two of the of the twenty soil samples analyzed for this parameter (Table 3-2).

Laboratory analysis of 76 soil samples for metals revealed the presence of 11 metals, including: arsenic at less than the laboratory-reporting limit of 2.50 mg/kg to 12.7 mg/kg (W-20 at one-foot below ground surface); and lead at less than the laboratory reporting limit of 2.50 mg/kg to 2,640 mg/kg (W-17 at seven-feet below ground surface; Table 3-3).

A summary of the soil analytical results is included in Tables 3-1 to 3-3 and depicted on Figure 3-1. Copies of the laboratory data certificates and chain-of-custody forms are included in Appendix D.

3.5 GROUNDWATER INVESTIGATIONS

3.5.1 Depth-Discrete Groundwater Sample Collection Methodology

Groundwater samples were collected from 11 of the 24 soil borings using 0.75-inch diameter, five-foot long Schedule 40 PVC slotted casing with a pre-pack #2/16 sand filter placed in the soil borings (at 5- to 15-feet below ground surface). The top of the pre-pack slotted casing was outfitted with 0.75-inch diameter Schedule 40 PVC blank well casing to the ground surface. The temporary screen was left fro approximately two-hours to allow groundwater to enter the borings.

Groundwater samples were collected into laboratory supplied containers using a peristaltic pump with disposable polyethylene 0.25-inch diameter tubing. The groundwater samples were submitted to K Prime, Inc., of Santa Rosa, California, a CDPH ELAP certified laboratory, for analysis of: TPHg using USEPA 8015B; TPHd using USEPA 8015B without silica gel cleanup and VOCs using USEPA Method 5035/8260B.

3.5.2 Depth-Discrete Groundwater Sample Analytical Results

Laboratory analysis of the eleven groundwater samples for chlorinated VOCs revealed the presence of PCE in one groundwater sample at 4.76 µg/l collected from boring W-12. The gasoline additive 1,2-dichlorethane (1,2-DCA) was reported to be present in the sample from boring W-22 at 5,750 µg/l, which was collected from the eastern most boundary with the Station Park Green site, where previous investigations have revealed the presence of gasoline in groundwater. The groundwater sample from boring W-17, located toward the middle of the Site did not reveal the presence of 1,2-DCA above its laboratory-reporting limit of 0.500 µg/l.

The VOC chloromethane (CM) was detected in one groundwater sample from boring W-6, located toward the northern end of the Site at 7.81 µg/l with chloroethane (CA) at 2.65 µg/l. Other chlorinated VOCs were not detected above their respective laboratory-reporting limits.

The petroleum related VOCs detected in groundwater samples (presented in Table 3-4) included: benzene, toluene, ethyl benzene and xylenes in two samples (W-12 and W-14) up to 4.62 µg/l, 1.6 µg/l, 2.29 µg/l and 3.63 µg/l, respectively.

The groundwater sampling revealed the presence of petroleum hydrocarbons in the gasoline range (TPHg) in samples from three of the temporary groundwater wells. The highest detection of TPHg was found in the sampling from W-22 at 256 µg/l, near the locations of the TPHg detections on the Station Park Green site (previously reported up to 190,000 µg/l from boring B12).

Groundwater samples revealed the presence of TPHd up to 11,700 µg/l in the sample collected from boring W-12 and at 8,460 µg/l in the sample from W-14. Lower concentrations of TPHd were reported in samples from borings W-6 (2,950 µg/l), W-9 (838 µg/l), W-15 (1,260 µg/l), W-17 (566 µg/l), W-22 (811 µg/l), W-23 (264 µg/l) and W-24 (570 µg/l).

A summary of the groundwater analytical data is presented in Table 3-4 and depicted on Figure 3-1. Copies of the laboratory data certificates and chain-of-custody forms are included in Appendix B.

3.6 SOIL GAS INVESTIGATIONS

Six soil gas samples (W-2, W-5, W-8, W-13, W-16 and W-20) were collected from vapor points installed within the soil boring locations depicted on Figure 3-1 in accordance with the California Environmental Protection Agency's, Department of Toxic Substances Control (DTSC) *DTSC Advisory - Active Soil Gas Investigation* (DTSC, 2015). The temporary vapor point construction and soil gas sample collection methodology is summarized below.

3.6.1 Temporary Vapor Point Construction

Temporary vapor probes were constructed within soil borings advanced to approximately 4-feet below ground surface. Once the boring target depth had been reached and the rods withdrawn, an approximately 6-inch thick layer of #3 Monterey filter sand was placed at the base of the borehole. Following filter sand placement, an approximately 2-inch long, 0.375-inch diameter polypropylene/stainless steel filter tip outfitted with a length of polyethylene tubing was lowered into the borehole. Additional filter sand was then added between the base of filter tip to approximately 6-inches above the top of the filter tip. Approximately 1-foot of dry bentonite granules was then placed above the sand filter pack. Hydrated bentonite granules were then placed above the filter sand within the borehole to the ground. A gas-tight valve or fitting was then installed on the sample tubing.

3.6.2 Soil Gas Sample Collection Methodology

3.6.2.1 Equilibrium Period and Shut-In Testing

To allow for equilibration, the vapor samples were collected at least 30-minutes following installation. Prior to sample collection: a shut-in test was conducted for 10 minutes to confirm that the aboveground sampling apparatus was not leaking.

3.6.2.2 Purge Testing

Following the shut-in test, three volumes of stagnant air from the tubing, internal volume of the probe, void space of sand pack around the probe tip, void space of the dry bentonite and sampling manifold, was purged using a peristaltic pump. During purging PID readings leaving the purging apparatus was reported up to 0.2 parts per million by volume (ppm_v)

3.6.2.3 Soil Gas Sample Collection

Following purging, the peristaltic pump was turned off and the vapor flow directed through the 125 ml/min manifold into laboratory-prepared one-liter Summa canisters with a vacuum of approximately 30-inches of mercury. An inline gauge on the sampling manifold was used to check that the vapor probe vacuum was less than 100-inches of water during sampling. During sample collection, the helium within the shroud and vacuum in the Summa canister was recorded every two minutes. Once the Summa canister was filled, the flow control valve was closed and the final canister atmosphere recorded on the field data forms (Appendix C).

The Summa canisters were transported to K Prime, Inc., of Santa Rosa, a CDPH ELAP certified laboratory following chain-of-custody procedures outlined in ASTM D 4840. The soil gas samples were analyzed for VOCs using USEPA Method TO15 and helium by ASTM D-1946.

3.6.3 Soil Gas Analytical Results

Laboratory analysis of the soil gas samples revealed the presence of: tetrachloroethene in one sample (W-13) at 10.3 $\mu g/m^3$; benzene up to 9.81 $\mu g/m^3$ (W-16); toluene up to 46.5 $\mu g/m^3$ (W-8); 1,2,4-trimethylbenzene (1,2,4-TMB) up to 7.23 $\mu g/m^3$ (W-5); and 1,3-dichlorobenzene (1,3-DCB) up to 8.66 $\mu g/m^3$ (W-16). Other VOCs were not detected above their laboratory reporting limits. A summary of the soil gas analytical data is presented in Table 3-5. Field data sheets are provided in Appendix C. Copies of the laboratory data certificates and chain-of-custody forms are included in Appendix D.

4.0 DATA EVALUATION

Investigations have revealed the presence of: TPHd, SVOCs, lead and pesticides in soil; VOCs in soil gas; and TPH and VOCs in groundwater. To assess the potential risks to human health and the environment associated with the presence of chemicals at the Site, Conceptual Site Model (CSM) was developed and the data were compared with applicable screening levels

4.1 CONCEPTUAL SITE MODEL

Pursuant to State Water Resources Control Board (SWRCB) guidelines (Executive Order D-5-99 and Senate Bill 989), a CSM has been developed for the Site. The CSM represents the assemblage of the existing Site data and the general physical conditions that influence contaminant transport.

Petroleum hydrocarbons have been found in soil and groundwater on the Site. There appears to be more than one source of the petroleum hydrocarbons. Relatively heavy petroleum hydrocarbons, i.e., in the diesel range (TPHd) and motor oil range (TPHmo,) have been found in soil up to 14,700 mg/kg and 11,600 mg/kg, respectively (W-6 at 2-feet below ground surface). The occurrence of the heavier hydrocarbons in soil appears related to historical operation of the asphalt plant on and near the property. Generally, the higher concentrations of heavier hydrocarbons are limited in extent to the areas near boring W-6, W-12 and W-14, with lower concentrations distributed ubiquitously in soil at the Site. There presence of the higher concentrations of TPHd in soil is generally coincident with the higher detections of TPHd in groundwater, e.g., W-6 at 2,950 µg/l; W-12 at 11,700 µg/l and W-14 at 8,460 µg/l.

The higher concentrations of petroleum hydrocarbons in the gasoline range (TPHg) are present primarily in samples collected on the Station Park Green project located to the east, e.g., 190,000 µg/l in the sample from B12. Lower concentrations of TPHg were found in samples collected on the Site with the highest detection being reported in the sample from boring W-22 (located near B12) at 256 µg/l.

4.2 SCREENING LEVEL ASSESSMENT

A screening level assessment was prepared to evaluate the adequacy of the investigations. The screening level assessment consisted of: (1) identification of applicable screening levels for each media; and (2) a comparative analysis between the identified screening criteria and the Site data.

4.2.1 Exposure Concentrations

The maximum-detected concentrations of the chemicals in media were used to compare with the selected screening levels. The USEPA recommends that maximum beneficial uses of a property be the basis of evaluation. The Site is currently commercial but there is potential development to high-density residential. The Site is currently paved and or will be covered by buildings and paved areas in the future, i.e., no terrestrial habitat exposure. Groundwater is not reasonably anticipated to be used as a municipal source as TDS in groundwater was reported at greater than 3,000 mg/l on the adjacent property.

4.2.2 Background Concentrations

Measurable concentrations of metals, including arsenic, may represent background concentrations associated with natural and anthropogenic sources. The CalEPA advises that naturally occurring arsenic in soil is frequently higher than the risk-based concentration set at a one-in-one-million cancer risk (the residential ESL for arsenic in soil is 0.067 mg/kg). The CalEPA has usually required cleanup to background when chemicals are present that are due to anthropogenic sources. Background arsenic in the San Francisco Bay Region has been estimated at up to 11 mg/kg (Duverge, 2011).

4.2.3 Identification of Screening Criteria

Based on the identified exposure pathways, screening levels were selected for chemicals in media from: the Regional Water Board January 2019 Environmental Screening Levels (Regional Water

Board, 2019; ESLs) for soil, soil gas and groundwater. Soil was screened with respect to residential and commercial human health exposure screening criteria. Groundwater was screened as a non-drinking water resource. The soil, soil gas and groundwater screening criteria are presented in Tables 3-1 to 3-5.

4.2.3.1 ENVIRONMENTAL SCREENING LEVELS

The Regional Water Board has developed ESLs to provide conservative screening levels for over 100 chemicals commonly found at sites with contaminated soil, soil gas and groundwater. The ESLs are intended to help expedite the identification and evaluation of potential environmental concerns at contaminated sites. ESLs address a range of media (soil, groundwater, soil gas, and indoor air) and a range of concerns (e.g., impacts to drinking water, vapor intrusion, terrestrial toxicity and impacts to aquatic life). The ESL documents are prepared by staff of the Regional Water Board.

In developing the ESLs, the Regional Water Board has considered exposure pathways to humans including: direct contact; ingestion; inhalation and resource protection. The ESLs use a depth of: 10-feet to delineate between surface (shallow) soil and subsurface (deep) soil. The ESLs have been calculated based on default exposure criteria to represent the lower of either the hazard quotient (HQ) of 1.0 for non-carcinogenic effects and incremental lifetime cancer risk (ILCR) of one in one million exposed (1E-6).

4.3 COMPARATIVE ANALYSIS

The concentrations of CVOCs have been compared to the identified screening criteria to assist in identifying areas needing additional evaluation or the need for immediate response actions.

4.3.1 Soil Conditions

The concentration of TPHg in soil samples was reported up to 181 mg/kg (W-10 collected at 3-feet below ground surface); above its Tier 1 ESL of 100 mg/kg for protection of groundwater and its gross contamination ESL of 100 mg/kg (Table 3-1).

TPHd in soil was reported: above the Tier 1 ESL of 260 mg/kg in 18 (298 mg/kg to 14,700 mg/kg) of the 58 soil samples analyzed; and above the gross contamination ESL of 500 mg/kg in eight (665 mg/kg to 14,700 mg/kg) of the 58 soil samples analyzed, with the highest concentrations reported in soil samples collected from borings W-6, W-12 and W-14 (Table 3-1).

VOCs in soil were not detected above their respective Tier 1 ESLs. SVOCs were detected in soil samples from two (W-12, W-14) of the nine soil borings advanced at the Site (W-12 to W-20), including: fluorene up to 8,420 µg/kg; (W-14) above its Tier 1 ESL of 6,000 µg/kg; 2-methylnapthalene up to 16,100 µg/kg (W-14) above its Tier 1 ESL of 880 µg/kg; naphthalene up to 4,410 µg/kg (W-14) above its Tier 1 ESL of 42 µg/kg; phenanthrene up to 9,330 µg/kg (W-14);. Pyrene in soil was detected up to 9,860 µg/kg (W-14), which is below its Tier l ESL of 45,000 µg/kg (Table 3-2).

The pesticide chlordane was reported at less than the laboratory reporting limit of 12.5 µg/kg to 125 µg/kg, with the exception of three samples collected at one- foot below ground surface (14.8 µg/kg at W-11, 20.5 µg/kg at W-14 and W-20 at 109 µg/kg), above its Tier 1 ESL of 8.5 µg/kg. One soil sample collected at one-foot below ground surface and analyzed for dieldrin was detected above its laboratory-reporting limit of 5 µg/kg to 50 µg/kg (W-14 at 7.57 µg/kg), which above its Tier 1 ESL of 0.46 µg/kg. PCBs were detected in soil up to 89.7 µg/kg (W-13), which is below its Tier 1 ESL of 230 µg/kg (Table 3-2).

Arsenic was reported in soil samples at less than the laboratory-reporting limit of 2.50 mg/kg to 12.7 mg/kg, which is consistent with background for the San Francisco Bay area. Nine of these 46 soil samples were reported to contain lead above the Tier 1 ESL of 32 mg/kg, with the highest lead

in soil reported in sample W-17 collected at seven-feet below ground surface (2,640 mg/kg). Cobalt was reported above the Tier 1 ESL of 23 mg/kg in two of 16 soil samples analyzed for this parameter (W-4 at 32.3 mg/kg and W-18 at 30.4 mg/kg, both collected at 10-feet below ground surface). All of the 16 soil samples analyzed for vanadium were above its Tier 1 ESL of 18 mg/kg for protection of terrestrial habitat below its residential ESL of 390 mg/kg.

4.3.2 Soil Gas Conditions

PCE in six soil gas samples collected from 3 to 3.5-feet below ground surface was reported at less than the laboratory reporting limit of 6.78 μg/m^3, with the exception of 10.3 μg/m^3 in sample W-13. PCE in soil gas at 10.3 μg/m^3 is below its Tier 1 ESL for protection of indoor air of 15 μg/m^3. Benzene in soil gas was reported at 3.67 μg/m^3 to 9.81 μg/m^3, which is above its residential ESL of 3.2 μg/m^3 for protection of indoor air,.

4.3.3 Groundwater Conditions

Gasoline was detected in groundwater above its laboratory-reporting limit of 50 μg/l in four of eleven samples analyzed (W-14 at 185 μg/l, W-12 at 198 μg/l and W-22 at 256 μg/l); above its Tier ESL of 100 μg/l. TPHd in groundwater ranged from 325 μg/l to 11,700 μg/l (W-12); above its Tier 1 ESL of 100 μg/l.

The chlorinated VOC, 1,2-DCA, was detected above its laboratory-reporting limit of 0.500 μg/l in two of 11 samples analyzed (W-23 at 2.89 μg/l and 5.750 μg/l at W-22); below its Tier 1 ESL of 50 μg/l. The petroleum related VOCs, benzene and naphthalene, were detected above their laboratory-reporting limits of 0.500 μg/l and 1.00 μg/l, respectively, in two samples (W-12 and W-14). Benzene in groundwater was detected at 2.69 μg/l (W-12) and 4.62 μg/l (W-14); above its Tier 1 ESL of 0.42 μg/l. Naphthalene was detected at 9.87 μg/l (W-12) and 23.5 μg/l (W-14); above its Tier 1 ESL of 0.17 μg/l. Other chlorinated and petroleum related VOCs were not detected above their respective Tier 1 ESLs (Table 3-4).

PERMITS

ORDINANCE: 04023

ENVIRONMENTAL HEALTH
SAN MATEO COUNTY

Protecting Our Health and Environment

PERMIT 16- 0793

P/E: 2010 MONITORING WELLS - INSTALLATION/DESTRUCTION

FACILITY:
401 CONCAR DRIVE, SAN MATEO

OWNER:
PENINSULA CORRIDOR JOINT POWE
1250 SAN CARLOS AVE
SAN CARLOS

WP0010762 FA0060199
035200999
AMOUNT PAID: 629.00

CONTRACTOR:
GREGG DRILLING

TERMS & CONDITIONS:

CONSTRUCT SOIL BORINGS (20)
CONSULTANT: WEST ENVIRONMENTAL SERVICES & TECHNOLOGY
PROJECT MGR: PETER MORRIS
SEE SPECIAL CONDITIONS NOTED ON APPLICATION

CHARLES ICE

ENVIRONMENTAL HEALTH SPECIALIST

DATE ISSUED: 4/26/2016

EXPIRATION DATE: 8/26/2016

THIS PERMIT IS NONTRANSFERABLE AND MUST BE POSTED ON-SITE IN A CONSPICUOUS PLACE

$ PAID 629.00 CC AUTH

SAN MATEO COUNTY ENVIRONMENTAL HEALTH
APR 21 2016
RECEIVED

2016 SUBSURFACE DRILLING PERMIT APPLICATION

SAN MATEO COUNTY ENVIRONMENTAL HEALTH SERVICES DIVISION
2000 ALAMEDA DE LAS PULGAS, SUITE 100, SAN MATEO, CA 94403
VOICE (650) 372-6200 FAX (650) 627-8244 WWW.SMCHEALTH.ORG

REVISED FEES (8/1/15):
$629.00 (env. borings or any wells)
$393.00 (geotechnical borings only)

Allow 3 full working days for processing a complete permit application which includes payment.
Drilling **start date & time** must be scheduled with county staff at (650) 464-0047 or drilling@smcgov.org **at least 2 full working days (i.e. 48 hours) in advance.**

PURPOSE OF APPLICATION
- ☐ Groundwater Monitoring/Vapor Well Installation
- ☐ Groundwater Monitoring/Vapor Well Destruction
- ☒ Construct Soil Borings (variance request if to be left open >24 hours)
- ☐ Extension of Permit #

No. of Wells ____ No. of Borings 20 Well/Boring Names W-1 to W-20

PURPOSE OF DRILLING
- ☒ Environmental
- ☐ Geotechnical

LEAD AGENCY
- ☐ County GPP (permit approval is not to be considered work plan approval)
- ☐ RWQCB/DTSC/USEPA (Provide approval letter)
- ☒ None (i.e. voluntary)

SITE/ DRILLING INFORMATION

Agency Case # n/a Assessor's Parcel # (Required) 035-020-200 ~~Parcel 2~~ 999 (one per permit)

Drilling Location Address 401 Concar Drive City San Mateo Zip 94402

To Be Constructed In: ☐ Public Property ☒ Private Property ☐ Refuse

Maximum Proposed Depth (wells/borings) 15 (feet) Drilling Method Geoprobe

Boring Diameter 2-inch Casing Diameter n/a Filter Pack Interval n/a Screen Interval n/a

Destruction Method(6 gallons water max/94 lb cement, up to 5% bentonite):
- ☒ Pressure Grouting (provide well construction logs and grout calcs)
- ☐ Overdrilling (guide rods for total depth prior to starting required)

WELL/BORING OWNER

(Well/boring owner name or contact person should match signature)

Name Peninsula Corridor Joint Powers Board Contact Person Brian Fitzpatrick

Address 1250 San Carlos Ave City, State, Zip San Carlos, CA 94070

 2016 SUBSURFACE DRILLING PERMIT APPLICATION

REQUIREMENTS:

An accurate and correct map **must** be submitted with the application and include the following: north arrow, existing and historic site features, existing and proposed well/boring locations to scale, property lines and any other pertinent information. A work plan describing the drilling and construction/destruction methodology may be requested by County staff. A complete application with appropriate fees must be submitted 3 working days in advance of drilling and notification of start date and time must be provided at least 2 working days prior to drilling. The permit is subject to both General and Special Conditions stated below. A copy of the approved Subsurface Drilling Permit **must** be available on site while work related to the permit is being performed. Drilling may begin at the notified date and time whether County staff is present or not.

GENERAL CONDITIONS:

A. Field notification must be provided to GPP drilling inspection staff at least 2 full working days prior to the start of drilling.

B. Well and boring construction and destruction under this permit are subject to the Standards for the Construction of Wells in San Mateo County, County Groundwater Protection Program (GPP) Guidelines, Policies & Procedures, the State Water Well Standards, and any instructions by a Health Department representative.

C. Well/Boring Owner, Driller, and Responsible Professional assume responsibility for all activities and uses under the permit, including compliance with Workmen's Compensation Laws, and indemnify, defend and save the County of San Mateo, its officers, agents and employees, free and harmless from any and all expense, cost, or liability in connection with or resulting from work or stopped-work associated with the permit, including, but not limited to, property damage, personal injury, wrongful death, and loss of income.

D. All borings **must** be properly destroyed (grouted/sealed) within 24 hours of drilling, unless special conditions are approved beforehand in writing as part of this permit, and must be continuously protected and stabilized. For well destruction, provide final grout volumes.

E. Analytical results of all soil, vapor, and groundwater samples collected during the execution of drilling under this permit **must** be submitted to County GPP staff by the Responsible Professional within 60 days of sample collection. If contamination is discovered during drilling, verbal notification to County GPP by the Responsible Professional is **required** within 72 hours of discovery. Proper storage, labeling & disposal of investigation-derived residual wastes are the responsibility of the consultant unless stated otherwise contractually. Provide justification for >10% difference between calculated versus actual grout used. Overdrill may still be required for >10% difference.

F. A copy of the State DWR Form 188, boring logs, well construction details, and finalized as-built locations for all borings/ wells (except geotechnical borings) signed by a Responsible Professional, **must** be submitted to County GPP by the Responsible Professional within 60 days of drilling/construction/destruction.

G. Permit is valid only for the purpose specified herein. No change in purpose or required procedures, as described on this permit application, in the associated workplan, or in the special conditions below, will be allowed except upon written permission from the County. Construction aspects can be changed based on conditions encountered in the field.

H. Permit is valid for **one** mobilization associated with originally permitted boring/well locations only, including contingency locations, and is automatically canceled if not exercised, or if an extension is not applied for and granted within 120 days of the original permit issuance date. Failure to notify staff of cancellation or delay in start time will result in the Consultant being billed an Inspection Cancellation fee of $288 for 2016 if GPP staff attempted to perform an inspection.

I. Wells installed under this permit may not be used for domestic, municipal, agricultural, or irrigation water supply.

J. All work performed **must** conform to Business and Profession Codes and State Water Well Standards.

K. Top-of-casing elevation of all wells **must** be surveyed to the nearest 0.01-foot relative to Mean Sea Level or NAVD88 and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate. Geotechnical wells are exempt from this requirement if a written variance from GPP is obtained prior to drilling.

L. Latitude and longitude of all wells **must** be surveyed with sub-meter accuracy relative to NAD83 and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate.

M. Violation of any requirement or general or special permit condition may result in an order by GPP staff to cease work under this permit, correct the violation, potentially re-permit the work as a new mobilization, and potential actions may be taken against the Well Owner, Property Owner, or Responsible Professional by GPP.

SPECIAL CONDITIONS: (agency use only) If collecting groundwater samples in ~3/4" PVC, please be sure to bring grout pump to properly destroy boring using ~3/4" PVC pipe as tremmie pipe. Properly mixed grout will not naturally pass through screened section with just gravity and small weight of grout in shallow boring.

For Agency Use Only:
County Approval: Charles Lee FA# _____ Date: April 22, 2016

NOTES:

DRO	Diesel Range Organics (C12-C23)
ND	Not Detected at or above the stated MRL
NA	Not Applicable or Available
MRL	Method Reporting Limit
AD	Typical Pattern for Diesel
AM	Hydrocarbon response is in the C12-C22 range
AC	Heavier hydrocarbons contributing to diesel range quantitation
AJ	Heavier hydrocarbon than diesel
AK	Lighter hydrocarbon than diesel
AE	Unknown hydrocarbon with a single peak
AN	Unknown hydrocarbon with several peaks

ACCT: 9946
PROJ: REGIS.SANMATEO.HAYWARDPARK

FROM: Richard A. Kagel, Ph.D. RAK 6/1/2016
Laboratory Director

SUBJECT: LABORATORY RESULTS FOR YOUR PROJECT REGIS.SANMATEO.HAYWARDPARK

Enclosed please find K Prime's laboratory reports for the following samples:

SAMPLE ID	TYPE	DATE	TIME	KPI LAB #
W-2-3.5	AIR	05/23/16	17:28	143631
W-8-3.5	AIR	05/24/16	11:53	143632
W-20-3.5	AIR	05/24/16	13:36	143633

The above listed sample group was received on 05/24/16 and tested as requested on the chair of custody document.

Please call me if you have any questions or need further information.
Thank you for this opportunity to be of service.

W-6-2	143651	05/23/2016	16:15	052716S1	05/27/2016	1.00	ND	

NOTES:
ND - NOT DETECTED AT OR ABOVE THE STATED METHOD REPORTING LIMIT
NA - NOT APPLICABLE OR AVAILABLE
MRL - METHOD REPORTING LIMIT
AE - UNKNOWN HYDROCARBON WITH A SINGLE PEAK
AN - UNKNOWN HYDROCARBON WITH SEVERAL PEAKS
AS - HEAVIER HYDROCARBON THAN GASOLINE CONTRIBUTING TO GRO VALUE
CO - HYDROCARBON RESPONSE IN GASOLINE RANGE BUT DOES NOT RESEMBLE GASOLINE

ACCT: 9946
PROJ: REGIS.SANMATEO.HAYWARDPARK

FROM: Richard A. Kagel, Ph.D.
Laboratory Director RAK/mj ck 6/15/2016

SUBJECT: LABORATORY RESULTS FOR YOUR PROJECT REGIS.SANMATEO.HAYWARDPARK

Enclosed please find K Prime's laboratory reports for the following samples:

SAMPLE ID	TYPE	DATE	TIME	KPI LAB #
W-23-3	SOIL	5/24/2016	NA	143653
W-23-7	SOIL	5/24/2016	NA	143654

The above listed sample group was received on 5/24/2016 and tested as requested on the chain of custody document.

Please call me if you have any questions or need further information.
Thank you for this opportunity to be of service.

Laboratory Director

SUBJECT: LABORATORY RESULTS FOR YOUR PROJECT REGIS.SANMATEO.HAYWARDPARK

Enclosed please find K Prime's laboratory reports for the following samples:

SAMPLE ID	TYPE	DATE	TIME	KPI LAB #
W-13-3.5	AIR	05/24/16	16:55	143686
W-16-3	AIR	05/25/16	14:05	143687

The above listed sample group was received on 05/25/16 and tested as requested on the chain of custody document.

Please call me if you have any questions or need further information.
Thank you for this opportunity to be of service.

ACCT: 9946
PROJ: REGIS.SANMATEO.HAYWARDPARK

FROM: Richard A. Kagel, Ph.D.
Laboratory Director RAK 6/6/2016

SUBJECT: LABORATORY RESULTS FOR YOUR PROJECT REGIS.SANMATEO.HAYWARDPARK

Enclosed please find K Prime's laboratory reports for the following samples:

SAMPLE ID	TYPE	DATE	TIME	KPI LAB #
W-22-3	SOIL	5/25/2016	13:30	143710
W-22-7	SOIL	5/25/2016	13:50	143711
W-24-3	SOIL	5/24/2016	14:15	143712
W-24-7	SOIL	5/24/2016	14:45	143713
W-24	WATER	5/24/2016	15:40	143714

The above listed sample group was received on 5/25/2016 and tested as requested on the chain of custody document.

Please call me if you have any questions or need further information.
Thank you for this opportunity to be of service.

K PRIME, INC.
LABORATORY REPORT

K PRIME PROJECT: 9946
CLIENT PROJECT: REGIS.SANMATEO.HAYWARDPARK

METHOD: GRO-GASOLINE RANGE ORGANICS
REFERENCE: EPA 8015B

SAMPLE TYPE: SOIL
UNITS: mg/Kg

SAMPLE ID	LAB NO.	DATE SAMPLED	TIME SAMPLED	BATCH ID	DATE ANALYZED	MRL	SAMPLE CONC	GRO PATTERN
W-22-3	143710	05/25/2016	13;30	052516S1	05/26/2016	1.00	ND	
W-22-7	143711	05/25/2016	13:50	052516S1	05/26/2016	1.00	ND	
W-24-3	143712	05/24/2016	14:15	052516S1	05/26/2016	1.00	ND	
W-24-7	143713	05/24/2016	14:45	052516S1	05/26/2016	1.00	ND	

NOTES:
ND - NOT DETECTED AT OR ABOVE THE STATED METHOD REPORTING LIMIT
NA - NOT APPLICABLE OR AVAILABLE
MRL - METHOD REPORTING LIMIT
AE - UNKNOWN HYDROCARBON WITH A SINGLE PEAK
AN - UNKNOWN HYDROCARBON WITH SEVERAL PEAKS
AS - HEAVIER HYDROCARBON THAN GASOLINE CONTRIBUTING TO GRO VALUE
CO - HYDROCARBON RESPONSE IN GASOLINE RANGE BUT DOES NOT RESEMBLE GASOLINE

To: cardonag@samtrans.com
Subject: Hayward Park Station Parking Lot
Attachments: EDR_SanbornMap_3787952 3S_111813 (002).pdf; Historic Fill topos aerials.pdf

Gary,

Per our conversation earlier today we have concerns that the contamination that Essex (1700 S Delaware, San Mateo) has removed from their adjoining parcel appears to extend or originate from the Caltrain parking lot. All of the current data is uploaded to Geotracker in several reports. The site is listed as Station Park Green (Geotracker ID T10000006956). I have attached some Sanborn Maps that show a company named LC Smith operated the plant. The plant appears to be mostly on the Caltrain Parking parcel. I have been informed that LC Smith was dissolved in the 1970's. We will likely be sending out opening site letters this month and we want to have all the information we can prior to that letter. Thank you.

Subject: Former Asphalt Plant On Concar Dr., San Mateo, CA 94402

Gary,

We have let this project sit for a little while. All of the data we have is in Geotracker for Station Park Green. We still think there is enough data to open a site (we already have). It is time to get together and talk about moving this site forward. Let me know when you have some time. Thanks.

Subject: RE: Regarding location of Station Park Green Boring B12

Marc,

The following para. is from Versar's Phase I ESA of the SPG property prepared on behalf of Essex. The SLIC listing refers to the entire corridor, and we did not find specific references supporting the SLIC listing.

"The Caltrain Corridor (San Francisco to Santa Clara) is listed in the SLIC database and adjoins portions of the Site. The Caltrain corridor is reported to contain TPH and metals in soil with the case beginning in October 2001 and case closure on December 3, 2003. TPH in groundwater is likely to occur within the corridor, and has been historically demonstrated at the Site. The Caltrain corridor adjoins portions of the Site and is within the American Society for Testing Materials (ASTM) Critical Distance of the Site. Based on the facility being within the critical distance of the Site with similar impacts that have been identified at the Site, the Caltrain corridor presents a pVEC to the Site."

Regarding data indicative of contamination beneath the Caltrain corridor, my recollection is that pertains to two Vail-related wells proximal to the western boundary of the corridor that contain VOCs, as also described in the Phase I.

"Vail Burner & Oil (1741 Leslie), is located approximately 250 feet west and up gradient to the Site, beyond the adjoining Cal Train station and rail right-of-way, and has the potential to impact the Site. This facility has an open LUST case involving a release of diesel to soil and groundwater. A review of a groundwater monitoring report indicated that the monitoring wells closest to the Site are impacted by TPH-diesel and CVOC. The TPH-d and Chlorinated Volatile Organic Compound (CVOC) impacts from this facility have not been defined to the east (towards the Site) and as such, this facility represents an off-Site REC and pVEC to the Site."

Given what we found on the SPG property in the western area with respect to heavy-weight TPH, at or close to free-product levels in some locations, it seems reasonable to assume that similar conditions exist within the Caltrain property where the same or similar historical features and uses were located. It is unfortunate that contamination of the abandoned storm drain line bounding the CalTrain and SPG properties has clouded and possibly concealed evidence of contaminants occurring along and/or migrating across the boundary from the Caltrain side.

- Tim

Subject: Re: Regarding location of Station Park Green Boring B12

Thanks. It helps some. The other question I have is that the Versar report indicates knowledge of a spill on Caltrain tracks and implies that there was data to show contamination on/under the parking lot area. This should be in addition to the historical UST location of Vail Burner on the west side of the tracks?? Thanks.

To: Marc R. Mullaney
Subject: Regarding location of Station Park Green Boring B12

Marc,

After reviewing figures prepared by Versar and Geocon showing the B12 location, I believe the location of boring B12 is relatively accurate in both sets of figures, representative versions of which are attached. The appearance of a difference may be attributed to two features of the Versar Phase II ESA figure, in which the yellow property boundary line appears to be drawn somewhat east of the actual boundary, which is better depicted on the Versar Supplemental Phase II ESA figure and the attached Geocon figure. Second, the icon representing the location of boring B12 appears to be larger on the initial Versar figure, therefore less precisely located than subsequent figures.

Additionally, review of the boring log for B3 of the Boundary TPH investigation indicates the boring intersected the stormdrain line that was found to be contaminated during Site grading and cleanup in that area. The boring log for B12, though a hydropunch and lacks soil observational detail, also suggests proximity to a shallow saturated horizon (see also the comments at the bottom of the log). This suggests that the two borings are relatively near one another.

I hope this information is helpful to you.

Sincerely,

Tim Berger, PG, CEG, HG | *Senior Geologist*

SMCo Case #119191 / RO2243
APN: 035-200-999

Stephen Chao
Peninsula Corridor Joint Powers Board (PCJPB)
1250 San Carlos Avenue
San Carlos, CA 94070

SUBJECT: PETROLEUM ADJACENT TO NORTHEAST SIDE OF HAYWARD PARK CALTRAIN STATION PARKING LOT, SAN MATEO, CALIFORNIA

Dear Mr. Chao:

The San Mateo County Groundwater Protection Program (GPP) staff email dated January 20, 2016, notified Gary Cardona of your office that petroleum contamination was encountered during the redevelopment of the property at 1700 South Delaware Street and that the contamination appeared to originate from the parking lot of the Hayward Park CalTrain station (this parking lot was formerly occupied by an asphalt plant). Our email dated September 20, 2016, requested a meeting and Mr. Cordona replied he was going to refer the matter to your attention. No work has been reported to our office since that date.

Our concern is up to 4,100 mg/kg of total petroleum hydrocarbons as diesel (TPHd) and 31,000 mg/kg of TPH as motor oil (TPHmo) were reported in soil samples collected from Boring 30 and RE-3 and these locations were adjacent to the former asphalt plant (refer to attached figures). These TPH concentrations exceed Environmental Screening Levels established by the Regional Water Quality Control Board (RWQCB), are indicative of free product, and no evidence has been submitted to demonstrate the extent, stability, and impact of this contamination on human health and environment has been assessed. Therefore, GPP staff opened an environmental oversight case under our voluntary cleanup program in accordance with California Health and Safety Code (CH&SC) Sections 101480 and 25260.

GPP staff have identified PCJPB as a potential responsible party (PRP) for the contamination by virtue of property ownership. However, GPP staff reserve the right to modify the identification of PRPs should additional information supporting the change become available, such as the identification of other property owners and people who operated the asphalt facility. Please contact Gregory J. Smith, Water Protection Programs Supervisor, at (650) 372-6279 to appeal our decision designating PCJPB as a PRP if specific information can be provided demonstrating PCJPB does not meet the definition of a responsible party. Please note, PRPs may or may not have signed civil contracts, such as a property

sales agreement, requiring other parties to perform any or all environmental investigation and remedial actions required by government agencies; however, the responsible party is ultimately responsible for complying with all government agency requests under the CH&SC and Water Code.

This site was opened under San Mateo County's Voluntary Cleanup Program because the source of the contamination does not appear to be an identifiable underground storage tank. Voluntary cleanup sites require the PRPs to reimburse the lead government agency for oversight time. The current GPP staff billing rate is $198 per hour. GPP staff will mail to your attention under separate cover a Remedial Action Agreement (RAA) detailing our oversight and your responsibilities under our voluntary cleanup program, including the billing of our oversight time. Your signature on the RAA acknowledges an understanding and acceptance of these responsibilities.

GPP staff are willing to oversee the investigation and potential cleanup of the contamination. However, the RWQCB and Department of Toxic Substances Control (DTSC) will be notified and may elect to become the lead oversight agency. If you do not sign the RAA and no other party volunteers to execute a RAA with our office, then we will transfer the case to the RWQCB or DTSC or, if applicable, transfer the case in our mandatory Unified Program Agency program. Even if you sign the RAA, you can always request the RWQCB or DTSC to become the lead oversight agency through the Brownfields Memorandum of Agreement or State Site Designation process by contacting Ron Goloubow of the RWQCB at 510-622-2442 (Brownfields Memorandum of Agreement process) or Laurie Grouard of the DTSC at 916-323-3394 (Site Designation process).

GPP staff would like to meet with you and your representatives to detail our oversight and your responsibilities under our voluntary cleanup program and to answer any questions regarding this process. Please provide me by **May 24, 2018,** the dates and times you are available to meet and the contact information of the participants. I will inform you of the date and time of the meeting once I receive this information. Please contact me at (650) 372-6292 or at dmilano@smcgov.org if you have any questions.

Sincerely,

Deno G. Milano, PG

RE: Remedial Action Agreement for Hayward Park Caltrain Station, San Mateo County Case #119191

Dear Ms. Forshey:

In response to your letter dated April 18, 2018, the Peninsula Corridor Joint Powers Board (JPB) is providing with this letter a signed copy of your Remedial Action Agreement for the Hayward Park Caltrain Station located at 0 Concar Drive in San Mateo, California, San Mateo County Site #119191, RO2243, Assessor Parcel Number 035-200-999, and GeoTracker Global ID (T10000008604).

We look forward to reviewing available site data and discussing appropriate paths forward for resolving this case with your agency. Please contact me at (650) 508-6301 or chaos@samtrans.com with any questions regarding this submittal.

Sincerely,

Stephen Chao
Deputy Director, Engineering

San Carlos, CA 94070

SUBJECT: PETROLEUM ADJACENT TO NORTHEAST SIDE OF HAYWARD PARK STATION PARKING LOT, SAN MATEO, CALIFORNIA

Dear Mr. Chao:

Our companion letter dated April 18, 2018, indicated a discharge of waste[1] (chiefly diesel and motor oil range hydrocarbons) appears to have occurred at the subject property. The extent and stability of this contamination, its impact on human health and environment, and the remedial measures necessary to protect health and environment have not been determined.

San Mateo County Environmental Health (Environmental Health) has assumed the role as regulatory oversight agency for the characterization and potential remediation of the released waste as allowed by Section 101480 of the California Health and Safety Code. At this time, PCJPB is choosing to meet the legal definition of a responsible party (RP)[2] for this release. However, PCJPB is not admitting to any liability associated with the waste release. PCJPB is only agreeing to determine the extent, stability, and impact of the contamination; whether it poses a significant risk to human health and the environment; and if so, to implement actions to remediate and mitigate these risks and protect the beneficial uses of groundwater. By entering into this Remedial Action Agreement, PCJPB agrees to the following conditions:

- All subsequent directives and written agreements from Environmental Health regarding testing, monitoring, and analysis to determine the nature, extent, and risk of the contamination, cleanup goals, potential remedial actions, and the deadlines for required submittals, are collectively referred to as Corrective Action and will be considered part of this Remedial Action Agreement.

---

1 - Waste as defined California Health and Safety Code Section 101075 and Water Code Section 13050
2 - Responsible Party as defined California Health and Safety Code Sections 25260 and 101480

- All Corrective Action activities will follow San Mateo County Groundwater Protection Program Guidelines, Policies and Procedures available at www.smchealth.org/gpp unless deviations are justified. Regardless of the level of oversight from Environmental Health, the RP is responsible for the timely reporting, investigation, and cleanup of soil and groundwater pollution to the extent necessary to protect human health and the environment and protect the beneficial uses of the waters of the State. The RP is also responsible for complying with all appropriate laws, regulations and policies, including new laws or regulations that become applicable during the term of this agreement.

- If, at any time, the RP is not in compliance with directives from Environmental Health that constitute a portion of this Remedial Action Agreement, then Environmental Health may withdraw from the agreement with 15 days notice. The RP can also withdraw from the agreement with 15 days notice (or less with written approval from Environmental Health). If the agreement is terminated prior to adequate completion of the Remedial Action Agreement directives, then Environmental Health will transfer the case to the San Mateo County Unified Program Agency (UPA), if applicable, or refer the case to the Department of Toxic Substances Control (DTSC) or Regional Water Quality Control Board (RWQCB), as appropriate, for issuance of a State Corrective Action Order, Cleanup and Abatement Order, or other order or enforceable agreement.

- If upon further site characterization, Environmental Health determines the release of waste that is the subject of this Remedial Action Agreement is sufficiently complex, may present a significant potential hazard to human health or the environment, or may not be in the best interest of the County to continue as lead agency, then Environmental Health may refer the case to the DTSC or RWQCB for further action.

- Pursuant to Section 25262 of the California Health and Safety Code, the RP may request the designation of an administering or lead agency other than Environmental Health when required to conduct Corrective Action. Please contact Environmental Health for further information about this process if this option is preferred.

- This case is subject to California regulations for electronic submittal of information for all soil and groundwater cleanup cases (California Code of Regulations Title 23, Division 3, Chapter 30, Articles 1 and 2, and Title 27, Division 3, Subdivisions 1 and 2). All required submittals must be uploaded to the State of California GeoTracker database (GeoTracker) in accordance with State Water Resources Control Board requirements by the reporting deadlines specified by Environmental Health. No paper copy submittals of Corrective Action work plans and reports are required.

- After determining the RP has completed the actions required by the Remedial Action Agreement, Environmental Health will provide the RP a letter certifying the cleanup goals embodied in the Remedial Action Agreement have been accomplished and that no further action is required.

- As allowed by Section 101490 of the Health and Safety Code, Environmental Health will invoice the RP to recover the reasonable and necessary costs for oversight of the identified release up to and including the implementation of this Remedial Action Agreement. Approximately 4 hours have already been worked and will be included on the first invoice. Environmental Health staff time is invoiced quarterly at the rate specified in the County Fee Ordinance (the current billing rate is $198/hour). This amount does not include fees for obtaining required permits (e.g. subsurface drilling permits). If invoices are not paid as specified on the invoice, then a 25% penalty may be charged. Failure to pay invoices may result in assignment of the charges to County Revenue Services for legal collections and potential termination of this Remedial Action Agreement. It is the sole responsibility of the RP to promptly notify the Environmental Health caseworker of any change in contact information. Failure to provide adequate notice of any change in contact information will not be considered an acceptable reason for waiving late payment penalties.

Please sign and date below and return one copy of this Remedial Action Agreement in the enclosed envelope. If we do not receive a signed copy of this agreement by **June 12, 2018**, then Environmental Health may transfer the subject case to the San Mateo County Corrective Action UPA Program, if appropriate, or refer this case to the DTSC and RWQCB for their oversight. Please contact Deno Milano (Environmental Health caseworker) at 650-372-6292 or dmilano@smcgov.org if you have questions.

Sincerely,

Heather Forshey

Importance: High

Hi Stephen. On 6/19/18 you left me a voice mail message indicating you are still working on getting me an additional assessment report from the developer that our agency may not have. We have not received the report. More importantly, the PCJPB has not signed and returned to us the remedial action agreement (RAA) we mailed to you on 4/18/18. Please note, if we do not received a signed copy of the RAA by 7/31/18, then we'll have to refer this case to the RWQCB and DTSC.

I have uploaded all pertinent correspondence and reports to GeoTracker. The site is listed under the address of 0 Concar Drive, San Mateo.

SUBJECT: PETROLEUM ADJACENT TO NORTHEAST SIDE OF HAYWARD PARK CALTRAIN STATION PARKING LOT, SAN MATEO, CALIFORNIA

Dear Mr. Chao:

You left me a voice mail message on June 19, 2018, indicating the PCJPB is still working on providing me additional report(s) on the assessment work performed by the developer adjacent to the subject site. San Mateo County Groundwater Protection Program staff have not received any additional information since that date. Therefore, please upload to GeoTracker by **December 21, 2018**, a work plan detailing and justifying a scope of work to assess the lateral and vertical extent of the contamination at the subject site. Any data received from the developer in the interim can be incorporated into the work plan to potentially reduce the scope of work.

Please contact me at 650-372-6292 (direct), 650-372-6200 (main), or at dmilano@smcgov.org if you have any questions. I'm available Monday through Thursday, excluding holidays.

Sincerely,

Deno G. Milano, PG

RECORD OF TELEPHONE CONVERSATION

DATE: 12/19/18 (~3PM)

CASE: Hayward Park CalTrain Station, San Mateo (Case #119191 / RO2243)

BETWEEN: Stephen Chao (RP's representative) and Deno Milano (GPP)

RE: GPP Work Plan Request

Stephen said he is unable to submit the required work plan by deadline tomorrow. GPP did not consider an extension warranted because the project file indicates CalTrain has had sufficient time to prepare the work plan. GPP reminded Stephen that we first brought this issue to CalTrain's attention in January 2016. Stephen felt the contamination originated from offsite sources, but he has not provided any information to GPP staff. GPP stated that if the RP does not consider the work required by GPP staff necessary, then the RP must justify why this is the case within 30 days of receiving our directive letter to perform the work.

Note – Stephen has informed GPP staff since at least 5/2/18 that CalTrain is aware of additional assessment information they are trying to obtain. However, nothing has been reported to GPP staff. GPP suggested we be made aware of what the additional data is because if it involved drilling below approximately 5 feet below grade, then the person doing the work would have had to obtain a drilling permit from us and the permit requires that person to submit the results of the investigation to us.

SUBJECT: PETROLEUM CONTAMINATION BENEATH PARKING LOT OF CALTRAIN HAYWARD PARK STATION, 401 CONCAR DRIVE, SAN MATEO, CALIFORNIA

Dear Mr. Chao:

ERM uploaded to the State GeoTracker database a work plan for additional assessment dated January 4, 2018 (sic). The following comments are based on San Mateo County Groundwater Protection Program (GPP) staff review of the work plan and the project file.

The work plan contains hereto unreported soil and groundwater sampling results from a May 2016 investigation performed at the subject site. GPP staff cannot fully evaluate the value of these results because many soil samples were not analyzed from the depth of previously identified significant TPH impact (approximately 5, 9, and 12 feet below grade [fbg]) and the boring logs and details of groundwater sample collection were not provided. Therefore, the isoconcentration maps provided in Attachment 1 may not provide an accurate portrayal of site conditions. Please note, Conditions E and F of Permit 16-0793 issued for the May 2016 sampling required the permittee to submit to us the analytical results, boring logs, and site plans within 60 days of the sampling.

The work plan indicates the Peninsula Corridor Joint Powers Board (PCJPB) plans to redevelop the subject site into a mixed commercial residential property with subterranean parking, and therefore, only proposes at this time to determine if the contamination extends offsite. GPP staff need to know the location and use of the planned redevelopment structures and the proposed depth of the proposed subterranean parking garage to estimate if redevelopment will likely remove the lateral and vertical extent of onsite contamination. Unless the parking garage will extend across the entire site, the limited TPH soil sampling data from 5, 9, and 12 fbg makes it difficult to estimate the lateral extent of onsite TPH impact. It also appears the parking garage would have to extend to approximately 15 fbg to remove the vertical extent of contamination based on the soil sampling results from B-30. However, this is only an estimate because only a few soil samples have been collected below 12 fbg.

GPP staff would consider postponing onsite remediation until site redevelopment occurs if the contamination is not migrating or posing a current risk to human health or the environment. However, we would only support a finite postponement because planned redevelopment projects are not always implemented. Therefore, please upload to GeoTracker by **April 11, 2019**, a letter indicating the year of planned re-development and, if known, the location and use of the planned structures and the depth of the proposed subterranean parking garage.

GPP staff approve the work plan with the following conditions:

- Base the selection of soil samples for analysis on sample screening (visual and photoionization detector), the depth to groundwater, stratigraphy, the depth of previously identified impacts, and the need to also assess the vertical extent of contamination (e.g. analyzing a soil sample from the contact between a sand and an underlying clay where potential surface spills from the asphalt batch plant may have accumulated and additionally analyzing soil samples from 5, 9, and 12 fbg to assess the lateral extent of contamination). Ensure a sufficient number of samples are analyzed to demonstrate the lateral and vertical extent of the contamination is assessed (i.e. do not limit drilling depth or the number of samples analyzed to a preset value or simply analyze soil samples at 5-foot-intervals);

- Consider drilling additional borings to assess the onsite data gaps we previously identified in the May 2016 assessment work (i.e. lack of soil samples from 5,9, and 12 fbg and the lack of vertical assessment in some areas such as W-14);

- Consider drilling additional borings west of W-12 and W-14 to assess if petroleum contamination from the Vail Oil and Burner site west of W-13 (SMCo # 110049 at 1741 Leslie Street) is migrating onto the subject site. Impacted groundwater migrating onto the subject site or impinging against the subsurface portion of planned structures could pose potential vapor intrusion and groundwater disposal concerns. Please also verify the location of the former asphalt mixing plant shown on Figure 2 using the 1961 Sanborn Map and whether the petroleum concentrations reported in W-6 and Station Green sampling localities RE3 and B-30 (approximately between W-8 and W-10) represent separate source areas;

- Ensure borings drilled to sample first groundwater are not driven too deep into the saturated zone. A maximum drilling depth of 8 fbg appears appropriate for sampling first groundwater based on the 3 to 6 fbg depth to groundwater reported in the former groundwater monitoring wells at the Vail Oil and Burner site. The proposed use of a direct-push drilling rig in fine-grained soils could make it difficult to detect groundwater and significantly lengthen the time for groundwater to accumulate in the borehole. Therefore, please protect the borings from surface runoff until groundwater samples can be collected;

- Also analyze the soil samples for naphthalene and additionally analyze the soil samples containing elevated TPH-oil concentrations for semi-volatile organic compounds. Any analysis performed with a silica gel cleanup must also be performed without the cleanup

per Regional Water Quality Control Board requirements. It also may be prudent to evaluate the chromatograms of current and former diesel analysis to determine if the diesel results appear to represent diesel or oil/asphalt;

- Backfill the borings containing groundwater by pumping Portland cement grout through a tremie pipe extending to the bottom of the boring until the groundwater in the boring is displaced out of the boring (pouring grout into a funnel placed on top of the tremie pipe is not acceptable unless the boring is dry and <30-feet-deep). Mix the grout at a ratio of 94 pounds of Portland cement to 6 to 7 gallons of water; and

- Upload to GeoTracker by **June 10, 2019**, all electronic files required by California Code of Regulations Title 23, Division 3, Chapter 30, including a report detailing and justifying the methods, findings, conclusions, and recommendations of the investigation.

The report must indicate how investigative derived wastes were disposed offsite and include scaled figures (base-10 preferred) and data analytical tables sufficient to support conclusions regarding contaminant extent, stability, and risk. Please include at least one figure identifying all sampling locations to date and tables summarizing the laboratory results of all soil, groundwater, and vapor sampling analyses performed to date (one table for soil, one for groundwater, and one for vapor is preferred). Each table should include the date and depth of sample collection, as appropriate, and the proper field point name (FPN). FPNs must be consistent between text, figures, tables, and boring logs.

Closing Comments

The May 2016 soil sampling results from W-16 and W-17 suggest lead is also a concern in the southeast portion of the subject site. The soil and groundwater management plan we will require and approve prior to site redevelopment will have to also address the lead contamination.

The TPH-g reported in the groundwater sample collected from Boring B12 near the property line between the Station Green and PCJPB parcels is a potential concern and does not appear likely to have originated from the former Shell station approximately 600 feet northeast. Although the TPHg results from the analysis of the groundwater samples collected from W-21 and B-31 through B-33 were below acceptable laboratory reporting limits, GPP staff cannot evaluate the usefulness of these results because the boring logs and groundwater sampling details for Borings W-21, B-3, and B-12 have not been submitted to GPP staff. For example, if the groundwater results from Boring B-12 are representative of first groundwater (unknown at this time), then the 20 to 30 fbg sampling depth in B-31 through B-33 was too deep to assess the lateral extent of the TPH impact in B-12 unless the sample from B-12 was collected from the same sampling interval. GPP staff will require the property owner, boring owner, and consultant for the Station Green site to submit the analytical results, boring logs, and site plan for Borings B-1 through B-17.

Please contact me at 650-372-6292 (direct), 650-372-6200 (main), or at dmilano@smcgov.org if you have any questions. I'm available Monday through Thursday, excluding holidays.

Sincerely,

SUBJECT: ENVIRONMENTAL ASSESSMENT AT THE STATION GREEN DEVELOPMENT, WESTERN CORNER OF S. DELAWARE STREET AND CONCAR DRIVE, SAN MATEO, CALIFORNIA

Dear Mr. Wurzelbacher and Mr. Berger:

Numerous borings have been drilled at the subject site to investigate environmental conditions prior to site redevelopment. However, it does not appear San Mateo County Groundwater Protection Program staff ever received the environmental information required by the drilling permits. The drilling permits require you to submit this information within 60 days of drilling. Therefore, please **immediately** submit to my attention the following information for all drilling work performed at the subject site: 1) scaled as-build site plan(s) showing the sampling locations; 2) boring logs; and 3) the analytical results. Submitting a pdf version of the applicable assessment reports is acceptable if more convenient.

Please contact me at 650-372-6292 (direct), 650-372-6200 (main), or at dmilano@smcgov.org on Monday through Thursday (excluding holidays) if you have any questions.

EXECUTIVE SUMMARY

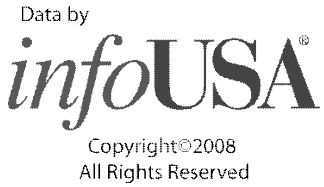
DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Report is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Report includes a search of available city directory data at 5 year intervals.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.



RESEARCH SUMMARY

The following research sources were consulted in the preparation of this report. A check mark indicates where information was identified in the source and provided in this report.

Year	Target Street	Cross Street	Source

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by WEST were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Daily Journal Quick Poll

What do you think of Gov. Jerry Brown's proposal to raise the sales tax by half a percent and increase taxes on those making more than $250,000 a year?

- Good ideas, we could use the money
- Like the taxes on the wealthy, but not the sales tax
- Don't like either
- Not sure, but glad he's asking voters

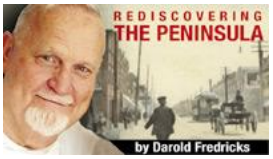
From Leslie Salt to Cargill

July 14, 2008, 12:00 AM



Salt, one of the most basic chemicals needed for the human body, is not always easy to obtain. Animals and man migrate miles to find salt and cities like Timbuktu have become famous for their supplies.

Salt has been used for payment of debts and also paid out to workers (hence the word “salary”). Places where salt was available across the United States, salt licks, were noted on maps of the early pioneers because of the precious nature of the substance.

The California salt industry started in the 1850s when some salt was placed on the market, but we know the Indians, Spanish and Mexicans gathered salt for their use out of natural tide pools that abounded in Alameda County before this.

It had to have tasted bitter and terrible as it could not have been over 99.63% pure sodium chloride. We now demand 99.9% pure salt for our use in our homes, and this technological refinement method did not come until the latter part of the 1800s. In fact most of the pure salt for table use was imported from Liverpool, England, until the middle 1880s.

The salt collected by the first salt entrepreneur in the East Bay, John Johnson, sold for $50 a ton and it was used mainly for the chemical separation of silver from its impurities in the Comstock Lode in Nevada.

Seeing the potential in salt collecting in the East Bay marshes, many others jumped in and developed salt collectors and the price dropped to $3 a ton. Dozens of small operators, with less than 20 acres, developed the marshes along the East Bay to Newark where favorable winds and weather conditions produced thousands of tons of salt per year.

In 1903, C. E. Whitney, a dredger by trade, bought 200 acres of land south of Alvinza Hayward’s property, east of the railroad tracks in San Mateo and developed a salt-evaporating business. The railroad that ran through San Mateo was ideal for transporting the bulky material to the market and there was a cheap, abundant labor supply in the area that would work for the $5.40 he paid for the six-day workweek.

The work was demanding. A large workforce was needed because everything was lifted with shovels and moved in wheelbarrows. It was backbreaking work and mainly Japanese were used for this business in San Mateo.

The company started by C. E. Whitney was named the Leslie Salt Refining Co., but changed to Leslie-California Salt Company in 1924 after many consolidations occurred with other companies. The history of the salt industry in the Bay Area is one of absorption of the inefficient and undercapitalized small companies that were usually started by one man and were run as a family operation. Dozens of these companies would be taken over until only a few, like Leslie Salt, survived in the 1940s.

In 1910, Leslie Salt improved the quality of its salt to 99.9% by use of the evaporative method of refinement and their marketing strategy overwhelmed their competitors. By 1919 they were harvesting 25,000 tons yearly.

Redwood City began developing their waterway of the Redwood Creek into a deep water port in the 1920s. Leslie Salt acquired more than 40,000 acres of tideland north and south of Redwood City and much of this area was used for the evaporation of salt. In the 1930s August Schilling took over the Leslie Salt Company, retained its name and closed the San Mateo operation after consolidating its offices and operations in Redwood City. Now the company was processing 300,000 tons of salt a year and employed 300 workers. Ten years later Leslie was producing 450,000 tons of salt on 25,000 acres.

Arden Salt, which owned marshland to the west of Alviso, was merged with Leslie in 1936. Additional marshland was acquired around Redwood City in 1940, and a new plant with ship-loading facilities was developed. In 1948 Leslie sold its interests in salt-producing to Cargill Salt.

Due to environmental concerns, silting of the Bay and population pressures, Cargill ceased production of unprocessed industrial salts in the Redwood City facility in 2006 and removed its huge salt pile.

Rediscovering the Peninsula appears in the Monday edition of The Daily Journal.

SAN MATEO.—The Whitney Chemical Company has commenced the manufacture of epsom salts, magnesium chloride and potassium chloride from sea water at San Mateo, Cal. The company is working in conjunction with the Leslie Salt Refining Company. Seawater is evaporated in ponds and the salt removed, and the potassium and magnesium salts are obtained from the remaining liquor.
