GLOSSARY

General Building Department concepts

- **ICC:** The International Code Council. The governing body for the building/development codes used by all jurisdictions who've adopted the ICC guidelines. MOST of the US has done this. Canada, Mexico, and other countries use ICC codes books and guides as well. There are a few states who have added guidelines to the ICC codes to better fit their needs. For example, California has added seismic retrofit requirements for most commercial structures.
- **Building Department (Permitting Authority, Building Codes, Inspections Department, Building and Inspections):** This is the department in a jurisdiction where an owner or contractor goes to obtain permits and inspections for building, tearing down, remodeling, adding to, re-roofing, moving or otherwise making changes to any structure, Residential or Commercial.
- **Jurisdiction:** This is the geographic area representing the properties over which a Permitting Authority has responsibility.
- **GC:** General Contractor. Usually the primary contractor hired for any Residential or Commercial construction work.
- **Sub:** Subordinate contracting companies or subcontractors. Usually a "trades" contractor working for the GC. These contractors generally have an area of expertise in which they are licensed like Plumbing, Electrical, Heating and Air systems, Gas Systems, Pools etc. (called "trades").
- **Journeymen:** Sub contractors who have their own personal licenses in one or more trades and work for different contracting companies, wherever they are needed or there is work.
- **HVAC (Mechanical, Heating & Air companies):** HVAC = Heating, Ventilation, and Air Conditioning.
- **ELEC (Electrical, TempPole, TPole, TPower, Temporary Power, Panel, AMP Change, Power Release):** Electrical permits can be pulled for many reasons. The most common reason is to increase the AMPs of power in an electrical power panel. This requires a permit in almost every jurisdiction. Other commons reason for Electrical permits is to insert a temporary power pole at a new construction site. Construction requires electricity, and in a new development, power has yet to be run to the lot. The temporary power pole is usually the very first permit pulled for new development. The power is released to the home owner when construction is complete and this sometimes takes the form of a Power Release permit or inspection.
- **"Pull" a permit:** To obtain and pay for a building permit.
- **CBO:** Chief Building Official
- **Planning Department:** The department in the development process where the building /structural plans are reviewed for their completeness and compliance with building codes
- **Zoning Department:** The department in the development process where the site plans are reviewed for their compliance with the regulations associated with the zoning district in which they are situated.
- **Zoning District:** A pre-determined geographic boundary within a jurisdiction where certain types of structures are permitted / prohibited. Examples are Residential structure, Commercial/Retail structures, Industrial/Manufacturing structures etc. Each zoning district has regulations associated with it like the sizes of the lots, the density of the structures on the lots, the number of parking spaces required for certain types of structures on the lots etc.
- **PIN (TMS, GIS ID, Parcel#):** Property Identification Number and Tax Map System number.
- **State Card (Business license):** A license card issued to a contractor to conduct business.
- **Building Inspector (Inspector):** The inspector is a building department employee that inspects building construction for compliance to codes.
- **C.O.:** Certificate of Occupancy. This is the end of the construction process and designates that the owners now have permission to occupy a structure after its building is complete. Sometimes also referred to as a Certificate of Compliance.

GLOSSARY

Permit Content Definitions

- Permit Number: The alphanumerical designation assigned to a permit for tracking within the building department system. Sometimes the permit number gives clues to its role, e.g. a "PL" prefix may designate a plumbing permit.
- Description: A field on the permit form that allows the building department to give a brief description of the work being done. More often than not, this is the most important field for EP's to find clues to the prior use(s) of the property.
- Permit Type: Generally a brief designation of the type of job being done. For example BLDG-RES, BLDG-COM, ELEC, MECH etc.

Sample Building Permit Data

Date: Nov 09, 2000
Permit Type: Bldg -
New Permit Number: 101000000405
Status: Valuation: $1,000,000.00
Contractor Company: OWNER-BUILDER
Contractor Name:

Description: New one store retail (SAV-ON) with drive-thru pharmacy. Certificate of Occupancy.

EDR Environmental Lien and AUL Search

The EDR Environmental Lien Search Report provides results from a search of available current land title records for environmental cleanup liens and other activity and use limitations, such as engineering controls and institutional controls.

A network of professional, trained researchers, following established procedures, uses client supplied address information to:

- search for parcel information and/or legal description;
- search for ownership information;
- research official land title documents recorded at jurisdictional agencies such as recorders' offices, registries of deeds, county clerks' offices, etc.;
- access a copy of the deed;
- search for environmental encumbering instrument(s) associated with the deed;
- provide a copy of any environmental encumbrance(s) based upon a review of key words in the instrument(s) (title, parties involved, and description); and
- provide a copy of the deed or cite documents reviewed.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

LOCATION CODE - *OPTIONAL*	CENSUS TRACT # - *OPTIONAL*	SUPVISOR - DISTRICT CODE - *OPTIONAL*

THIS FORM MUST BE ACCOMPANIED BY AT LEAST (1) OR MORE PERMIT APPLICATION - FORM B, UNLESS THIS IS A CHANGE OF SITE INFORMATION ONLY.

FORM A (9-90) FOR0033A-R2

INSTRUCTIONS FOR COMPLETING FORM "A"

GENERAL INSTRUCTIONS:

1. One FORM "A" shall be completed for all **NEW PERMITS, PERMIT CHANGES** or any **FACILITY/SITE INFORMATION CHANGES.**
2. **SUBMIT ONLY ONE (1) FORM "A"** for a Facility/Site, regardless of the number of tanks located at the site.
3. This form should be completed by either the PERMIT **APPLICANT** or the **LOCAL AGENCY UNDERGROUND TANK INSPECTOR.**
4. Please type or print clearly all requested information.
5. Use a hard point writing instrument, you are making 3 copies.

TOP OF FORM: "MARK ONLY ONE ITEM"

1. Mark an (X) in the box next to the item that best describes the reason the form is being completed.

I. FACILITY/SITE INFORMATION & ADDRESS (MUST BE COMPLETED)

1. Record name and address (physical location) of the underground tank(s).
   NOTE: Address MUST have a valid physical location including city, state, and zip code.
   P.O. BOX NUMBER ARE NOT ACCEPTABLE.
   Include nearest cross street and name of the operator.
2. Phone number must have an area code. If the night number is the same, write "SAME" in proper location.
3. Check the appropriate box for TYPE OF BUSINESS OWNERSHIP (ex. CORPORATION, INDIVIDUAL, etc.)
4. Check the appropriate box for TYPE OF BUSINESS.
5. If Facility/Site is located on land within an indian reservation or other indian trust lands, check the box marked "YES".
6. Indicate the NUMBER of TANKS at this SITE.
7. Record the E.P.A. ID # or write "NONE" in the space provided.

II. PROPERTY OWNER INFORMATION & ADDRESS (MUST BE COMPLETED)

1. Complete all items in this section, unless all items are the same as SECTION I; if the same, write **"SAME AS SITE"** across this section. Be sure to check PROPERTY OWNERSHIP TYPE box.

III. TANK OWNER INFORMATION & ADDRESS (MUST BE COMPLETED)

1. Complete all items in this section, unless all items are the same as SECTION 1; If the same, write **"SAME AS SITE"** across this section. Be sure to check **TANK OWNERSHIP TYPE** box.

IV BOARD OF EQUALIZATION UST STORAGE FEE ACCOUNT NUMBER (MUST BE COMPLETED)

Enter your Board of Equalization (BOE) UST storage fee account number which is required before your permit application can be processed. Registration with the BOE will ensure that you will receive a quarterly storage fee return in reporting the $0.006 (6 mills) per gallon fee due on the number of gallons placed in your USTs. The BOE will code persons exempt from paying the storage fee so returns will not be sent. If you do not have an account number with the BOE or if you have any questions regarding the fee or exemptions, please call the BOE at 916-739-2582 or write to the BOE at the following address: Board of Equalization, Environmental Fees Unit, P.O. Box 942879, Sacramento, CA 94279-0001.

V. LEGAL NOTIFICATION AND BILLING ADDRESS

1. Check **ONE BOX** for the address that will be used for **BOTH LEGAL AND BILLING NOTIFICATIONS.**

APPLICANT MUST SIGN AND DATE THE FORM AS INDICATED.

INSTRUCTION FOR THE LOCAL AGENCIES

The county and jurisdiction numbers are predetermined and can be obtained by calling the State Board (916)739-2421. The facility number may be assigned by the local agency; however, this number must be numerical and cannot contain an alphabet. If the local agency prefers the State Board to assign the facility number, please leave it blank.

IT IS THE RESPONSIBILITY OF THE LOCAL AGENCY THAT INSPECTS THE FACILITY TO VERIFY THE ACCURACY OF THE INFORMATION. THIS APPLICATION CANNOT BE PROCESSED IF THE BOE ACCOUNT NUMBER IS NOT FILLED IN. THE LOCAL AGENCY IS RESPONSIBLE FOR THE COMPLETION OF THE "LOCAL AGENCY USE ONLY" INFORMATION BOX AND FOR FORWARDING ONE FORM "A" AND ASSOCIATED FORM "B"(s) TO THE FOLLOWING ADDRESS.

INSTRUCTIONS FOR COMPLETING FORM "B"

GENERAL INSTRUCTIONS:

1. One FORM "B" shall be completed for each tank for all **NEW PERMITS, PERMIT CHANGES, REMOVALS** and/or any other **TANK INFORMATION CHANGE.**
2. This form should be completed by either the **PERMIT APPLICANT** or the **LOCAL AGENCY UNDERGROUND TANK INSPECTOR.**
3. Please type or print clearly all requested information.
4. Use a hard point writing instrument, you are making 3 copies.

TOP OF FORM: "MARK ONLY ONE ITEM"

1. Mark an (X) in the box next to the item that best describes the reason the form is being completed.
2. Indicate the DBA or Facility name where the tank is installed.

I. TANK DESCRIPTION - COMPLETE ALL ITEMS - IF UNKNOWN - SO SPECIFY

A. Indicate owners tank ID # - If there is a tank number that is used by the owner to identify the tank (ex. AB70789).
B. Indicate the name of the company that manufactured the tank (ex. ACME TANK MFG.).
C. Indicate the year the tank was installed (ex. 1987).
D. Indicate the tank capacity in gallons (ex. 25,000 or 10,000 etc.).

II. TANK CONTENTS

A. 1. If MOTOR VEHICLE FUEL, check box 1 and complete items B & C.
   2. If not MOTOR VEHICLE FUEL, check the appropriate box in section A and complete items B & D.
B. Check the appropriate box.
C. Check the type of MOTOR VEHICLE FUEL (if box 1 is checked in A).
D. Print the chemical name of the hazardous substance stored in the tank and the C.A.S.#. (Chemical Abstract Service number), if box 1 is NOT checked in A.

III. TANK CONSTRUCTION - MARK ONE ITEM ONLY IN BOX A, B, C & D

1. Check only one item in TYPE OF SYSTEM, TANK MATERIAL, INTERIOR LINING and CORROSION PROTECTION.
2. If OTHER, print in the space provided.

IV. PIPING INFORMATION

1. Circle A if above ground; circle U if underground; and circle both if applicable.
2. If UNKNOWN, circle; or if OTHER, print in space provided.
3. Indicate the LEAK DETECTION system(s) used to comply with the monitoring requirement for the piping.

V. TANK LEAK DETECTION

1. Indicate the LEAK DETECTION system(s) used to comply with the monitoring requirements for the tank.

VI. INFORMATION ON TANK PERMANENTLY CLOSED IN PLACE

1. ESTIMATED DATE LAST USED - MONTH/YEAR (January, 1988 or 01/88).
2. ESTIMATED QUANTITY of HAZARDOUS SUBSTANCE remaining in the tank (in Gallons).
3. WAS TANK FILLED WITH INERT MATERIAL? Check 'Yes' or 'NO'.

APPLICANT MUST SIGN AND DATE THE FORM AS INDICATED.

INSTRUCTION FOR THE LOCAL AGENCIES

The state underground storage tank identification number is composed of the two digit county number, the three digit jurisdiction number, the six digit facility number and the six digit tank number. The county and jurisdiction numbers are predetermined and can be obtained by calling the State Board (916)739-2421. The facility number must be the same as shown in form "A". The tank number may be assigned by the local agency; however, this number must be numerical and cannot contain an alphabet. If the local agency prefers the State Board to assign the tank number, please leave it blank.

IT IS THE RESPONSIBILITY OF THE LOCAL AGENCY THAT INSPECTS THE FACILITY TO VERIFY THE ACCURACY OF THE INFORMATION. THE LOCAL AGENCY IS RESPONSIBLE FOR THE COMPLETION OF THE "LOCAL AGENCY USE ONLY" INFORMATION BOX AND FOR FORWARDING ONE FORM "A" AND ASSOCIATED FORM "B"(s) TO THE FOLLOWING ADDRESS.

Dear Tank Owner:

A recent review of your file has indicated that your facility has not been issued a Final Permit To Operate Hazardous Materials Underground Storage Tanks. In order to obtain a permit to operate, you must submit the following items within 30 days:

✓ State Water Resources Control Board Forms A&B

✓ Current test results for:
- ✓ Tanks
- ✓ Piping
- ___ Leak detectors
- ___ Dispenser meter calibration
- ___ Soil and/or water samples from previous tank removal
- ___ Quarterly monitoring well sampling

✓ Written Monitoring Plan for Underground Tank System

___ Response Plan for removal of product from secondary containment

✓ Quarterly Inventory Reconciliation Forms

✓ Change of Ownership Information

This tank excavation report is submitted to you for your files. SEMCO will document the removal and excavation of the tanks from the site. SEMCO will provide sampling locations, site logs where applicable and deliver detailed analytical reports with chain of custody procedures. Finally, SEMCO will supply manifests for the disposal of the tanks as well as appropriate gas free certificates and documentation for final destination of the tank.

This property is located at 167-17th Avenue., San Mateo

REMOVAL AND DISPOSAL OF FUEL STORAGE TANK.

One underground fuel storage tank was excavated and removed from the site on March 18, 1992. Tank abandonment was performed by SEMCO, contractors License Number 449864, Classification A,B,C - 61 / D 40. The tank contents were as follows:

1-550 Gasoline

It was determined that the tank was dry before removal procedures were begun. Solid carbon dioxide (dry ice) was placed in the tank after a water rinse before removal to eliminate any explosive vapors that may have existed. Soil samples were collected with a drive sampler, contained in sealed brass tubes, labeled, then stored in an iced container. Chain of Custody procedures were observed and are included herein.

On March 18, 1992. SEMCO delivered the samples to Superior Analytical Laboratories, Inc. in San Francisco, California for analysis. SEMCO requested the laboratory to analyze samples from the base of the excavation for total petroleum hydrocarbons as gasoline, total lead and BTXE.

Transportation and off site disposal of the tank, was accomplished by Rich Hamilton Trucking, 431 W. Hatch Road, Modesto. On March 23, 1992, the tank was then taken to Erickson, Inc. for disposal, manifest # 90710697.

SEMCO is pleased to present this tank excavation report to you for your file. We would, of course, be happy to answer any questions you may have. Thank you for allowing SEMCO to complete this tank removal. We look forward to working with you again.

PERMITS

ENVIRONMENTAL HEALTH PERMIT

San Mateo County Department of Health Services
590 Hamilton Street, Redwood City, CA 94063

Permit to Abandon Underground Hazardous Material
(1tk @ 750 gal)

At 167 17th Ave. S.M.

No.	HM-457-92
Date	2/28/92
Fee paid	$344.00
APN	S110150
Ordinance No.	02865

issued by E.Montufar

This permit has been granted to:
Owner
Harry J Hardy
61 Divenshire Circle
San CArlos, CA 94070

Contractor:
SEMCO
1741 Leslie St
San Mateo, Ca 94402

prepared by K.Chavez

For the Director of
Environmental Health

THIS PERMIT IS NONTRANSFERABLE AND MUST BE ON JOB SITE
Permit shall be void if construction is not started
within 90 days of date of this permit.

CERTIFICATE

CERTIFIED SERVICES COMPANY

255 Parr Boulevard • Richmond, California 94801

NO. 09052

CUSTOMER	SEMCO
JOB NO.	78061

FOR: Erickson, Inc. TANK NO. 8259

LOCATION: Richmond DATE: 03/20/92 TIME: 14:59:34

TEST METHOD Visual Gastech/1314 SMPN LAST PRODUCT UG

This is to certify that I have personally determined that this tank is in accordance with the American Petroleum Institute and have found the condition to be in accordance with its assigned designation. This certificate is based on conditions existing at the time the inspection herein set forth was completed and is issued subject to compliance with all qualifications and instructions.

TANK SIZE: 550 Gallon Tank CONDITION: SAFE FOR FIRE

REMARKS: OXYGEN 20.9%

LOWER EXPLOSIVE LIMIT LESS THAN 0.1%

"ERICKSON INC. HEREBY CERTIFIES THAT THE ABOVE NUMBERED TANK HAS BEEN CUT OPEN, PROCESSED, AND THEREFORE DESTROYED AT OUR PERMITTED HAZARDOUS WASTE FACILITY."

In the event of any physical or atmospheric changes affecting the gas-free conditions of the above tanks, or if in any doubt, immediately stop all hot work and contact the undersigned. This permit is valid for 24 hours if no physical or atmospheric changes occur.

STANDARD SAFETY DESIGNATION

SAFE FOR MEN: Means that in the compartment or space so designated (a) The oxygen content of the atmosphere is at least 19.5 percent by volume; and that (b) Toxic materials in the atmosphere are within permissable concentrations; and (c) In the judgment of the Inspector, the residues are not capable of producing toxic materials under existing atmospheric conditions while maintained as directed on the Inspector's certificate.

SAFE FOR FIRE: Means that in the compartment so designated (a) The concentration of flammable materials in the atmosphere is below 10 percent of the lower explosive limit; and that (b) In the judgment of the Inspector, the residues are not capable of producing a higher concentration that permitted under existing atmospheric conditions in the presence of fire and while maintained as directed on the Inspector's certificate, and further, (c) All adjacent spaces have either been cleaned sufficiently to prevent the spread of fire, are satisfactorily inerted, or in the case of fuel tanks, have been treated as deemed necessary by the Inspector.

The undersigned representative acknowledges receipt of this certificate and understands the conditions and limitations under which it was issued.

Inspector Montufar Date 2-27-92

PROCEDURE FOR THE REMOVAL OF UNDERGROUND STORAGE TANKS

1. Complete the "Application for Permit to Close Underground Hazardous Materials Storage Tank" (pages 1 & 2). Please complete one application per tank.

2. Contact the Local Fire and Building Agency for their policy regarding closure of underground storage tanks.

3. Submit the completed application, designated fee, written workmen's compensation insurance verification and plot plan drawing to the San Mateo County Environmental Health Services Division. The drawing should consist of an aerial view of the facility at which the tank(s) are located and should include the following information:

    a. Scale
    b. North arrow
    c. Property line
    d. Location of structures near the tank(s)
    e. Location of relevant existing equipment, including the tank(s) to be removed, associated piping, and fuel dispensers.
    f. Area roadways

    Also, submit State Water Resources Control Board Part A form for the facility, and Part B form for each tank closed. These forms are available from the Environmental Health Services Division.

4. In order to determine the extent of any contamination, soil and/or water samples must be taken from the excavation pit after the tank(s) are removed. Soil samples must also be taken every twenty (20) feet along piping runs at the interface of backfill material and native soil. Soil samples will be required to be taken from the excavation spoils pile (approximately one discrete sample per 20 cubic yards). The samples must be collected by a qualified, independent third party. All samples shall be protected against contamination and/or degradation during their collection, transport, and analysis. A written analysis report, including chain of custody documentation, and sample location map with measurements including depth, must be submitted to the Environmental Health Services Division within twenty (20) working days following removal of the tank(s). This report is subject to review and must be approved in order to be recognized as valid.

5. A groundwater investigation will be required if any of the following conditions exist or if a representative of the Environmental Health Services Division deems one necessary to assure that the public health and safety is protected:

    a. Soil contamination concentrations exceeding 100 ppm total petroleum hydrocarbons (TPH) or total oil and grease (TOG) within two feet of native soil beneath the tank.

    b. Detectable concentrations of petroleum hydrocarbon are found in soil at or below the seasonable high groundwater level.

    c. Detectable levels of any petroleum hydrocarbon in soil below the tank and the soil contains layers of sand, gravel and/or other high permeability material.

    d. Ground water in excavation pit has detectable levels of any petroleum hydrocarbon. (Pit may be pumped and allowed to recharge.)

    e. Site has history of leaks or tanks are in poor condition upon removal.

6. It must be demonstrated to a representative of the Environmental Health Services Division that residual product and any associated waste (i.e. sludge) have been removed from the interior of the tank(s) prior to purging. Documentation of proper disposal of residual product and associated waste using an Uniform Hazardous Waste Manifest (UHWM) must be submitted to the Environmental Health Services Division within twenty (20) working days following removal of the tank(s).

7. It must be demonstrated to a representative of the Environmental Health Services Division that tank(s) have been adequately purged and that no explosive hazard exists at the time of tank(s) removal i.e. 10% of lower Explosive Limit (% LEL) or 5% oxygen.

8. Underground tank(s) and associated piping removed from excavations must be shipped under UHWM to a permitted treatment, storage and disposal (TSD) facility or Class I landfill. Underground tanks may be cleaned using a high-pressure washer to reduce the % LEL. This process does not render these tank(s) non-hazardous and these tank(s) must be hauled under a hazardous waste manifest. Only tank(s) cleaned by a State Department of Health Services (DOHS) permitted tank cleaner may be disposed of as non-hazardous waste. Copies of all UHWM must be submitted to the Environmental Health Services Division within twenty (20) working days following removal of the tank(s).

9. Any piping associated with the tank(s) which is to remain underground must be flushed of all residual product and capped or sealed to the satisfaction of the Environmental Health Services Division.

10. Transported tanks must have all openings sealed, except for openings atop the tank fitted for ventilation with a "T" or other device which will preclude rain entering a stored tank.

11. The Environmental Health Services Division must be notified a minimum of twenty-four (24) hours prior to commencement of work to schedule an inspection. Please note that the inspection must be confirmed with the district inspector. A representative of this office must be present at the time of removal.

12. An additional $55.00 per hour will be charged for inspection time exceeding three hours.

THE ABOVE ARE GENERAL PROCEDURES - MODIFICATIONS MAY BE NECESSARY IN CERTAIN CASES. IF YOU HAVE ANY QUESTIONS, OR OTHERWISE NEED ASSISTANCE, PLEASE CALL THE SAN MATEO COUNTY ENVIRONMENTAL HEALTH SERVICES DIVISION AT (415) 363-4305.

I hereby certify that I have read and will follow the "Procedures for the Removal of Underground Storage Tanks"

Rhonda Reames-Kipin — 2/27/92

SUBJECT: Removal of Underground Storage Tank
167 17th Avenue, San Mateo, California

Dear Mr. Hardy:

This letter confirms the removal of one underground storage tank under San Mateo County permit number HM 457-92 at the subject site. With the provision that the information provided to this agency was accurate and representative of existing conditions, it is our position that no further action is required at this time.

Please be advised that this letter does not relieve you of any liability under the California Health and Safety Code or Water Code for past, present, or future operations at the site. Nor does it relieve you of the responsibility to clean up existing, additional, or previously unidentified conditions at the site which cause or threaten to cause pollution or nuisance or otherwise pose a threat to water quality or public health.

Additionally, be advised that changes in the present or proposed use of the site may require further site characterization and mitigation activity. It is the property owner's responsibility to notify this agency of any changes in report content, future contamination findings, or site usage.

Thank you for your cooperation in this matter. I may be reached at (415) 363-4420.

Sincerely,

F. Estuardo Montufar

SUBJECT: Underground Storage Tank
LOCATION: 167 17th Avenue, San Mateo, CA

Dear Tank Owner:

A recent review of your file has indicated that your facility has not been issued a Final Permit To Operate Hazardous Materials Underground Storage Tanks. In order to obtain a permit to operate, you must submit the following items within 30 days.

✓ State Water Resources Control Board Forms A&B

✓ Current test results for: Years 1986,87,88,89,90,91
- ✓ Tanks
- ✓ Piping
- ____ Leak detectors
- ____ Dispenser meter calibration
- ____ Soil and/or water samples from previous tank removal
- ____ Quarterly monitoring well sampling

✓ Written monitoring plan for underground tank system

____ Response plan for removal of product from secondary containment

✓ Quarterly inventory reconciliation forms

✓ Change of ownership information

The appropriate forms are being enclosed to assist you in complying with the above requirements. Upon receipt of all required information, a Permit To Operate will be issued to your facility which will be valid for five years. Be advised however, that failure to comply with the above requirements within the given time frame represent violations for which civil penalties carrying fines ranging from $500 to $5,000 per violation per day may be assessed.

Also, if your system utilizes pressurized piping, you must install in-line leak detectors by December 22, 1990. In addition, all single wall UST's must be replaced or upgraded to prevent releases due to corrosion, spills or overfills by December 22, 1998.

If you have any questions regarding the above requirements, you may contact me at (415) 363-4305.

Sincerely,

F. Estuardo Montufar

Mr. Harry J. Hardy
1055 Wilmington Way
Redwood City, CA 94062

Dear Mr. Hardy:

Ms. Linda Biagi, City of San Mateo Building Department, recently contacted me regarding your property at 167 17th Avenue, San Mateo. Ms. Biagi expressed her concern about an apparently unused underground fuel storage tank located on the southwest protion of the property.

In response to Ms. Biagi's call, I visited the property in question and observed that a tank was, indeed, present. It is my understanding that you intend to abandon the underground tank. If so, it is necessary that you complete and file the enclosed Application for Permit to Abandon Underground Hazardous Storage Tank. If, however, you wish to maintain the tank, it must be registered with the State of California and County of San Mateo, precision tested, and monitored for leakage as prescribed within Subchapter 16, Title 23 of the California Administrative Code.

I would be happy to answer any questions that you might have regarding the enclosed forms or state and/or county regulations regarding underground storage tanks. If I may be of assistance, please telephone me at (415) 363-4718. If you require no assistance, please complete and submit the appropriate one of the enclosed forms prior to October 1, 1986.

Sincerely,

John E. Rapp

Mr. F. Estuardo Montufar
Hazardous Materials Specialist II
County of San Mateo Department of Health Services
Environmental Health Services Division
590 Hamilton Street
Redwood City, California 94063

Dear Mr. Montufar:

Pursuant to our telephone conversation of December 26, 1991, I am sending the information you requested.

Ms. Florence Krebs was appointed a "Friend of the Court" successor conservator of the person and estate of Harry J. Hardy on November 22, 1991. At that time, she became aware of your letter dated November 8, 1991, advising Mr. Harry J. Hardy that the property he owned at 167 17th Avenue, San Mateo, California, contained an underground storage tank for which no permit had been issued. A hearing was held before Judge Veal at San Mateo Probate Court on January 3, 1992, wherein Ms. Krebs provided the Court with an initial status report on the properties owned by Mr. Hardy.

We have evidence of an underground tank (approximately a 750 gallon gasoline tank, located on the western edge of the property near the cyclone fence adjacent to the Mechanic's Union building) on the property at 167 17th Avenue, San Mateo. As you know, there is little information available about this storage tank. In a telephone conversation on December 27, 1991, Ms. Delores Lutter from your office indicated to me that one tank on this property was registered with your office, but apparently no permit was ever issued for it. Ms. Lutter told me that the County file on this property contains virtually no information on the size of the tank, what it was used for, when it was used and when use ceased, if ever. Ms. Krebs has no knowledge of the tank.

On Ms. Krebs' behalf I have telephoned several environmental consultants, asking them to solicit proposals for removing the

tank from the property and to cure any soil contamination caused by the tank. I have requested that proposals be submitted to me on or before January 15, 1992. I hope to receive proposals from the following environmental consultants:

1. Accutite Tank Testing and Maintenance
   35 South Linden
   South San Francisco, California 94080
   (415) 952-5551

2. C and B Construction Company

   San Mateo, California 94804
   (415) 572-8033

4. Precision Environmental (On-Site Technologies)
   1081 Alameda De Las Pulgas
   Suite 8
   Belmont, California 94002
   (415) 595-1863

5. Uribe and Associates
   2930 Lakeshore Avenue
   Suite 200
   Oakland, California 94610

6. Earth Metrics, Inc.
   7000 Marina Boulevard
   Brisbane, California 94005
   (415) 742-9900

7. Geomatrix
   100 Pine Street, Suite 1000
   San Francisco, California 94111
   (415) 957-9557

To date I have received one proposal.

At this time, I cannot calculate the precise timetable for removing the tank and curing any contamination caused by it. Ms. Krebs will review the submitted proposals from the environmental consultants listed above on January 15, 1992, or shortly

thereafter. Hopefully, Ms. Krebs will have selected the environmental consulting firm and can instruct them to commence with permit applications to remove the tanks by the week beginning January 20, 1992.

Several of the above-mentioned environmental consultants indicated that the permit application process should be completed within 1 - 3 weeks after Ms. Krebs selects the contractor to perform the job. The tank should be removed within 30 days of selecting the contractor. The need for -- and the extent of -- any remedial work will be determined after the tank is removed, several soil samples are taken in the immediate area, and the soil samples are tested.

I hope that this information is sufficient for you to forestall any action by the District Attorney's office in assessing fines against the owner of the property in question. Please let me know if you have any questions.

Sincerely,

John Walthier

cc: Ms. Florence Krebs

INFORMATION ABOUT THIS BILL

IN CASE OF ERRORS OR QUESTIONS—Please call your billing representative if you have any questions concerning the current charges or other information on this invoice (Numbers are located on the reverse side - or call (650) 363-4305)

CHANGE OF OWNERSHIP—It is the owner's responsibility to notify Environmental Health of a change of ownership. Please complete the "Change of Owner Notification" form above **if you are the new owner** or if you have sold the business.

CHANGE IN MAILING INFORMATION—If you would prefer that bills be mailed to another location, please indicate the new address by crossing out the old mailing address and writing in the new one, we will update your account.

EFFECTIVE DATES—All charges made during the middle of the month are effective on the 1st day of the following month.

PAYMENT METHODS—Payments may be made through the mail by personal check, money order, cashier's check or credit card. Cash is accepted for payments made in the office only.

PAYMENTS—Payment arrangements can be made only with advanced approval by your billing representative.

RETURNED CHECKS

Checks returned from the bank will be charged a **$25.00** "Returned Check" fee. Subsequent payments must be made by either Visa/MasterCard, cashier's check or cash.

PENALTIES

LATE PAYMENT PENALTY— Payments received after due date are charged a 25% penalty.

FINANCE CHARGES—Payments received 90 days or more after the billing dates are charged a 1.5 % monthly Finance Charge. This charge will be added to your balance and calculated monthly.

REFUNDS & OVERPAYMENTS

REFUNDS—County policy provides that credits of more than $15.00 require a written request which we will provide to you by mail or FAX. Refunds require verification by County inspection staff prior to processing the request so please allow 3-4 weeks to receive your refund.

ENVIRONMENTAL HEALTH PROGRAMS

APARTMENT INSPECTION PROGRAM—Routine inspections are performed once every **four (4) years**. Complaints are investigated as they are received. Fees are prorated annually and cover the wide range of inspection activities ensuring the maintenance of housing throughout the County to meet minimum health and safety code standards.

POOL PROGRAM—Inspections of public swimming pools and spas are performed annually.

FOOD/RETAIL FOODS PROGRAM—All restaurants and markets are inspected annually. Fees are based on the seating capacity for restaurants and square footage for retail markets. Food handler training is offered by EH Staff.

MOBILE FOOD VEHICLES—Permits for existing vehicles expire in February of each year and require an annual inspection at that time. Fees for new vehicles are prorated to February.

HAZARDOUS MATERIALS/WASTES/UNDERGROUND TANKS— Environmental Health administers all hazardous materials/wastes, storm water and underground tank programs throughout the County. Fees are based on the quantity of material/waste stored and the number of underground tanks operated. A surcharge is collected by the County on behalf of the State to fund local oversight activities.

SEPTIC/WELL FEES—Permit fees are charged for site investigation, percolation tests, repairs, septic and well installations. Permits are valid for 90 days.

HOUSEHOLD HAZARDOUS WASTE—Call (650) 363-4305 for recycling locations or information about used oil, batteries, or our weekly product give away program. To make an appointment to dispose of household chemicals call (650) 363-4718.

HOURLY RATE (Reinspection Fees)—Staff time is charged at an hourly rate as determined by the Board of Supervisors. Violations not corrected by a specified date may require additional inspections which will be charged an hourly rate.

Gentlemen:

Environmental Assessment Reports for
1) 1830 S. Delaware Street
2) 470 Concar Drive
San Mateo, California

On behalf of our client, San Mateo Investors, LLC, enclosed are the Phase I/II environmental assessment reports for the captioned sites in San Mateo. The future development plans for Site 1 contemplate construction of a three-story structure with one level below grade parking, and a two-story building with no appreciable change in the present grades for Site 2. Once you have had a chance to review the attached reports, we would like to meet with you to discuss our findings and the future construction plans for the two sites in question. In the interim, should you have any questions, please contact us at your convenience.

Thank you and we look forward to meeting with you in the near future.

Very truly yours,

For San Mateo Investors, LLC

Transmitted herewith is our environmental assessment report for the former Denny's site in San Mateo, California. This report has been prepared in accordance with accepted practices for environmental studies, and with BAGG's in-house quality assurance program. The facts presented herein are based upon information obtained from historical maps, public files, and upon information independently discovered by BAGG during a site reconnaissance, subsurface exploration, and analytical testing.

Thank you for the opportunity to provide environmental services on this project. Please do not hesitate to call, should you have any questions or comments.

Very truly yours,

REPORT

PHASE-I & II ENVIRONMENTAL ASSESSMENT
FORMER DENNY'S SITE
470 CONCAR DRIVE
SAN MATEO, CALIFORNIA
FOR SAN MATEO INVESTORS, LLC

1.0 EXECUTIVE SUMMARY

Reviews and reconnaissance conducted by BAGG has not revealed any record of historic or present hazardous material usage or storage, or under-ground or above-ground storage tanks on the site. A review of aerial photography has indicated that prior to the existing development of the site in the late 1970's, commercial or industrial operations, possibly associated with farming activity or other bulk operations involving a railroad spur, took place at the site in the 1940s and 1950's. Our reviews have further revealed that a number of structures existed at the site and in the immediate vicinity between the railroad and the current Telecenter site. However, the exact nature of the historic activities in the general site area and the use of the buildings are not known.

Shallow soil samples taken from the borings drilled on the southern limits of the parking area at the site have revealed low concentrations of heavy hydrocarbons, and trace levels of hydrocarbons as gasoline, benzene, toluene, xylenes in groundwater. MTBE was also detected in a groundwater sample taken one boring at a concentration of 13 ppb. The source and cause of the detected contamination of the soil and groundwater beneath the site is unknown. The heavy hydrocarbon residues may have resulted from the historic industrial/commercial activities involving the railroad to the west prior to the subdivision of the site to the current configuration and its subsequent development as Denny's Restaurant. However the light hydrocarbons (as gasoline), benzene, etc., and MTBE in particular, are believed to be from off-site sources. This investigation has identified a number of sites in the immediate area that have documented fuel leaks. Two of

these are the BP Station located on the southeast corner of 19th Avenue and Delaware Street, and the Arco Station situated on the southwest corner of the same intersection.

It is our opinion that the low to trace levels of contamination detected on this site are not high enough to warrant further investigation or cleanup. Nevertheless, we recommend that a copy of this report be submitted to the San Mateo County Department of Environmental Health so that they have the opportunity to review our finding and recommendations. Also, Boring P-4 encountered a fill layer between depths of 4 and 6 feet that contained a very strong but unidentifiable odor. If the future construction activity at the site exposes these materials thus creating nuisance to the construction workers and/or adjacent residents, it would be advisable to investigate the aerial extent of these soils by drilling several additional borings before the future development of the property. The samples taken from the borings must be screened with an appropriate portable meter capable of identifying and measuring the concentration of various gases.

2.0 INTRODUCTION

In this report, BAGG is pleased to present the results of a Phase-I and II environmental assessment of the captioned property in San Mateo, California. The Phase I environmental assessment portion of this study was conducted in accordance with the scope of services outlined in our Proposal No. 99-162 dated December 30, 1999. The scope of our services was later amended to include a Phase II environmental assessment of the site, as per our Proposal No. 00-088r, dated August 4, 2000. The attached Plate 1, Vicinity Map, shows the general location of the site, and Plate 2, Site Plan, provides a layout of the property, the principal site features, and the approximate locations of the borings drilled for the Phase II portion of this investigation. An untitled topographic drawing prepared by Aero-Geodic Corp., Job No. 007213, and dated March 3, 2000, provided the basis for the attached site plan.

It is our understanding that plans for the future development of the site contemplate the complete demolition of the existing restaurant building, and construction of a new 2-story office building near the northern property line, in the widest portion of the site. The site encompasses a total area of slightly less than one acre.

The results of our research of documented information regarding the site and the nearby vicinity, subsurface exploration, analytical testing of soil and groundwater samples, and our opinions relative to the presence of contamination at the subject property are discussed in the following sections of this report.

3.0 PURPOSE AND SCOPE OF SERVICES

The purpose of our services was to provide a preliminary assessment of the environmental conditions at the site prior to project financing and/or transactions involving the transfer of ownership of the property. Also included in the purpose of our study was a subsurface exploration program to investigate the environmental conditions within the soil and groundwater beneath the site.

To fulfill the above purpose, the specific scope of our services consisted of the following tasks:

- Review and research the most recently updated Federal and State agency databases regarding known or documented cases of contamination that may exist on-site or within a 1-mile radius of the property. The databases that were searched electronically were to be based on the latest ASTM guidelines.
- Based on the sites identified by the electronic search, review pertinent files or information from the San Mateo County Department of Environmental Health. Further, review the local building/planning department files for the subject property and local historical business directories.
- Review and research geologic literature pertaining to the site area to evaluate the geologic and hydrogeologic conditions beneath the property.
- Review and research aerial photography archives and historical maps and SANBORN fire insurance maps (if available) from public and private agencies such as our archives, or from USGS, etc., as judged appropriate, to acquire information relative to present and prior land use and drainage patterns at the site and immediate vicinity.
- If possible, conduct an interview of the current property owners and occupants, and the former owners of the site regarding the historic land use and the former use of hazardous substances on the property.
- At the option of the client, research the ownership history of the site (50-year or 75- or 100-years chain of title).

- Perform a detailed reconnaissance of the site and the building interior noting any physical evidence (sight/smell) that hazardous or toxic substances may have been stored, used, spilled, or dumped at the site or in the immediate vicinity.

- Obtain a permit for drilling soil borings and converting them to piezometers from the San Mateo County Department of Environmental Health.

- Drill, log, and sample 3 borings to depths of 15 to 17 feet with a truck-mounted rotary-wash drilling rig. Measure and record the groundwater levels. Obtain undisturbed samples of the subsurface soils at 5-foot-intervals, and grab samples of the groundwater for analytical testing. Decontaminate the augers prior to drilling each new boring, and the sampling equipment following every sampling episode. Convert two of the borings to piezometers in accordance with the standard protocol for the installation of monitoring wells. Store the drill cuttings in 55-gallon sealed and labeled drums to be left on-site.

- Screen the soil samples in the field with an Organic Vapor Meter (OVM) for the presence of hydrocarbons.

- Transport the soil and groundwater samples to a State-certified analytical testing laboratory and perform various analytical tests for the presence of Total Petroleum Hydrocarbons as gasoline, diesel, and motor oil with BTEX and MTBE. Two soil and one groundwater samples from each boring were to be analyzed for these contaminants.

- Prepare four copies of a report summarizing our findings, including a vicinity map, a site plan, results of database search and file review, discovered information on probable groundwater and soil quality beneath the site, and our conclusions regarding the environmental condition of the subject site.

The scope of our services did not include an assessment or identification of asbestos containing building elements, lead-based paint, or a radon survey.

4.0 SITE CHARACTERIZATION

4.1 Site Location and Description

The site is located on the south side of Concar Drive adjacent to the Highway 92 entrance/exit ramp in a light industrial/commercial area of the City of San Mateo. The subject property is an irregularly-shaped (nearly triangular) parcel that measures roughly 480 feet in length (east-west) and 190 feet in width at its widest portion adjacent to the freeway entrance/exit ramp. It is bounded by Concar Drive on the north, by Highway

92 entrance/exit ramp on the east, and by Highway 92 on the south. The most prominent site feature is an existing single-story masonry block restaurant building that was constructed in 1979. Areas south and west of the building consist of paved parking lots and driveways. The site surface is essentially flat and is generally at the same elevation as Concar Drive to the north. However, a north-facing slope covered with vegetation is situated just beyond the southern property boundary at Highway 92, some 20 to 30 feet higher in elevation than the subject site. The fill embankment is currently covered with thick vegetation and landscaping, and the topographic drawing of the site indicates the fill slope is at an approximate gradient of 2:1, horizontal to vertical. Areas immediately east of the site consist of a sloping entrance ramp from Concar Drive to the west-bound lanes of Highway 92.

Most of the site outside the building area is paved parking, except for a very small landscaped area between the north side of the building and Concar Drive, and the last hundred feet or so to the west near the point of the triangular property, which is vacant and covered with dry grass. The paved parking lot is relatively level with elevations that vary from a high of about 5.2 feet at the western end of the parking lot, to a low of about 1.4 feet at a catch basin opposite the southeast corner of the existing building. It appears the entire site drains toward this catch basin. The 7.5-Minute San Mateo Quadrangle map (1993) published by the United States Geological Survey (USGS) indicates the general ground surface elevation at the site is about 5 feet (National Geodetic Vertical Datum of 1929).

4.2 Regional Geology

The generalized geologic map included with "Maps Showing Faults and Earthquake Epicenters in San Mateo County, California," (Brabb and Olson, 1986) indicates the general site area is underlain by Holocene Estuarine Mud (Qm) or young bay deposits. This unit consist of unconsolidated water-saturated bay mud and artificial fill overlying the bay mud. The mud is generally between 0 to 40 meters in thickness and locally overlies alluvium and/or old bay mud. The bedrock underlying the alluvium and old bay mud consists of the Franciscan formation *(Borcherdt, Gibbs, and Lajoie, 1975)* which is expected to be present between depths of 100 to 200 feet below the ground surface in the general site vicinity.

4.3 Hydrogeology

Accurate information regarding the hydrogeology of the site vicinity is not available; however, our review of information from previous subsurface explorations performed in the general site area by others indicate the direction of groundwater flow in the immediate vicinity of the subject site is highly variable. Although it is reasonable to assume that the overall direction of the groundwater flow should be towards the east/northeast, or towards the San Francisco Bay, the reports prepared by other environmental consultants for the former Exxon and the active Shell stations as well as other sites in the area with documented contamination cases, have reported varying information regarding the direction of flow of the groundwater at specific sites in the vicinity, and at specific times.

It is expected that groundwater flow, in most cases, will generally follow the surface topography. The topographic map of the property indicates that with the exception of local irregularities and various drainage channels, the ground surface slopes down very gently towards the northeast, or the San Francisco Bay. Thus, it is anticipated that the predominant direction of the groundwater movement is also towards the northeast, or the Bay. However, the information reviewed for this and other studies in the vicinity indicates the direction of groundwater movement in the general area cannot be predicted with any degree of certainty. The reports prepared by RESNA and others for the former Exxon station located on the southeast corner of Concar Drive and South Delaware Street indicate a south/southwest groundwater movement direction, and those prepared by Cambria for the Shell Station located on the northwest corner of the same intersection indicate an east/southeasterly groundwater gradient. Furthermore, HK2, Inc./SEMCO have prepared a report for the former Vail Burner & Oil site located at 1741 Leslie Street several hundred feet east/northeast of the site that indicates a southeasterly flow direction for the groundwater. Another report prepared by RRM for the BP Oil Service Station situated on the southeast corner of Delaware Street and East 19th Avenue indicates an east-northeast direction of flow for the groundwater. A copy of a site plan from each one of these reports with the exception of the report by RESNA, all showing the groundwater elevation contours and movement direction, are attached in Appendix A of this report. The site plan is missing from our copy of the report by RESNA.

The previous reports form various consultants have also indicated groundwater levels as shallow as 2 to 3 feet below the existing ground surface. As an example, a boring drilled by Cambria in early April 1997 on a traffic island on Concar Drive approximately 370 feet east of the site, encountered groundwater at a depth of 2½ feet. As discussed later, the borings drilled at the subject site by BAGG in August 2000, encountered groundwater

at widely varying levels. However, the latest measurements taken from the two piezometers installed by BAGG at the site on October 4, 2000, measured the groundwater level at depths between 4 and 5 feet.

4.4 Site Reconnaissance

A reconnaissance of the site was made by one of our environmental assessors on October 12, 2000. We also interviewed the current property occupants about the historic use of the site and the existing building.

The former Denny's restaurant building is temporarily occupied by a flooring business that stores hardwood, penetrating wood floor finish, paint thinner in 2-gallon plastic containers, adhesive for flooring in 5-gallon buckets, etc. These materials are neatly stored on shelves or on the floor. Some of the interior walls of the building and a portion of the tile flooring have been removed by the flooring business, exposing the concrete floor slab. The building is a single level restaurant with masonry exterior and timber stud interior walls with a slab-on-grade concrete floor. Areas immediately adjacent to building contain a concrete apron. Asphalt paved parking and driveways exist to the east, south, and west of the building with landscaping islands and planters. A patch measuring about 6½ x 25 feet in plan dimensions and covered with concrete and asphalt exists immediately south of the building and the concrete apron, that appears to cover a below-grade structure. The patch contains three Christy boxes, two of which are labeled as sanitary sewer and water, and the third has not been labeled. The records reviewed from the City offices as discussed later in this report, have revealed a 1,000-gallon grease interceptor may be present at this location. The approximate location of this feature is shown on the attached site plan.

One of the current occupants of the building involved with the existing flooring business indicated that Granite Corporation operated an asphalt plant some 40 to 50 years ago to the north of the site, in the area currently occupied by K-Mart. He also stated that the subject site was used as an unpaved parking lot for the employees of the asphalt plant before Denny's Restaurant was constructed. Reportedly, the subject site and the nearby properties were owned by Leslie Salt at that time. Others have indicated that LC Smith owned and operated an aggregate company in this area in the 1950s.

4.5 Drainage

The dominant drainage feature near the site is Marina Lagoon, located about 3/4 mile northeast of the site, which ultimately drains to San Francisco Bay. Other drainage features or waterways have not been identified in the general site area.

4.6 Microfilm Review - City of San Mateo

We conducted a review of the microfilms pertinent to the site from the archives of the City of San Mateo on October 12, 2000. The microfilms generally contained the drawings for the building and the exterior landscaping improvements.

The original building plans were titled "Denny's Restaurant No. 1403, San Mateo, California," dated November 14, 1978, and prepared by DAS (abbreviation for Denny Architectural Services). The plans show the finished floor elevation of the building was established at an elevation of 3.26 feet. The notes on Sheet S-1 of the structural plans indicate the design of the building foundations was based on an allowable bearing value of 1,700 pounds per square foot (psf) based on a soils report by Judd Hull & Associates dated August 7, 1978. However, the footing and most other foundation details were not legible. Also, one of the drawings (Sheet No. not legible) show a 1,000 gallon grease interceptor and a 2-way clean out with trapper behind the restaurant building. Details for this feature was illegible as well.

The topographic drawing of the site when it was first improved, titled "Topographic and Boundary Survey" prepared by Michael J Majors, Civil Engineer, indicates a total area of 0.971 acre (42,278 square feet) for the subject property. The drawing also shows the site elevations range from about 5 feet on the west corner, to about 2.5 feet on the easternmost portions of the property, with the building area at elevations ranging from 2.2 to 3.3 feet.

4.7 File Review - City of San Mateo

We also reviewed the existing City records and files pertaining to the subject site on October 12, 2000. The records indicate the building permit was issued on February 26, 1979 to "Bank of California" in San Francisco (owner). A copy of the building permit is attached as Appendix B of this report. The permit indicates the

restaurant building is 5,963 square feet. The Negative Declaration For Denny's Restaurant, which is also included in Appendix B, indicates in addition to the franchise restaurant, 67 parking spaces would be built and about 7,100 square feet of landscaping area would be constructed as a part of the site development in 1978. This document also indicates the site was vacant prior to the construction of the restaurant. The preliminary Plot Plan and the floor plan of the Denny's Restaurant are also attached (Appendix B).

The file also contained a geotechnical observation/testing letter report titled "Report of Testing and Observation Services During Grading Operations - Building Pad Only," prepared by Judd Hull and Associates and dated March 15, 1979. The report indicates the grading activity on the building pad consisted of excavation of about 3 feet of on-site material which extended 6 feet beyond the building limits. Reportedly, unacceptable materials were removed and the excavated soil was placed in lifts compacted to 90% or greater degree of compaction until the pad was raised to the field grade stakes (rough pad grade?). An additional report by the same firm titled "Report of Testing and Observation Services During Grading Operations - Parking Area Only," dated October 18, 1979, indicates "an area to the rear of the building was excavated to remove some large concrete chunks and debris. The then exposed area was brought up to finish subgrade with the placement of aggregate base import material and compacted." These documents are also attached in Appendix B.

No other records were found under the address of the subject site prior to construction of the Denny's Restaurant.

4.8 Aerial Photography Review

The following aerial photos were reviewed. Four of the five aerial photos tabulated below were purchased from Vista Information Solutions, and the fifth one was reviewed from the archives of BAGG. Copies of these photos are attached as Appendix C of this report. The land use interpreted from the aerial photos is discussed below.

Table 1

Aerial Photography Review From USGS

Photo No.	Series	Date	Scale	Source	Land Use
-	-	10-11-43	1"=500'	ASCS (USDA)	4 or 5 structures shown are mostly illegible - farmland exist to the north and east containing the old sloughs. Railroad shown west of the site.
20-21	AV-170	6-3-55	1"≈800'	BAGG Archives	Industrial activity shown, site features consist of two large buildings; one with flat roof, and two smaller buildings with sloping roofs; the activity appears to be commercial or industrial (and/or bulk) operations, possibly associated with farming. A railrod spur is shown west of the site and north of the then 19th Ave.
-	-	6-9-56	1"=500'	ASCS (USDA)	Same as above
-	-	5-11-65	1"=500'	Cartwright Aerial Surveys	Site has been subdivided to the current condition and the nearly square bowling alley building with surrounding parking areas are shown to the east of the on/off freeway ramp. Concar Drive has been constructed and the site is vacant.
-	-	7-6-93	1"=833'	Napp 2nd Cycle	Same as above, except that the restaurant building and the surrounding parking and landscaping areas are shown.

4.9 Historic Map Review

At our request, a historic map search was made by Vista for a property nearby, and found four maps as summarized in Table 2. We were also able to locate one historic map (1939) from our archives. Copies of the historic topos found are included in Appendix D. The information obtained from the historic topos are tabulated below.

Table 2

Historical Maps

Date	Scale	Land Use
1939	1:62500	Site appears to be vacant and surrounded by a dike just to the east of the railroad.
1947	1:24,000	Southern Pacific railroad shown west of the site; 4 structures shown in a SE-NW direction in a row similar to the 1943 aerial photo- site elevation approximately 5 feet.
1949	1:24,000	same as above
1956	1:24,000	Same as above except that the site is vacant and structures are no longer present; the freeway entrance/exit ramp is shown.
1973	1:24,000	Same as above; site has been subdivided to the present configuration but still vacant; Bowling Alley building shown east of the site.

4.10 Search of USGS Flood Prone Maps

A search of the Federal Emergency Management Agency maps conducted for a previous study pertaining to a site in close proximity of the subject property determined that the subject site is not in special flood zone area.

4.11 Database Search by Vista & File Review (SMCEH)

At our request, a 1-mile radius search of databases containing information regarding properties with a reported leak(s) of contaminants into soil/groundwater, and sites that process, store, handle, or generate hazardous substances, was conducted by Vista Information Solutions, Inc. As a result of this search, pertinent business addresses were identified and compared with the results obtained from the same study performed on the property to the east (1830 S. Delaware Street). Because of close correlation of the results of the database search for both sites, we did not perform an independent review of the County files for this site. Instead, the information obtained from our file review for the adjacent site (i.e. 1830 S. Delaware Street) on January 14, 2000, as well as those contained in the database search report were used for this study, which entailed record review for 13 sites located within a quarter mile from the subject site. A file was not available from the County

Health Department for the US Postal site located at 1630 S. Delaware Street. Furthermore, the search did not identify the subject site as a property with a reported leak of hazardous substances or a RCRA permitted treatment, storage, and disposal facility. The results of the database search by Vista is included in Appendix E of this report.

Similar to our previous study for the site to the east, the database search revealed a total of 57 sites within a radius of 1 mile from the site with some form of fuel leak (LUST-Leaking Underground Storage Tanks database). Of the 57 LUST sites, 10 sites were located within 1/8-mile from the site, 7 sites between 1/8 to 1/4-mile, 16 sites within 1/4 to ½ mile, and 27 sites within ½ to 1 mile from the subject site under the same database. The search also identified one State water well located about 0.83 mile northwest of the site. The well depth has been listed as 180 feet and water use from this well has been identified for irrigation (USGS Water Wells database, SRC#1719, agency release date: March, 1998). Note that this information has not been independently verified by BAGG from the offices of the Environmental Health Department of the San Mateo County.

The following table provides a list of the files reviewed and describes the important facts about each site.

Table 3

Results of File Review From San Mateo County Department of Environmental Health

Site No.	*Site I.D. & Address*	*Location With Respect to Site*	*Important Facts*
1	BP/Tosco, 404 E. 19th Ave., San Mateo	0.11 mile- SE	This site is located at the southeast corner of East 19th and Delaware Street. BP purchased the facility from Mobil Oil in 1989 and subsequently transferred it to Tosco in 1994. Tosco continued to operate it under the BP brand before it was converted to a "76" brand facility. Currently 5 USTs are at the site, two 10,000 gal, one 2,000 gal gasoline, one 550 gal diesel, and one 500 gal used oil; all double wall fiberglass tanks installed in 1986. Currently 9 MWs exist at the site and one MW is off-site. Product piping along with 500 cy of soil associated with piping was removed in 1991. Groundwater was determined to be affected. Since 1991 to-date, 14 monitoring events have taken place. Groundwater has been found to fluctuate between 3½ to 6 feet bgs, with the movement generally determined to be in a northwest direction (Cambria, 1999). In 1996, only MW-4 contained 220 ppb TPHg and 2.6 ppb Benzene. The file contained a case closure report by Alisto Engineering Group dated 2-5-97 and the groundwater was reported to be flowing towards north-northwest. The file also contains a workplan for subsurface investigation dated 1-19-99, and an addendum to the same workplan dated 8-16-99.

Site No.	Site I.D. & Address	Location With Respect to Site	Important Facts
2	San Mateo Corp. Yard, 1949 Pacific Blvd., San Mateo	0.05 mile-SW	The information from this file indicates 3 USTs were removed in 1986, consisting of one 1,000 gal gasoline, one 1,000 gal diesel, and one 500 gal waste oil tanks. The 1,000 gal tanks were found to be leaking. Between December 89 and January 90, six borings were drilled to 15 feet bgs, and 3 were converted to monitoring wells. The soil samples did not contain any contaminants above the detection levels and the groundwater samples detected up to 60 ppb of TPHd. Groundwater was found to be about 4 feet bgs and flowing on a southeasterly direction. On 9-6-91, groundwater samples did not detect any contaminants. Documentation of events in the file are not in order or concise. Current USTs are active, and case closure has been denied by the County. Quarterly groundwater monitoring report by RPM dated 2-1-99 indicates the groundwater flow direction is towards south/southeast, and that MWs 2 and 3 contained MTBE concentrations at respective levels of 12 and 98 ppb. TPHg and BTEX were not detected however.
3	Delaware Shell, 1790 S. Delaware St., San Mateo	0.05 mile-NE	Leakage of used motor oil was reported in 1987 from a 550 gal tank which was removed and replaced, and the monitoring began subsequently. A report by Cambria dated June 9, 1997 states five monitoring wells were installed by Gettler-Ryan in 1985, and one monitoring well was installed by Hunter Environmental Services in 1986. Based on a subsurface investigation report by Cambria dated June 9, 1997, historically, well S-4 located adjacent to the underground storage tanks, has contained the highest hydrocarbon concentrations detected. This well is situated near the southeast corner of the site (site is on the NW corner of Concar Drive and Delaware Street). A 1996 report by Cambria reported 7,900 ppb of MTBE and 150 ppb of Benzene. However, the 1997 report by Cambria which addressed the installation and sampling of the S-7 monitoring well on the traffic island at the intersection of Concar Drive and Delaware, did not report any benzene or MTBE constituents over the detection levels. The groundwater flow direction was determined to be towards southeast in the 1997 report by Cambria. The 3rd quarterly monitoring report for 1999 by Cambria dated 9-30-99 also reported an MTBE level of 12,900 ppb and 206 ppb benzene in the well S-4. Well S-7 did not contain MTBE and benzene levels over the detection levels. Cambria's most recent report (9-30-99) also indicates corrective action plan was implemented by beginning weekly vacuum extraction on wells S-3 and S-4. Groundwater flow direction was determined to be towards the southeast in 1999.

Site No.	*Site I.D. & Address*	*Location With Respect to Site*	*Important Facts*
4	Former Exxon Station, 1801 S. Delaware St., San Mateo	0.07 mile-NE	In July 86, a hydrocarbon sheen and petroleum odor was noted on shallow groundwater (2 to 3 feet bgs) during modification of the gas delivery line & pump islands. An existing monitoring well (MW-1) was then sampled yielding TPHg levels of between 81 to 98 mg/l (ppm), and 13 to 24 ppm benzene (May & Aug. 1989). The 1986 report by HLA attributed the presence of hydrocarbons to the historic leak of the product lines that were removed in 1982. Three tanks, all fiberglass with no secondary confinement, were installed in 1982. In December 1989, HLA installed 3 monitoring wells - quarterly monitoring was performed by HLA in 1990- the March 1990 report indicates 4 monitoring wells were sampled and groundwater flow direction was determined to be south/southeast or parallel to Delaware Street. Groundwater extraction and treatment began in 1994 (Workplan by RESNA - 1993). Quarterly monitoring was performed by ERI in 1997 and the groundwater flow direction was determined to be towards northeast and northwest. Elevated MTBE and TPHg levels were found on the wells located generally on the east side of the property. Quarterly monitoring was done by ERI; June 30, 1998 report indicates groundwater flow direction was determined to be east/northeast, and that the remedial activities performed to date had removed about 5.62 lbs (less than 1 gallon) of product. The latest correspondence in the file is dated July 6, 1998 and consists of a letter by the County requiring testing of soil samples to be taken from beneath the fuel tanks and testing for MTBE; the letter also pointed outs that elevated MTBE levels were observed in the treatment effluent and that the report submitted contained no discussion on this matter. The letter by the County also stated that the two wells installed in the interceptor trench were to be reconfigured for improved recovery efficiency and that work had to be completed by April 1998.
5	Kmart, 1700 S. Delaware St., San Mateo	0.05 mile-North	A subsurface investigation report by GRA Associates dated July 30, 1999 indicates a 1,000 gal waste oil tank associated with a former auto center was removed in Nov. 1988. Laboratory analysis of 10 soil samples revealed TPHd ranging from non-detect to 150 ppm. Oil and grease was also found to be non-detect for nine samples and positive for one sample at a concentration of 1,300 ppm. Groundwater was found to be at depths ranging from 6 to 10 feet. TPHg in groundwater was detected from less than detection levels to 0.095 ppm. No MTBE or benzene was detected in the samples. In the letter dated 11-17-99, San Mateo County approved the workplan by GRA for installation of 2 monitoring wells and groundwater sampling. No data in the file whether this was accomplished.
6	Arco Smog Pro, 4495 1950 S. Delaware St., San Mateo	0.11 mile-SE	This site is situated at the southwest corner of 19th and Delaware Street. A risk-based corrective action human health risk assessment by Secor dated 11-25-96 indicates groundwater contamination from gasoline and motor oil was detected in 1992 through monitoring from unknown causes. Quarterly groundwater monitoring report by Secor dated June 15, 1999 indicates TPHg was not detected in any of the five wells sampled and tested. Benzene was detected in 2 wells at 2.1 and 0.5 ppb, and MTBE in all 5 wells was found to be in concentrations as much as 3,000 ppb. Groundwater flow direction was determined to be towards the southwest.
7	G & C Auto, 1753 Leslie St., San Mateo	0.12 mile-West	A 300 gal gasoline tank was removed in 1993 along with the contaminated soils in the excavation, and a MW was installed in March 1993 by SCI. TPHg or BTEX were not detected in the groundwater sample from the MW, and SCI requested site closure (note: the SCI report states a 500 gal tank was removed, 50 cy of soil was over-excavated, and that groundwater was present in the excavation at a depth of 7 feet.) The County then issued closure of the case in their letter dated 12-16-94.

Site No.	Site I.D. & Address	Location With Respect to Site	Important Facts
8	Vail Burner & Oil Company, 1741 Leslie St., San Mateo	0.12 mile-West	This site was reportedly a bulk oil distribution facility from about 1940 to 1989. In 1992, SEMCO removed one 420-gal gasoline UST from the site. The soil samples contained TPHg at 160 ppm, TPHd at 200 ppm, and benzene at 1.8 ppm. The soil stockpile sample contained 3,600 ppm TPHg, 1,900 ppm TPHd, 97 ppm oil & grease, and 11 ppm benzene. Groundwater from the tank cavity contained 66 ppm TPHg, 0.09 ppm TPHd, 9.4 ppm benzene, and 0.017 ppm 1,2-dichloroethane and concentrations of dissolved chromium, nickel, and zinc that exceeded CRWQCB municipal water Qaulity objectives. In 1998, HKE/SEMCO removed two heating oil USTs with capacities of 285 and 350 gal. Soil samples revealed 2,000 ppm TPHd and 1 ppm benzene. Groundwater sample collected from the excavation contained 1,600 TPHd and 0.017 ppm benzene with a visible sheen. The excavations were backfilled with the excavated soil. In 1998, HK2 drilled 6 borings and converted four borings to MWs. The groundwater samples collected from the MWs contained 0.3 ppm TPHg, 0.09 ppm TPHd, less than 1 ppb of BTEX and MTBE. These are summarized in a 1999 workplan for site characterization and remedial excavation (4-9-99). Groundwater gradient was reported to be towards the east. HK2 then purchased the property and agreed to implement the workplan. Analytical results by Environmental Assessment and Mountjoy Services report dated 9-17-99 indicated 1,800 ppm TPHg and 8.4 ppm benzene in soil, and 1.2 ppm TPHg and 0.06 ppm benzene in the groundwater.
9	Bob Randick, Company 1740 Leslie St. San Mateo	0.13 mile-West	The information from this file indicates between 1950 and 1953, UPS occupied the site and in 1992, SEMCO removed one 7,500 gal and one 2,000 gal gasoline tanks and one 2,000 gal waste oil tank from the site. One tank was found to be in a bad condition. Contaminated soils remaining in the excavations were removed and replaced with clean soils in April 1999. Some contaminated soil still remains at the site. Low levels of TPHd at 0.33 ppm and MTBE at 0.012 ppm were detected in the groundwater. TPHg or benzene were not detected. Closure memorandum was then issued by the County in their letter dated 5-6-99. According to the County Health, the remaining contaminated soil is estimated to be about 10 cy, the site presents no significant risk to the environment and passive bio-remediation is expected over-time and TPHd is anticipated to naturally attenuate.
10	Pacific Insulation, 149 South Blvd., San Mateo	0.19 mile-West	In 1991, a UST was removed that had reportedly failed a tightness test. No holes were observed during removal. Samples taken at 9 feet bgs from the bottom of excavation had distinct gasoline odors, and contained 6,300 ppm of TPHg. 30 cy of contaminated soil was then removed and disposed off-site. A monitoring well was installed by Environmental Restoration Services in 1994 and the groundwater samples detected 14 ppm TPHg in 1994 and 21 ppm TPHg in 1996 with a benzene content of 12 ppm also in 1996. Notes from the County file suggests that groundwater impact remains severe. Letter by the County dated 3-9-99 documents non-compliance at this site requiring a workplan for definition of the extent of contamination. Since the property owner is deceased, his estate is responsible for remediation and site cleanup.

Site No.	Site I.D. & Address	Location With Respect to Site	Important Facts
11	San Mateo Police Dept., 2000 S. Delaware St., San Mateo	0.15 mile-SE	In May 1992, SEMCO removed a 1,000 gal gasoline tank, a 1,500 gal diesel tank as well as the piping associated with the tanks. The groundwater within the excavation contained floating product. No remediation activity was performed as the analytical test results suggested contamination was limited to the tank backfill area. A MW was installed by Artesian Enviro. Consultants in 1993. A letter by San Mateo County dated 7-7-98 states that the site may qualify as a low risk site per RWQCB Interim Guidance and would be reviewed for closure. A site assessment was then conducted by Subsurface Consultants dated 9-10-99 and concluded that future construction activity in the area, if any, may require special handling of soil and groundwater, should any excavations be planned. A letter by the County dated 10-27-99 regarding the review of the report by Subsurface Consultants states groundwater monitoring is required to determine if the plume is stable as the hydrocarbon concentrations detected were as much as 1.3 ppm TPHg, 0.98 ppm TPHd, 3 ppm TPH as motor oil, and 0.34 ppm MTBE in the groundwater.
12	US Postal Service AUX Garage, 1630 S. Delaware St., San Mateo	0.19 mile-North	A file for this site was not available from the San Mateo County Department of Environmental Health. However, the database search report by Vista indicates that a leak was reported in 1990 at this site from a UST containing miscellaneous motor vehicle fuels. The leak was then stopped by tank closure. The Vista report also indicates groundwater was affected as result of the leak. The remediation status has been reported as "pollution characterization." No other information is available about the levels of contamination or the nature of plume characterization at this time.
13	LC Smith Trust, 1620 Delaware St., San Mateo	0.22 mile-NW	Groundwater and soil contamination was reported in 1984 prior to removal of the USTs from the site, when approximately 18 inches of floating product was measured in one of the wells installed by Dames and Moore. In 1986, a remedial action plan prepared by Dames & Moore was implemented by AEMC, including the removal of all USTs and skimming of free product from the surface of the water in the excavation. Two groundwater collection trenches were completed, and 6 standpipes suitable for groundwater extraction were installed in the center of the excavation. In 1993, a groundwater treatment system designed by Dames & Moore was constructed by BAI, consisting of extraction of groundwater and treatment by activated carbon. Between 1993 and 1996, the system failed and/or was redesigned to meet the regulatory requirement with unfavorable results. In 1996, San Mateo County concluded that additional investigation would be necessary to define the extent of groundwater contamination. Various other investigative events took place to define the plume and monitor contamination between 1996 through 1999. A groundwater monitoring report dated July 29, 1999, by BAI indicates a northerly gradient for the groundwater. TPHg and BTEX were not detected in wells B-1 and B-7, but detected in the others at concentrations ranging from 520 to 8,900 ppb. MTBE was also detected in wells B-3 through B-6, SPC, and SPFC, at levels ranging from 14 to 190 ppb. BAI also submitted a workplan for a treatment system which was approved by the County in their letter of 11-19-98. Soil and groundwater investigation and quarterly groundwater monitoring appears to be in progress.

Site No.	Site I.D. & Address	Location With Respect to Site	Important Facts
14	Stoller & Sons, 1150 S. 19th Ave., San Mateo	0.27 mile-East	In 1990, two 5,000 gal USTs and associated piping were removed. A MW was then installed in 1991 under the oversight of the County. Analytical testing for TPHg and BTEX did not detect these substance above the reporting limits (1994). In a letter dated 9-8-99, County Health Services Agency states this site may qualify as a "low risk" groundwater case, and requires one additional sampling and testing episode be conducted in October 1999.

5.0 PHASE II ACTIVITY

5.1 General

Because of the highly variable nature of the groundwater flow direction in the site vicinity, and documented leaks of contaminants nearby, a subsurface exploration program was designed to investigate the possibility of migration of contaminants to the subject site from polluted sites in the area as well as the on-site sources. For this purpose, three borings were drilled to explore the environmental nature of soil and groundwater beneath the site. Two of the three environmental borings were converted to piezometers for the purpose of groundwater level measurements in the future. Note that the piezometer locations and elevations have not been surveyed.

5.2 Field Exploration and Methodology

Environmental conditions beneath the site were explored by drilling three borings to a depth of 16½ feet. The approximate locations of the exploratory borings drilled for this investigation and designated as P-4 through P-6 are shown on the attached Plate 2, Site Plan. Borings 1 through 3 were drilled for geotechnical exploration and were not tested for contaminants. The logs of those borings, therefore, are not presented in this report. The environmental borings were advanced with a truck-mounted drilling rig utilizing continuous flight augers with the exception of Boring P-5, which was advanced with rotary-wash drilling equipment due to the presence of shallow groundwater in the boring and the presence of caving gravelly fill soils. Borings P-5 and P-6 were instrumented with a piezometer. One of our engineers technically directed the exploration, maintained a continuous log of the borings, and obtained disturbed bulk samples and undisturbed brass tube samples for analytical testing and visual examination.

The graphical representation of the materials encountered in the borings are attached, as follows:

- Plate 3, Unified Soil Classification System, illustrates the general features of the soil classification system used on the boring logs.
- Plate 4, Soil Terminology, lists and describes other soil engineering terms used on the boring logs.
- Plate 5, Boring Log Notes, describes general and specific conditions that apply to the boring logs.
- Plates 6, Key to Symbols, describes various symbols used on the boring and monitoring well (pierzometer) logs.
- Plates 7 through 9, Boring and Monitor Well Logs, describe the soils encountered, show the depths and blow counts for the samples, and show the details for the piezometers as installed.

One of our geotechnical engineers described the soil encountered in the borings in accordance with the Unified Soil Classification System. Soil samples were collected at 5-foot-intervals from a depth of about 1 foot to 15 feet below the surface of the pavement. In addition, a grab sample of the groundwater from each boring was obtained for laboratory analysis, using a new disposable bailer in each boring. Soil cuttings and rotary-wash fluid from the borings were stored in 55-gallon steel drums that were left on-site.

Exploration and sampling of the soil and groundwater for this investigation was conducted in accordance with the generally accepted protocol. Drilling equipment was steam cleaned prior to the advancement of each boring. Likewise, the soil sampling equipment was decontaminated prior to each sampling episode. A new disposable bailer was used to sample the groundwater in each boring.

Boring locations and elevations were not surveyed. The approximate elevation of each boring was estimated from the spot elevations shown on the topographic drawing of the site as referenced earlier in this report.

Gasoline odor or discoloration was not noted in any of the soil samples. A portable organic vapor meter (OVM) was used to screen the soil samples with no resulting readings. However, unidentifiable strong odor was noted in Boring P-4 as discussed later. The soil and water samples were then placed in a cooler with ice until delivered to the analytical laboratory.

5.3 Subsurface Conditions

Existing pavement was encountered at the surface of the borings and consisted of 1½ to 2 inches of asphaltic concrete underlain by 4 to 2 inches of aggregate base.

The borings encountered fill soils ranging from about 3 to 5½ feet in thickness. The fill appeared to be heterogeneous in nature. In Boring P-4 the fill consisted of 3½ feet of very stiff sandy lean clay with gravel CL underlain by 2 feet of black fat clay (CH) with black oozing lenses and containing salt crystals resembling crushed glass. This material was very odorous, although our OVM did not record any reading. A grab sample of this material was collected for analytical testing. In P-5, the fill consisted of about 3 feet of loose and wet silty gravel (GM). In P-6, the fill consisted of about 4 feet of medium dense clayey gravel (GC).

Native materials in the borings consisted of alluvial soils in Boring P-4 and young bay deposits in Borings P-5 and P-6. The native soils in Boring P-4 consisted of stiff lean clay with organics (CL) and dense clayey sand (SC). Borings P-5 and P-6 encountered native young bay deposits. These materials consisted of about 2 to 2½ feet of soft and wet organic clay and peat (OH, PT, bay mud). The alluvial soils underlain the bay mud in Borings P-5 and P-6 consisted of stiff to very stiff layers of sandy lean clay with gravel (CL), and dense to very dense silty and clayey fine sand with gravel (SM & SC) to the depth explored. The upper portion of the alluvium in Boring P-5 contained strong odor with no measurements recorded on our OVM.

5.4 Groundwater

Groundwater was measured in the borings during drilling and also two months later as tabulated below. Groundwater levels are anticipated to fluctuate due to the amount of the rainfall from season to season, and possibly due to tidal effects.

Table 4

Groundwater Levels Measured in the Borings

Boring No.	Depth to Groundwater First Encountered, Feet 8/4 & 7/2000	Depth to Groundwater at the Termination of Drilling, feet 8/4 & 7/2000	Depth to Groundwater on 10/4/2000
P-4	11.0	13.5	-
P-5	2.0	1.0	5.0
P-6	12.5	4.3	4.1

5.5 Laboratory Analysis and Results

The soil and groundwater samples were transported to Entech Analytical Labs under chain of custody for analysis for Total Petroleum Hydrocarbons as gasoline with BTEX and MTBE, as diesel, and as motor oil. The chain of custody record and the analytical reports from the laboratory are included as Appendix F, with the results summarized in the following tables.

As shown in Table 5, only 2 samples taken from depths of 5 and 3 feet from Borings P-4 and P-6, respectively, detected 450 and 290 ppm hydrocarbons as motor oil. The sample collected from 5 feet in Boring P-4 was a grab sample taken from the drill cuttings because of its very strong odor. Other soil samples collected from the borings at depths ranging from 3 to 11 feet did not detect any hydrocarbons as gasoline or diesel or other fuel constituents such as BTEX and MTBE.

As shown in Table 6, the groundwater samples collected from Boring P-4 and P-5, detected 480 and 910 ppb heavy hydrocarbons, respectively, and motor oil at respective levels of 490 and 1,100 ppb. The analytical laboratory has reported that although these results were within the quantitation range, their chromatographic patterns were not typical of fuel. However, the groundwater from all three borings contained between 100 to 250 ppb total petroleum hydrocarbons as gasoline and trace levels of benzene, with traces of toluene and xylenes in Boring P-5 only. The groundwater sample taken from Boring P-4 also detected 13 ppb of MTBE.

Table 5

Results of Analytical Tests on SOIL Samples

Boring No.	Sample Depth (feet)	Date Sampled	Total Petroleum Hydrocarbons as Gasoline (TPH-g) with Benzene, Toluene, Ethyl-Benzene, Xylenes, & MTBE (mg/kg)						Total Petroleum Hydrocarbons as Diesel (TPH-d) & Motor Oil (mg/kg)	
			TPH-g	Benzene	Toluene	Ethyl-Benzene	Xylenes	MTBE	TPH-d	Motor Oil
P-4	6	8/4	N.D.	N.D.	N.D.	N.D.	N.D.	N.D.	N.D.	N.D.

TPH-g	Total petroleum hydrocarbons as gasoline
TPH-d	Total petroleum hydrocarbons as diesel
MTBE	Methyl-t-butyl Ether
*	Grab soil sample
**	Results within quantitation range; chromatographic pattern not typical of fuel

6.0 CONCLUSIONS

Reviews and reconnaissance conducted by BAGG for this environmental assessment have not revealed any record of historic or present hazardous material usage or storage, or underground or above-ground storage tanks on the site. The aerial photography reviewed has revealed industrial/commercial activity as far back as 1943. However, the exact nature of these activities is not known other than what has been stated by those who are familiar with the general site area. The industrial/commercial activities in the site area appear to have been bulk operations, possibly associated with the railroad west of the site used for the transportation of construction materials such as sand, etc. A railroad spur also existed on the eastern portion of the site in the 1950s.

The subject property is situated on the edge of historic San Francisco Bay, and the existing building at the site has been constructed upon reclaimed lands. This typically involved construction of levees to separate the area from bay waters and placement of fill over the bay mud. As revealed by the historic aerial photographs, the site was most likely filled prior to 1955.

Testing of soil and groundwater samples collected from the borings drilled at this site has revealed low levels of heavy hydrocarbons such as motor oil in soil. Specifically, these hydrocarbons were detected in samples of fill soils collected at depths of 5 and 3 feet from borings P-4 and P-5. The groundwater samples taken from the same two borings (P-4 & P-5) also contained trace levels of the total petroleum hydrocarbons as gasoline with trace levels of benzene, toluene, and xylenes, and heavy hydrocarbons with their chromatographic patterns not typical of fuel. The a-typical chromatograph may be due to partial decomposition of the old contamination. Note that the site may have been used as a soil-covered parking lot some 40 to 50 years ago. Furthermore, the groundwater sample taken from Boring P-4 also detected 13 ppb of MTBE.

The source of heavy hydrocarbons within soil and groundwater is unknown. Possibilities include the historic industrial/commercial operations that involved the railroad on this and the nearby sites. It is unlikely that such contaminations were caused by off-site sources. The light hydrocarbon residues in groundwater on the other hand, are believed to have migrated to the site from off-site sources to the south. This is particularly true with respect to MTBE that was detected at trace levels in the groundwater sample taken from Boring P-4. The BP Station situated on the southeast corner of 19th Avenue at Delaware Street, and the Arco Station located on the southwest corner of the same intersection to the south/southeast, both have documented cases of soil and

groundwater contamination with petroleum hydrocarbons. Other contamination cases also exist throughout the general site area. However, because the groundwater is not and will not be pumped to the surface, it is our opinion that the hydrocarbon levels in the groundwater are not significant enough to warrant further investigation or delineation.

MTBE is an additive that has recently been used to enhance gasoline performance and it was not in general use prior to the development of the site in 1957. The US/EPA proposed 70 ppb for MTBE in drinking water as a "Lifetime Health Advisory" concentration that is considered protective of noncarcinogenic adverse health effects over a lifetime of exposure (US/EPA, 1997). Cal/EPA identified an interim "Action Level" of 35 ppb in drinking water in 1991. Neither concentration is a regulatory standard. However, odor and taste thresholds for MTBE in water, which may affect consumer acceptability, have been reported to range from 15 to 130 ppb. The measured concentration of 13 ppb in Boring P-4 is lower than the above-noted threshold levels.

During subsurface exploration, the soil beneath this site had a distinct odor that was strong at times. The odor was particularly strong in Boring 4 at depths between 4 to 6 feet to a point that caused discomfort to the drilling crew. The exact nature of the odors remains unknown. Our geotechnical engineer that had the responsibility of sampling and logging the borings, has indicated that an abnormal odor emanated from all borings, at times resembling manure and at other times resembling tar paper or roofing material. However, our OVM did not record any measurements in the borings or when the soil samples were screened.

7.0 RECOMMENDATIONS

Moderate to low levels of heavy hydrocarbons were found in shallow soil samples from the two borings drilled on the southern portion of the site, and trace levels of the same hydrocarbons were also detected in the groundwater samples taken from the same borings. MTBE at very low concentration was detected in the groundwater sample collected from one of the environmental borings. On this basis and to comply with the applicable disclosure laws, we recommend that a copy of this report be submitted to the San Mateo County Health Services Agency (Attention: Paresh C. Khatri, Hazardous Materials Specialist).

The soils underlying portions of the site have been found to contain low concentrations of heavy hydrocarbons. As these materials are confined by parking lots and floor slabs, we do not recommend further delineation or study of their condition and extent. This conclusion assumes that the future development of the site will not involve excavations or below-grade structures in this portion of the site, and the same area will remain covered by pavement or hard scape. The detected heavy hydrocarbons in shallow soil and groundwater are considered insignificant and are expected to bio-degrade and attenuate over-time.

However, the strange odor emanating from Boring P-4 at depths between 4 to 6 feet is significant in that any future excavations in this area may expose the construction workers to respiratory problems. If the development will include excavations in the general vicinity of Boring P-4, it would be advisable to perform an additional exploration in the area to further define the nature and extent of the odor. A more appropriate portable meter that is able to measure the concentrations of various gases and identify the gas type, would be necessary to take field measurements. Such explorations may be performed by drilling several 7- to 10-foot-deep borings in the area of Boring P-4 (or proposed excavations) and by continuous sampling of the subsurface materials between the surface and depths of 6 to 7 feet. Analytical testing of the soil and groundwater samples from each boring would also be necessary for a variety of contaminants. Again such odors would not pose a problem unless excavations take place in the general area of Boring P-4.

8.0 CLOSURE

This report update has been prepared in accordance with generally-accepted engineering practices strictly for the use of San Mateo Investors, LLC, and is intended to be a preliminary Phase I and Phase II assessment of contamination of soil and groundwater from toxic substances at the site, the limits of which are shown on the attached Plate 2, Site Plan.

Chemical/analytical testing of the soils and groundwater has only been performed for a limited group of hazardous materials that were selected based on reports of nearby off-site activities, and not for a wide range of contaminants. Identification and testing of the building elements containing asbestos or lead-based paint was not performed by this study. It is possible that conditions may be present within the site or in the immediate vicinity which significantly differ from those indicated by research and review of information available from

public agencies, by our reconnaissance of the site and its immediate vicinity, and the analytical testing performed. This report has been based on information obtained from usually reliable sources, as discussed herein. BAGG cannot and does not guarantee the authenticity or reliability of the information it has relied upon.

Judgements leading to conclusions are generally made with less-than-perfect knowledge of the conditions present; however, our site reconnaissance and evaluation have been performed as a part of a study considered appropriate and prudent for this type of assessment. This report, however, should not be construed to offer any conclusions or opinions regarding potential liability and/or profitability associated with site ownership or development.

The following Plates and appendices are attached and conclude this report:

COARSE-GRAINED SOILS
LESS THAN 50% FINES*

GROUP SYMBOLS	ILLUSTRATIVE GROUP NAMES	MAJOR DIVISIONS
GW	Well graded gravel Well graded gravel with sand	GRAVELS More than half of coarse fraction is larger than No. 4 sieve size
GP	Poorly graded gravel Poorly graded gravel with sand	
GM	Silty gravel Silty gravel with sand	
GC	Clayey gravel Clayey gravel with sand	
SW	Well graded sand Well graded sand with gravel	SANDS More than half of coarse fraction is smaller than No. 4 sieve size
SP	Poorly graded sand Poorly graded sand with gravel	
SM	Silty sand Silty sand with gravel	
SC	Clayey sand Clayey sand with gravel	

NOTE: Coarse-grained soils receive dual symbols if:
(1) their fines are CL-ML (e.g. SC-SM or GC-GM) or
(2) they contain 5-12% fines (e.g. SW-SM, GP-GC, etc.)

FINE-GRAINED SOILS
MORE THAN 50% FINES*

GROUP SYMBOLS	ILLUSTRATIVE GROUP NAMES	MAJOR DIVISIONS
CL	Lean clay Sandy lean clay with gravel	SILTS AND CLAYS liquid limit less than 50
ML	Silt Sandy silt with gravel	
OL	Organic clay Sandy organic clay with gravel	
CH	Fat clay Sandy fat clay with gravel	SILTS AND CLAYS liquid limit more than 50
MH	Elastic silt Sandy elastic silt with gravel	
OH	Organic clay Sandy organic clay with gravel	
PT	Peat Highly organic silt	HIGHLY ORGANIC SOIL

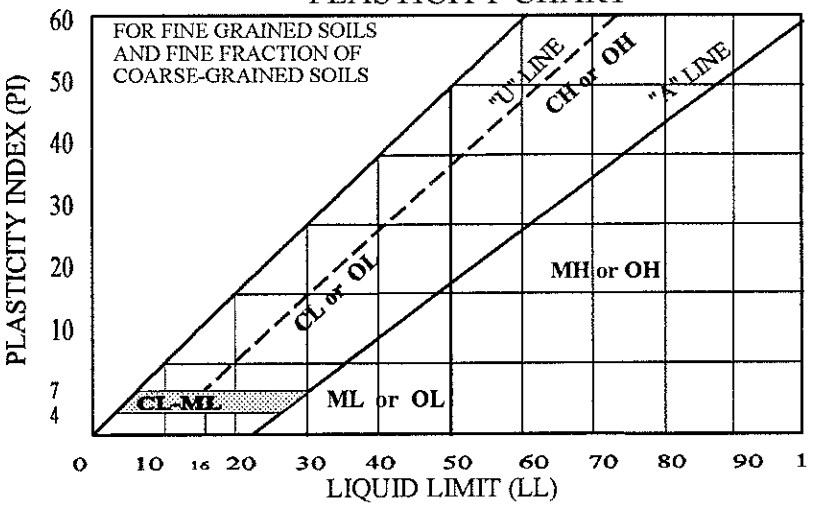
NOTE: Fine-grained soils receive dual symbols if their limits plot in the hatched zone on the Plasticity Chart (CL-ML).

SOIL SIZES

COMPONENT	SIZE RANGE
BOULDERS	ABOVE 12 in.
COBBLES	3 in. to 12 in.
GRAVEL	No. 4 to 3 in.
Coarse	¾ in to 3 in.
Fine	No. 4 to ¾ in.
SAND	No. 200 to No.4
Coarse	No. 10 to No. 4
Medium	No. 40 to No. 10
Fine	No. 200 to No. 40
*FINES:	BELOW No. 200

NOTE: Classification is based on the portion of a sample that passes the 3-inch sieve.

PLASTICITY CHART



Reference: ASTM D 2487-93, Standard Classification of Soils for Engineering Purposes (Unified Soil Classification System).

GENERAL NOTES: The tables list 30 out of a possible 110 Group Names, all of which are assigned to unique proportions of constituent soils. Flow charts in ASTM D 2487 aid assignment of the Group Names. Some general rules for fine grained soils are: less than 15% sand or gravel is not mentioned; 15% to 25% sand or gravel is termed "with sand" or "with gravel;" and 30% to 49% sand or gravel is termed "sandy" or "gravelly." Some general rules for coarse-grained soils are: uniformly-graded or gap-graded soils are "Poorly" graded (SP or GP); 15% or more sand or gravel is termed "with sand" or "with gravel;" 15% to 25% clay and silt is termed clayey and silty and any cobbles or boulders are termed "with cobbles" or "with boulders."

UNIFIED SOIL CLASSIFICATION SYSTEM

SOIL TYPES (Ref 1)

Boulders: particles of rock that will not pass a 12-inch screen.
Cobbles: particles of rock that will pass a 12-inch screen, but not a 3-inch sieve.
Gravel: particles of rock that will pass a 3-inch sieve, but not a #4 sieve.
Sand: particles of rock that will pass a #4 sieve, but not a #200 sieve.
Silt: soil that will pass a #200 sieve, that is non-plastic or very slightly plastic, and that exhibits little or no strength when dry.
Clay: soil that will pass a #200 sieve, that can be made to exhibit plasticity (putty-like properties) within a range of water contents, and that exhibits considerable strength when dry.

MOISTURE AND DENSITY

Moisture Condition: an observational term; dry, damp, moist, wet, or saturated.
Moisture Content: the weight of water in a sample divided by the weight of dry soil in the soil sample, expressed as a percentage.
Dry Density: the pounds of dry soil in a cubic foot of soil.

DESCRIPTORS OF CONSISTENCY (Ref 3)

Liquid Limit: the water content at which a - soil that will pass a #40 sieve is on the boundary between exhibiting liquid and plastic characteristics. The consistency feels like soft butter.
Plastic Limit: the water content at which a - soil that will pass a #40 sieve is on the boundary between exhibiting plastic and semi-solid characteristics. The consistency feels like stiff putty.
Plasticity Index: the difference between the liquid limit and the plastic limit, i.e. the range in water contents over which the soil is in a plastic state.

MEASURES OF CONSISTENCY OF COHESIVE SOILS (CLAYS) (Ref's 2 & 3)

Very Soft	N=0-1*	C=0-250 psf	Squeezes between fingers
Soft	N=2-4	C=250-500 psf	Easily molded by finger pressure
Medium Stiff	N=5-8	C=500-1000 psf	Molded by strong finger pressure
Stiff	N=9-15	C=1000-2000 psf	Dented by strong finger pressure
Very stiff	N=16-30	C=2000-4000 psf	Dented slightly by finger pressure
Hard	N>30	C>4000 psf	Dented slightly by a pencil point

*N=blows per foot in the Standard Penetration Test. In cohesive soils, with the 3-inch-diameter ring sampler, 140-pound weight, divide the blow count by 1.2 to get N (Ref 4).

MEASURES OF RELATIVE DENSITY OF GRANULAR SOILS (GRAVELS, SANDS, AND SILTS) (Ref's 2 & 3)

Very Loose	N=0-4**	RD=0-30	Easily push a ½-inch reinforcing rod by hand
Loose	N=5-10	RD=30-50	Push a ½-inch reinforcing rod by hand
Medium Dense	N=11-30	RD=50-70	Easily drive a ½-inch reinforcing rod
Dense	N=31-50	RD=70-90	Drive a ½-inch reinforcing rod 1 foot
Very Dense	N>50	RD=90-100	Drive a ½-inch reinforcing rod a few inches

**N=Blows per foot in the Standard Penetration Test. In granular soils, with the 3-inch-diameter ring sampler, 140-pound weight, divide the blow count by 2 to get N (Ref 4).

xxxx

GENERAL NOTES FOR BORING LOGS:

The boring logs are intended for use only in conjunction with the text, and for only the purposes the text outlines for our services. The Plate "Soil Terminology" defines common terms used on the boring logs.

The plate "Unified Soil Classification System," illustrates the method used to classify the soils. The soils were visually classified in the field; the classifications were modified by visual examination of samples in the laboratory, supported, where indicated on the logs, by tests of liquid limit, plasticity index, and/or gradation. In addition to the interpretations for sample classification, there are interpretations of where stratum changes occur between samples, where gradational changes substantively occur, and where minor changes within a stratum are significant enough to log.

There may be variations in subsurface conditions between borings. Soil characteristics change with variations in moisture content, with exchange of ions, with loosening and densifying, and for other reasons. Groundwater levels change with seasons, with pumping, from leaks, and for other reasons. Thus boring logs depict interpretations of subsurface conditions only at the locations indicated, and only on the date(s) noted.

SPECIAL NOTES FOR THIS REPORT:

FIELD AND LABORATORY NOTES

1. The borings were drilled on August 4 and 7, 2000, with a truck-mounted drilling rig using 6-inch-O.D. flight augers and 5-inch-diameter rotary-wash drilling equipment. Borings P-5 and P-6 were instrumented with a piezometer, details of which are shown on the boring logs.

2. Boring locations were approximately located by a measuring tape from known points on the site such as the building corners, walls, curbs, planters, etc. Boring elevations were estimated from the topographic drawing of the site by referenced earlier.

3. The soils' Group Names [e.g. SANDY LEAN CLAY] and Group Symbols [e.g. (CL)] were determined or estimated per ASTM D 2487, Standard Classification of Soils for Engineering Purposes (Unified Soil Classification System, see Plate 3). Other soil engineering terms used on the boring logs are defined on Plate 4, Soil Terminology.

4. The undisturbed samples were obtained in a 2½-inch-ID, 3-inch-OD, Modified California sampler lined with 6-inch-long brass liners. The samples were driven into the soil with a 140 pound hammer free-falling onto the sampling rods approximately 30 inches.

5. The "Blow Count" Column on the boring logs indicates the number of blows required to drive the sampler below the bottom of the boring, and the blow counts given are for each 6 inches of sampler penetration.

6. Groundwater was encountered in the borings on the date and at the depths indicated on the boring logs.

7. The soil samples were screened with a portable organic vapor meter with no resulting readings.

NEGATIVE DECLARATION FOR DENNY'S RESTAURANT, EA78148, PA78-153
(Pursuant to Public Resources Code Section 21000 et. sec.)

Description: The Denny's project involves the construction of a 5,963 square foot franchise restaurant. The project is to be situated on a presently vacant, 42,278 square foot parcel. Construction activities also include the erection of a 45-foot high roadway sign. Upon completion the project will contain 67 parking spaces and approximately 7,100 square feet of landscaped area.

The following city permit has been requested by the project proponent:

1. Site Plan and Architectural Review for details of construction of a 5,963 sq. ft. restaurant.

Location and Proponent: The project location is Concar Drive approximately 400 ft. west of Delaware Street, and the project proponent is Denny's, Incorporated, Larry T. Young, representative.

Findings: The project will not have a significant effect on the environment.

Initial Study: The Initial Study is attached with a brief discussion of the following impacts:

(1) Moderate - noise levels; and

(7) Minor - air quality, liquid waste disposal, storm water drainage, transportation facilities, odors, energy consumption, and views.

Mitigation Measures: None included.

Preparation: The Negative Declaration was prepared by the City of San Mateo Planning staff.

Signature and Date: Jerry Podesta (RD) 10/30/1978

REPORT OF TESTING AND OBSERVATION SERVICES
DURING GRADING OPERATIONS - BUILDING PAD ONLY

Dear Mr. Young:

At your request, our firm has provided testing and observation services during the construction of the building pad for the subject project. The grading operations have been conducted in accordance with our Soil and Geology Investigation Report, dated 7 August 1978.

Work commenced on 7 March 1979 with the excavation of approximately 3 feet of on-site material within the building pad and to a horizontal distance of 6 feet beyond the building limits. Unacceptable materials were removed from the excavated soils. The then excavated material was used as engineered fill to bring the building pad up to field grade stakes and recompacted.

Field density tests performed by our firm indicated that adequate compaction was achieved. All tests on which acceptance is based show values of 90% or greater relative compaction based on the ASTM D1557-70 Laboratory Test Procedure.

The building pad has been satisfactorily completed to the field grade stakes and is now ready to receive the proposed foundation improvements.

Summarized in Tables I and II are the results of the laboratory and field tests performed by our firm to date.

Should you have any questions regarding the contents of this letter, please do not hesitate to contact me.

Very truly yours,

REPORT OF TESTING AND OBSERVATION SERVICES DURING
GRADING OPERATIONS - PARKING AREA ONLY

Dear Mr. MacBeth:

At your request, our firm has provided testing and observation services during the grading of the proposed paved parking area for the subject project. The grading operations have been conducted in accordance with our Soil and Geology Investigation Report, dated 7 August 1978.

Work commenced on 17 September 1979 with scarifing the proposed paved parking area on the project site. An area to the rear of the building was excavated approximately two feet in order to remove some large concrete chunks and debris. The then exposed soils were scarified and compacted. The proposed paved parking area was brought up to finish subgrade with the placement of aggregate base import material and compacted.

Field density tests performed by our firm indicate that adequate compaction was achieved for the proposed paved parking area based on Laboratory Test Procedure ASTM D1557-78. All tests upon which acceptance is based show values of 95% or greater relative compaction based on the aforementioned laboratory test procedure.

The proposed paved parking area has been satisfactorily completed to the field grade stakes and is now ready to receive the proposed improvements.

Summarized in Tables I and II are the results of the laboratory and field tests performed by our firm to date.

Shell-branded Service Station
1790 South Delaware Street
San Mateo, California
SAP Code 136030
Incident No. 98996079
SMCo Site No. 110022

Dear Mr. Khatri:

Cambria Environmental Technology, Inc. (Cambria) prepared this report on behalf of Equilon Enterprises LLC dba Shell Oil Products US (Shell) in accordance with the quarterly reporting requirements of 23 CCR 2652d.

FIRST QUARTER 2006 ACTIVITIES

Groundwater Monitoring: Blaine Tech Services, Inc. (Blaine) of San Jose, California gauged and sampled the site wells, calculated groundwater elevations, and compiled the analytical data. Cambria prepared a vicinity map (Figure 1) and a groundwater contour/chemical concentration map (Figure 2). Blaine's report, presenting the laboratory report and supporting field documents, is included as Attachment A.

Additional Oxygenate Analysis: At Shell's request, samples from wells S-3, S-4, S-5B, and S-8 were also analyzed for tertiary butyl alcohol (TBA). TBA was detected in the wells S-4, S5B, and S-8 at concentrations ranging from 12 to 440 ppb.

Total Dissolved Solids (TDS) Analysis: Samples from wells S-3, S-4, and S-5B were additionally analyzed for TDS, and concentrations ranged from 950 to 33,000 milligrams per liter (mg/L). According to the June 21, 1995 Regional Water Quality Control Board (RWQCB) document titled *Water Quality Control Plan* (Basin Plan), groundwater where TDS exceeds 3,000 mg/L cannot reasonably be expected to supply a public water system.

ANTICIPATED FUTURE ACTIVITIES

Sampling Frequency Reduction Request: Cambria believes that sufficient data has been collected to date in the site wells to establish groundwater trends. Based on this, Cambria requests to reduce sampling and reporting in site wells to annual in the first quarter.

Groundwater Monitoring: Pending sampling frequency reduction approval by the San Mateo County Health Services Agency (SMCHSA), Blaine will gauge and sample all wells during the first quarter 2007 and tabulate the data. Cambria will prepare a groundwater monitoring report.

Closure Request: Based on current groundwater concentrations and TDS concentrations in site wells, Cambria believes the site meets established criteria for a low-risk groundwater site. Therefore, on behalf of Shell, Cambria requests case closure.

CLOSING

We appreciate the opportunity to work with you on this project. Please call Jacquelyn England at (707) 933-2370 if you have any questions or comments.

Sincerely,

Cambria Environmental Technology, Inc

Jacquelyn L. England
Project Geologist

Joe W. Neely, PG
Senior Project Geologist

Groundwater Monitoring Report **060109-PC-2**

This report covers the routine monitoring of groundwater wells at this Shell-branded facility. In accordance with standard procedures that conform to Regional Water Quality Control Board requirements, routine field data collection includes depth to water, total well depth, thickness of any separate immiscible layer, water column volume, calculated purge volume (if applicable), elapsed evacuation time (if applicable), total volume of water removed (if applicable), and standard water parameter instrument readings. Sample material is collected, contained, stored, and transported to the laboratory in conformance with EPA standards. Purgewater (if applicable) is, likewise, collected and transported to the Martinez Refining Company.

Basic field information is presented alongside analytical values excerpted from the laboratory report in the cumulative table of **WELL CONCENTRATIONS**. The full analytical report for the most recent samples and the field data sheets are attached to this report.

At a minimum, Blaine Tech Services, Inc. field personnel are certified on completion of a forty-hour Hazardous Materials and Emergency Response training course per 29 CFR 1910.120. Field personnel are also enrolled in annual eight-hour refresher courses.

Blaine Tech Services, Inc. conducts sampling and documentation assignments of this type as an independent third party. Our activities at this site consisted of objective data and sample collection only. No interpretation of analytical results, defining of hydrological conditions or formulation of recommendations was performed.

Please call if you have any questions.

Yours truly,

Mike Ninokata
Project Coordinator

WELL CONCENTRATIONS
Shell-branded Service Station
1790 South Delaware Street
San Mateo, CA

Well ID	Date	TPPH (ug/L)	B (ug/L)	T (ug/L)	E (ug/L)	X (ug/L)	MTBE 8020 (ug/L)	MTBE 8260 (ug/L)	DIPE (ug/L)	ETBE (ug/L)	TAME (ug/L)	TBA (ug/L)	Ethanol (ug/L)	TOC (MSL)	Depth to Water (ft.)	Screen Interval (ft.)	GW Elevation (MSL)	DO Reading (ppm)

Abbreviations:
TPPH = Total petroleum hydrocarbons as gasoline by modified EPA Method 8260B; prior to April 20, 2001 analyzed by EPA Method 8015.
BTEX = Benzene, toluene, ethylbenzene, xylenes by EPA Method 8260B; prior to April 20, 2001, analyzed by EPA Method 8020.
MTBE = Methyl tertiary butyl ether
DIPE = Di-isopropyl ether, analyzed by EPA Method 8260B
ETBE = Ethyl tertiary butyl ether, analyzed by EPA Method 8260B
TAME = Tertiary butyl methyl ether, analyzed by EPA Method 8260B
TBA = Tertiary butyl alcohol, analyzed by EPA Method 8260B
TOC = Top of Casing Elevation
GW = Groundwater
ug/L = Parts per billion
MSL = Mean sea level
ppm = Parts per million
ft. = Feet
<n = Below detection limit
(D) = Duplicate sample
DO = Dissolved Oxygen
NA = Not applicable

WELL CONCENTRATIONS
Shell-branded Service Station
1790 South Delaware Street
San Mateo, CA

Well ID	Date	TPPH (ug/L)	B (ug/L)	T (ug/L)	E (ug/L)	X (ug/L)	MTBE 8020 (ug/L)	MTBE 8260 (ug/L)	DIPE (ug/L)	ETBE (ug/L)	TAME (ug/L)	TBA (ug/L)	Ethanol (ug/L)	TOC (MSL)	Depth to Water (ft.)	Screen Interval (ft.)	GW Elevation (MSL)	DO Reading (ppm)

Notes:

a = Chromatogram pattern indicated an unidentified hydrocarbon/Hydrocarbon does not match pattern of laboratory's standard.

b = The analytic lab reports that the positive result was confirmed by a secondary column or Gas Chromatography/Mass Spectrophotometry analysis.

c = Holding time exceeded; data should be considered approximate.

d = This sample was analyzed outside of the EPA recommended holding time.

e = Pre-purge DO reading.

f = DO readings not taken due to equipment failure.

g = Top of casing elevation altered during wellhead maintenance.

h = Post-purge DO reading.

i = Quantity of unknown hydrocabon(s) in sample based on gasoline.

j = The result for this hydrocarbon is elevated due to the presence of single analyte peak(s) in the quantitation range.

* = Depth to water could not be measured because water level was above TOC.

** = On the well gauging data sheet for the October 27,1999 event, well S-5A was incorrectly measured as S-5. Values should be disregarded.

Ethanol analyzed by EPA Method 8260B.

On November 29, 1999, wells S-3, S-4, and S-7 were not analyzed for MTBE by 8020.

During the event on December 27, 1999, DO readings were taken before purging wells. MTBE was not confirmed by 8260 due to lab error.

Site surveyed June 26, 2002 by Virgil Chavez Land Surveying of Vallejo, CA.

Wells S-8 and S-9 surveyed on May 13, 2004 by Virgil Chavez Land Surveying of Vallejo, CA.

RE: 1790 S. Delaware St., San Mateo
Work Order: MPA0467

Enclosed are the results of analyses for samples received by the laboratory on 01/10/06 12:47. If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Theresa Allen
Project Manager

CA ELAP Certificate #1210

Notes and Definitions

S01	The surrogate recovery was above control limits.
QC01	The percent recovery was above the control limits.
HC-11	The result for this hydrocarbon is elevated due to the presence of single analyte peak(s) in the quantitation range.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit or MDL, if MDL is specified
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

The results in this report apply to the samples analyzed in accordance with the chain of custody document. Unless otherwise stated, results are reported on a wet weight basis. This analytical report must be reproduced in its entirety.

To: Charles Ice, San Mateo County GPP

From: ENVIRON

Re: Environmental Sampling at 470 Concar Drive and 1830 South Delaware Street

The following summarizes recent environmental sampling ENVIRON performed at two adjacent parcels, 470 Concar Drive and 1830 South Delaware Street in San Mateo (the "Property"), on behalf of Hines Interests. The Property is currently used for commercial purposes. Hines is considering acquiring the property for commercial redevelopment (no residential).

- Initial sampling event completed April 1 - 3, 2008
  - Soil, groundwater, and soil gas sampled across the site
  - No organic constituents detected in soil above ESLs
  - Benzene sporadically detected at low levels in soil gas (above ESL in one location)
  - Methane detected in soil gas above 10% of LEL at three locations
  - 1,2-DCA detected in groundwater above ESLs at two locations on 470 Concar Drive
  - No other organic constituents detected in groundwater above ESLs
- Second sampling event completed April 29 - 30, 2008
  - Soil and groundwater sampled only on 470 Concar Drive
  - Sampling event designed to investigate 1,2-DCA found in groundwater during initial sampling event
  - No VOCs detected in soil above ESLs
  - 1,2-DCA detected in groundwater above ESLs at four locations (highest concentrations at the southern site boundary)
  - No other organic constituents detected in groundwater above ESLs
- Findings and Conclusions
  - Relatively low-level and sporadic detections of petroleum hydrocarbons in soil and groundwater can be addressed through soil management plan during construction
  - Relatively low levels of VOCs and other constituents (e.g., methane) in soil gas can be addressed through assessment and (if required) control of vapor intrusion that is accounted for in construction plans
  - Relatively low levels of VOCs in groundwater encountered during construction activities are generally below City of San Mateo sewer discharge limitations
  - VOCs identified on 1830 S. Delaware Street (previously characterized and found to be acceptable to the City and County during issuance of prior project approval in 2001/2) appear to be associated with off-site gasoline service stations currently being addressed under County oversight
  - Concentrations and pattern of VOCs in groundwater on 470 Concar Drive are consistent with off-site source(s) to the south

2008 SUBSURFACE DRILLING PERMIT APPLICATION

REQUIREMENTS:

An accurate & correct map of existing and proposed well/boring locations **must** be included with the permit application. The well/boring location map **must** include the following.

1. North arrow, existing & historic site features, wells, approximate property lines and any other pertinent existing & historic features and information.
2. Proposed well/boring locations to scale.

A work plan describing the drilling and construction/destruction methodology, at a minimum, is **required** by County Staff. Upon review of information on this application and the submitted work plan, and subject to approval noted below, a permit will be issued allowing well/boring owner, driller, and responsible professional (consultant) to perform the specified work. The permit is subject to both General and Special Conditions stated below. A copy of the approved Subsurface Drilling Permit **must** be available on site while work related to the permit is being performed. Drilling date and time **must** be scheduled with County staff at least three (3) working days in advance of field work. Drilling may begin at the notified date and time whether County staff is present or not.

GENERAL CONDITIONS:

A. Well and boring construction and destruction under this permit is subject to the Standards for the Construction of Wells in San Mateo County, County Groundwater Protection Program (GPP) Guidelines, Policies & Procedures, the State Water Well Standards, and any instructions by a Health Department representative.

B. Well/Boring Owner, Driller, and Responsible Professional assume responsibility for all activities and uses under the permit, including compliance with Workmen's Compensation Laws, and indemnify, defend and save the County of San Mateo, its' officers, agents and employees, free and harmless from any and all expense, cost, or liability in connection with or resulting from work or stopped-work associated with the permit, including, but not limited to, property damage, personal injury, wrongful death, and loss of income.

C. All borings **must** be properly destroyed (grouted/sealed) within 24 hours of drilling unless special conditions are approved in writing as part of this permit.

D. Analytical results of all soil and groundwater samples collected during the execution of drilling under this permit **must** be submitted to County GPP staff by the Responsible Professional within 60 days of sample collection. If contamination is discovered during drilling, verbal notification to County GPP by the Responsible Professional is **required** within 72 hours of discovery. Proper storage, labeling & disposal of investigation-derived wastes are the responsibility of the consultant unless stated otherwise contractually.

E. In addition to the County copy of the State DWR Form 188, boring logs and well construction details for all borings/wells, signed by a Responsible Professional, **must** be submitted to County GPP by the Responsible Professional within 60 days of drilling/construction/destruction. As-built locations/dimensions **must** be finalized in subsequent report of findings submitted to County GPP by the Responsible Professional within 60 days of drilling/construction/destruction.

F. Permit is valid only for the purpose specified herein. No change in construction procedure, as described on this permit application, in the associated workplan, or in the special conditions below, will be allowed except upon written permission from the County.

G. Permit is valid for one mobilization only and is automatically canceled if not exercised, or if an extension is not applied for and granted by County GPP, within 90 days of the original permit issuance date. Failure to notify staff of cancellation or delay in start time, in a timely manner, may result in additional hourly charges to be invoiced to the consultant by GPP Staff.

H. Wells installed under this permit may not be used for domestic, municipal, commercial, or irrigation water supply.

I. All work plans and reports related to work performed under County oversight **must** conform to County GPP guidelines, Regional Water Quality Control Board guidelines, and State Water Well Standards.

J. Top-of-casing elevation of all wells **must** be surveyed to the nearest 0.01-foot relative to Mean Sea Level (NAVD88) and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate.

K. Latitude and longitude of all wells **must** be surveyed with sub-meter accuracy relative to NAD83 and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate.

L. Violation of any requirement or general or special permit condition may result in an order by GPP staff to cease work under this permit, correct the violation, and potentially re-permit the work as a new mobilization.

Analytical results of all soil and groundwater samples collected during the execution of drilling under this permit **must** be submitted to County GPP staff by the Responsible Professional within 60 days of sample collection. If contamination is discovered during drilling, verbal notification to County GPP by the Responsible Professional is **required** within 72 hours of discovery. Proper storage, labeling & disposal of investigation-derived wastes are the responsibility of the consultant unless stated otherwise contractually.

E. In addition to the County copy of the State DWR Form 188, boring logs and well construction details for all borings/wells, signed by a Responsible Professional, **must** be submitted to County GPP by the Responsible Professional within 60 days of drilling/construction/destruction. As-built locations/dimensions **must** be finalized in subsequent report of findings submitted to County GPP by the Responsible Professional within 60 days of drilling/construction/destruction.

F. Permit is valid only for the purpose specified herein. No change in construction procedure, as described on this permit application, in the associated workplan, or in the special conditions below, will be allowed except upon written permission from the County.

G. Permit is valid for one mobilization only and is automatically canceled if not exercised, or if an extension is not applied for and granted by County GPP, within 90 days of the original permit issuance date. Failure to notify staff of cancellation or delay in start time, in a timely manner, may result in additional hourly charges to be invoiced to the consultant by GPP Staff.

H. Wells installed under this permit may not be used for domestic, municipal, commercial, or irrigation water supply.

I. All work plans and reports related to work performed under County oversight **must** conform to County GPP guidelines, Regional Water Quality Control Board guidelines, and State Water Well Standards.

J. Top-of-casing elevation of all wells **must** be surveyed to the nearest 0.01-foot relative to Mean Sea Level (NAVD88) and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate.

K. Latitude and longitude of all wells **must** be surveyed with sub-meter accuracy relative to NAD83 and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate.

L. Violation of any requirement or general or special permit condition may result in an order by GPP staff to cease work under this permit, correct the violation, and potentially re-permit the work as a new mobilization.

Re: Permit Application for Environmental Soil Borings
Scope of Work
1830 South Delaware Street, San Mateo, CA (APN: 035-201-020)
470 Concar Drive, San Mateo, CA (APN: 035-202-010)

SCOPE OF WORK

ENVIRON will be performing a Phase II investigation that involves a combination of soil, ground water, and soil gas sampling, the scope of which is described below.

ENVIRON will prepare a health and safety plan, coordinate and schedule subcontractors, mark sample locations, conduct a survey of underground utilities at the proposed boring locations, and inform Underground Service Alert (USA) of the planned work at least two working days in advance of any drilling activities. Based on the results of the underground utility survey, proposed locations will be modified to avoid subsurface utilities, if necessary. San Mateo County Environmental Health Department (SMCEHD) will be notified at least 72 hours in advance of drilling, as required.

SOIL GAS SAMPLING

Although ENVIRON understands that the soil gas sampling portion of the scope of work does not require a permit from the SMCEHD, details have been provided herein so that SMCEHD staff are aware of the full scope of work to be implemented.

ENVIRON will collect soil gas samples from approximately 17 locations at the property (SG-1 through SG-17), as shown in Figure 1. At the client's request, the sampling locations were selected to provide coverage of portions of the site not improved with buildings.

Soil gas samples will be collected from an approximate depth of five feet below ground surface (bgs) using a direct push drilling rig (e.g., a Geoprobe™ or Strataprobe™ rig) and/or hand-held equipment. Soil gas samples will be collected in general conformance with the San Francisco Bay Regional Water Quality Control Board (RWQCB) and California Department of Toxic Substances Control (DTSC) *Advisory on Active Soil Gas Investigations*, dated January 28, 2003. To the extent possible, soil gas samples will be collected from approximately 5 feet bgs; however, soil gas samples may be collected between 3 and 5 feet bgs if shallow refusal is encountered at a given location following multiple drilling attempts. Soil gas samples will not be collected from depths shallower than 3 feet bgs. Soil gas probes, drilled by ENVIRON's subcontractor, will be allowed to

equilibrate for approximately 20 minutes, following which the sample tubing will be purged using a syringe. Soil gas samples will be collected directly from the sample tubing into a glass syringe and immediately analyzed for volatile organic compounds (VOCs) and methane using a mobile laboratory that is brought to the property. One duplicate sample per day will be analyzed for quality assurance/quality control (QA/QC) purposes, and one purge volume test will be conducted.

SOIL SAMPLING

Soil borings will be advanced at up to seven locations throughout the property, as shown on Figure 2 (SB-1 through SB-7).

Borings will be installed using a direct push drilling rig, which consists of a stainless steel barrel and steel cone tipped piston that will be pushed into the ground. The borings will be installed to the depth where shallow ground water is first encountered (anticipated to be encountered at depths shallower than 15 feet bgs). Continuous soil cores will be collected from each boring in acetate liners, logged, and screened in the field by an ENVIRON geologist for organic vapors using a photoionization detector (PID). A soil sample will be collected from each boring location within the vertical interval exhibiting the greatest evidence of contamination based on field screening (i.e., visual, olfactory, or PID reading). In the absence of any evidence of contamination, the sample from each boring will be collected from the 1 to 2 foot depth interval. One soil sample from each boring will be analyzed for VOCs, polyaromatic hydrocarbons (PAHs), total petroleum hydrocarbons (TPH) in the diesel, gasoline, and motor oil ranges, methyl tert butyl ether (MTBE), and metals.

GROUND WATER SAMPLING

One-time groundwater samples will be collected from the seven boring locations (SB-1 through SB-7). At the bottom of each soil boring, ground water will be sampled using a direct push sampling device consisting of a stainless steel barrel and sacrificial PVC screen and steel cone tipped piston, which will be pushed into the ground to the desired sample depth. Once the target sampling depth is reached, the tip will be released and the probe retracted approximately 2 feet to expose the screen. Ground water will then be withdrawn from the formation through small diameter tubing equipped with a check valve or through a small diameter stainless steel bailer.

The ground water samples will be analyzed for VOCs (including benzene, toluene, ethylbenzene, and xylenes), PAHs, MTBE, TPH (in the diesel, gasoline, and motor oil ranges), and metals. ENVIRON will also submit for laboratory analysis one trip blank (VOC analysis only), one duplicate sample, and one equipment blank sample for QA/QC purposes on a daily basis.

A copy of soil and ground water analytical results and boring logs will be submitted to the SMCEHD within 60 days, in fulfillment of drilling permit conditions.

BOREHOLE ABANDONMENT

Boreholes will be destroyed by grouting the borings with a neat cement grout (no bentonite, per San Mateo County requirements) to the surface. The abandonment procedures will be performed immediately upon completion of the field work.

If you have any questions regarding this scope of work, please contact Wendy Seider at 510-420-2504 or Dan Clark at 510-420-2563.

2008 SUBSURFACE DRILLING PERMIT APPLICATION

REQUIREMENTS:

An accurate & correct map of existing and proposed well/boring locations **must** be included with the permit application. The well/boring location map **must** include the following.

1. North arrow, existing & historic site features, wells, approximate property lines and any other pertinent existing & historic features and information.
2. Proposed well/boring locations to scale.

A work plan describing the drilling and construction/destruction methodology, at a minimum, is **required** by County Staff. Upon review of information on this application and the submitted work plan, and subject to approval noted below, a permit will be issued allowing well/boring owner, driller, and responsible professional (consultant) to perform the specified work. The permit is subject to both General and Special Conditions stated below. A copy of the approved Subsurface Drilling Permit **must** be available on site while work related to the permit is being performed. Drilling date and time **must** be scheduled with County staff at least three (3) working days in advance of field work. Drilling may begin at the notified date and time whether County staff is present or not.

GENERAL CONDITIONS:

A. Well and boring construction and destruction under this permit is subject to the Standards for the Construction of Wells in San Mateo County, County Groundwater Protection Program (GPP) Guidelines, Policies & Procedures, the State Water Well Standards, and any instructions by a Health Department representative.

B. Well/Boring Owner, Driller, and Responsible Professional assume responsibility for all activities and uses under the permit, including compliance with Workmen's Compensation Laws, and indemnify, defend and save the County of San Mateo, its' officers, agents and employees, free and harmless from any and all expense, cost, or liability in connection with or resulting from work or stopped-work associated with the permit, including, but not limited to, property damage, personal injury, wrongful death, and loss of income.

C. All borings **must** be properly destroyed (grouted/sealed) within 24 hours of drilling unless special conditions are approved in writing as part of this permit.

D. Analytical results of all soil and groundwater samples collected during the execution of drilling under this permit **must** be submitted to County GPP staff by the Responsible Professional within 60 days of sample collection. If contamination is discovered during drilling, verbal notification to County GPP by the Responsible Professional is **required** within 72 hours of discovery. Proper storage, labeling & disposal of investigation-derived wastes are the responsibility of the consultant unless stated otherwise contractually.

E. In addition to the County copy of the State DWR Form 188, boring logs and well construction details for all borings/wells, signed by a Responsible Professional, **must** be submitted to County GPP by the Responsible Professional within 60 days of drilling/construction/destruction. As-built locations/dimensions **must** be finalized in subsequent report of findings submitted to County GPP by the Responsible Professional within 60 days of drilling/construction/destruction.

F. Permit is valid only for the purpose specified herein. No change in construction procedure, as described on this permit application, in the associated workplan, or in the special conditions below, will be allowed except upon written permission from the County.

G. Permit is valid for one mobilization only and is automatically canceled if not exercised, or if an extension is not applied for and granted by County GPP, within 90 days of the original permit issuance date. Failure to notify staff of cancellation or delay in start time, in a timely manner, may result in additional hourly charges to be invoiced to the consultant by GPP Staff.

H. Wells installed under this permit may not be used for domestic, municipal, commercial, or irrigation water supply.

I. All work plans and reports related to work performed under County oversight **must** conform to County GPP guidelines, Regional Water Quality Control Board guidelines, and State Water Well Standards.

J. Top-of-casing elevation of all wells **must** be surveyed to the nearest 0.01-foot relative to Mean Sea Level (NAVD88) and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate.

K. Latitude and longitude of all wells **must** be surveyed with sub-meter accuracy relative to NAD83 and submitted to County GPP within 60 days of drilling, and to State GeoTracker as appropriate.

L. Violation of any requirement or general or special permit condition may result in an order by GPP staff to cease work under this permit, correct the violation, and potentially re-permit the work as a new mobilization.

Permit Application
Environmental Health Services Division
San Mateo County Health Department
455 County Center
Redwood City, CA 94063

Re: Permit Application for Additional Environmental Soil Borings
Scope of Work
470 Concar Drive, San Mateo, CA (APN: 035-202-010)

SCOPE OF WORK

ENVIRON will be performing additional borings for a Phase II investigation that involves a soil and ground water sampling, the scope of which is described below.

ENVIRON will prepare a health and safety plan, coordinate and schedule subcontractors, mark sample locations, conduct a survey of underground utilities at the proposed boring locations, and inform Underground Service Alert (USA) of the planned work at least two working days in advance of any drilling activities. Based on the results of the underground utility survey, proposed locations will be modified to avoid subsurface utilities, if necessary. San Mateo County Environmental Health Department (SMCEHD) will be notified at least 72 hours in advance of drilling, as required.

SOIL SAMPLING

Soil borings will be advanced at up to seven locations throughout the property, as shown on Figure 2 (SB-8 through SB-15).

Borings will first be advanced to approximately five feet below ground surface (bgs) to clear for underground utilities. Borings will be installed using a direct push drilling rig, which consists of a stainless steel barrel and steel cone tipped piston that will be pushed into the ground. The borings will be installed to the depth where shallow ground water is first encountered (anticipated to be encountered at depths shallower than 15 feet bgs). Continuous soil cores will be collected from each boring in acetate liners, logged, and screened in the field by an ENVIRON geologist for organic vapors using a photoionization detector (PID). A soil sample will be collected from each boring location within the vertical interval exhibiting the greatest evidence of contamination based on field screening (i.e., visual, olfactory, or PID reading). In the absence of any evidence of contamination, the sample from each boring will be collected from the interval directly overlying first encountered bay mud clay deposits. One soil sample from each boring will be analyzed for VOCs, and total petroleum hydrocarbons (TPH) in the diesel, gasoline, and motor oil ranges.

GROUND WATER SAMPLING

One-time groundwater samples will be collected from the eight boring locations (SB-8 through SB-15). As prior sampling events have indicated slow-recharging ground water in the area, one-inch diameter temporary PVC well casings screened over the bottom ten feet of each boring will be used to allow ground water to collect overnight. Temporary wells will be sealed using slip caps and hydrated bentonite to prevent surface water or other foreign matter from entering the wells. On the following day, ground water will be withdrawn from the formation through small diameter tubing equipped with a check valve or through a small diameter stainless steel or poly bailer.

The ground water samples will be analyzed for VOCs, and TPH in the diesel, gasoline, and motor oil ranges. ENVIRON will also submit for laboratory analysis one trip blank (VOC analysis only), one duplicate sample, and one equipment blank sample for QA/QC purposes on a daily basis.

A copy of soil and ground water analytical results and boring logs will be submitted to the SMCEHD within 60 days, in fulfillment of drilling permit conditions.

BOREHOLE ABANDONMENT

Boreholes will be destroyed by tremie-grouting the borings with a neat cement grout (no bentonite, per San Mateo County requirements) to the surface. The abandonment procedures will be performed immediately upon completion of the field work.

If you have any questions regarding this scope of work, please contact Wendy Seider at 510-420-2504 or Dan Clark at 510-420-2563.

1.0 SUMMARY OF CONCLUSIONS

Subject to the qualifications and limitations stated in Chapter 2.0 (Introduction), ENVIRON International Corporation (ENVIRON) was retained by Paul, Hastings, Janofsky & Walker LLP on behalf of Hines Corporation and Transwestern Investment Company, L.L.C. to perform a Phase I Environmental Site Assessment (ESA) and a Phase II investigation of 1830 S. Delaware Street and 470 Concar Drive in San Mateo, California (collectively referred to herein as the "property," the "facility," or the "site").

ENVIRON's assessment was conducted in connection with the potential redevelopment of the site. The ESA described in this report was performed in conformance with the scope and limitations of the ASTM International's (ASTM's) Practice E1527-05. Any exceptions to, or deletions from, this practice are described in Section 9.3 of this report.

Recognized Environmental Conditions

ENVIRON identified the following Recognized Environmental Condition (REC), as defined by ASTM (see Chapter 2.0), in connection with the property:

- **Identified On-Site Contamination.** As detailed in the text of this report, subsurface investigations were performed at the site in 2000 by Bay Area Geotechnical Group (BAGG) and in April 2008 by ENVIRON. ENVIRON's Phase II investigation identified 1,2-dichloroethane (1,2-DCA) in ground water as well as benzene and methane in soil gas above applicable screening levels. In addition, both the prior investigation conducted by BAGG and ENVIRON's investigation identified petroleum hydrocarbon-related constituents in soil and ground water above screening levels. Based on the information obtained during our ESA and Phase II investigation, ENVIRON considers the presence of identified contaminants in soil, ground water, and soil gas above screening levels to represent a REC. Nevertheless, the 1,2-DCA data collected by ENVIRON are consistent with the presence of an off-site source of the 1,2-DCA, possibly located to the south of the subject property. Similarly, ENVIRON believes that the benzene and other petroleum hydrocarbons have likely resulted (at least in part) from releases at off-site service stations in the immediate vicinity of the subject property. Elevated methane concentrations in soil gas are likely associated with decomposition of organic matter in naturally-occurring soils beneath the on-site fill.

It is ENVIRON's understanding that the subject property may undergo redevelopment, whereby the two existing buildings on the site would be demolished and replaced with office buildings and associated underground parking structures. ENVIRON believes that (if necessary) properly designed and readily-available engineered controls (passive or active vapor barriers), as well as the currently planned underlying parking garage, are likely to provide sufficient mitigation measures to address potential vapor intrusion concerns at the property associated with the identified contamination. In addition, the ground water sampling data suggest that wastewater potentially generated during site construction through dewatering activities could likely be discharged to the municipal sanitary sewer, particularly if a treatment system is employed. Further, the limited soil sampling performed by ENVIRON did not identify contaminants that would clearly necessitate disposal of excavated site soils as hazardous waste during potential site redevelopment activities, although additional sampling of excavated materials would be necessary to confirm that the concentration of constituents present in site soils do not exceed hazardous waste criteria.

Significant Data Gaps

ENVIRON did not identify any Significant Data Gaps, as defined by ASTM (see Chapter 9.1), associated with the site.

De minimis conditions, as defined in Chapter 2.0, along with other site conditions observed during the site visit are discussed within relevant sections of this report, and are summarized in Chapter 9.0.

2.0 INTRODUCTION

2.1 Purpose

ENVIRON was retained by Paul, Hastings, Janofsky & Walker LLP on behalf of Hines Corporation and Transwestern Investment Company, L.L.C. to conduct a Phase I ESA and a Phase II investigation of 1830 S. Delaware Street and 470 Concar Drive in San Mateo, California. ENVIRON's assessment and investigation were conducted in connection with the potential redevelopment of the site. The purpose of the Phase I ESA was to identify RECs, which are defined in ASTM International's *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process* E-1527-05 (the "ASTM Standard") as:

> "The presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, ground water, or surface water of the property. The term includes hazardous substances or petroleum products even under conditions in compliance with laws. The term is not intended to include *de minimis* conditions that generally do not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. Conditions determined to be *de minimis* are not recognized environmental conditions."

2.2 Scope of the Phase I ESA

ENVIRON undertook the following tasks, consistent with the ASTM Standard, to complete the Phase I ESA of the property:

- A visit to the property by Wendy Seider of ENVIRON on February 22, 2008 to observe and evaluate visible site conditions.

- An interview conducted during the site visit with Jeff Atkinson, owner of Concar Enterprises, Inc. (CEI), which has leased and occupied the building at 470 Concar Drive since approximately 1999. Mr. Atkinson is also a partner in the family trusts that own the entire subject property (1830 South Delaware, L.P.; Concar 1830 SD Property, LLC; and

Smith 470 C Property, LLC), and he has generally been involved with the subject property since 1991.

- A brief interview conducted during the site visit with Richard Stern, owner of Telecenter Appliances TV Video (Telecenter), which occupies 1830 S. Delaware Street. Mr. Stern has been employed at the site since Telecenter initiated site operations in 1981.

- A review of documents related to the site provided to ENVIRON by facility personnel or the client. Key documents reviewed included lease agreements, subcontractor invoices, correspondence with the city and county, a monitoring well access agreement with the adjacent Shell service station, documentation regarding the proposed site redevelopment, and the following prior environmental reports:

  - *Phase I/II Environmental Assessment, Telecenter, 1830 South Delaware Street, San Mateo, California*, prepared by Bay Area Geotechnical Group (BAGG), dated June 30, 2000 (the "BAGG Phase I/II for 1830 S. Delaware Street").
  - *Geotechnical Investigation, Proposed Two-Story Office Building, Former Denny's Site, 470 Concar Drive, San Mateo, California*, prepared by BAGG, dated October 30, 2000.
  - *Phase I/II Environmental Assessment, Former Denny's Site, 470 Concar Drive, San Mateo, California*, prepared by BAGG, dated November 7, 2000 (the "BAGG Phase I/II for 470 Concar Drive").
  - *Geotechnical Investigation, Proposed Office Building & Parking Structure, Telecenter Site 1830 S. Delaware Street, San Mateo, California*, prepared by BAGG, dated February 27, 2001.

  Copies of these key environmental reports are included as Appendix E of this report.

- A review of a search of environmental regulatory agency data base records conducted by Environmental Data Resources, Inc. (EDR) in February 2008 for the site and off-site properties in the vicinity of the site. A copy of the EDR radius report is included as Appendix B. The radius searched for individual data bases, as well as the data bases themselves, were selected in accordance with the ASTM Standard. EDR conducted searches of federal data bases including: National Priorities List; Comprehensive Environmental Response, Compensation, and Liability Information System; Emergency Response Notification System; Corrective Action Report; and Resource Conservation and Recovery Information System. California state data bases searched included: Cal-Sites;

California Bond Expenditure Program; School Property Evaluation Program; Toxic Pits Cleanup Act Sites; Solid Waste Information System; Waste Management Units Database; California Waste Discharge System; Cortese; Recycler Database; Leaking Underground Storage Tanks (LUST); Spills, Leaks, Investigations, and Cleanups (SLIC); Facility Inventory Database; Underground Storage Tanks (UST); Historical USTs; Aboveground Petroleum Storage Tanks (AST); Environmental Liens Listing; Statewide Environmental Evaluation and Planning System; California Hazardous Material Incident Report System; Proposition 65 Records (Notify 65); Deed Restriction Listing; Voluntary Cleanup Program; Drycleaner Facilities; Well Investigation Program Case List; Clandestine Drug Labs; State Response Sites; Facility and Manifest Data; Emissions Inventory Data; EnviroStor; and Registered Waste Tire Haulers Listing. The dates of the most recent updates for the aforementioned environmental data bases are listed in the data base report in Appendix B.

Because the environmental data bases themselves are sometimes not updated by the specific regulatory agencies for a period of up to one year or more (depending on the data base and the agency), the data base search conducted herein will not necessarily list any facility or site recently identified as having, or which is suspected of having, environmental problems and/or for which an environmental investigation/listing has been initiated, or reflect the current status of activities at a particular site, subsequent to the last update of a given list. In addition, the EDR data base search contained a number of unmapped sites. It was beyond the scope of this review to locate each of the unmapped sites.

- A review of information pertaining to the topography, geology, and hydrogeology of the area, as provided in the EDR report and the prior geotechnical investigations.

- An interview with Tania Cacayorin of the San Mateo County Health Department, Environmental Health Division (Health Department) on February 26, 2008 regarding potential contamination concerns at the site. According to Ms. Cacayorin, the Health Department does not maintain any files for the property related to hazardous materials or waste, past release incidents, or other contamination concerns. In addition, ENVIRON contacted the City of San Mateo Fire Department, which indicated that all environmental-related records for the site would be located at the Health Department.

- Environmental information related to contamination at adjacent off-site properties obtained from the State Water Resources Control Board (SWRCB) Geotracker data base, including the following prior environmental reports:

Shell Station at 1790 S. Delaware Street:

- "Underground Storage Tank Removal Report, Shell-branded Service Station, 1790 South Delaware Street, San Mateo, California, SAP Code 136030, CRA Project No. 200336-001," prepared by Cambria Environmental Technology, Inc. (Cambria), dated September 10, 2007.
- "Case Closure Summary Addendum, Shell-Branded Service Station, 1790 South Delaware Street, San Mateo, California, SAP Code 136030, Incident No 98996079, SMCo Site No. 110022," prepared by Contestoga-Rovers Associates (CRA), dated June 15, 2007.
- "Groundwater Monitoring Report – First Quarter 2007, Shell-branded Service Station, 1790 South Delaware Street, San Mateo, California, SAP Code 136030, Incident No 98996079, SMCo Site No. 110022," prepared by Cambria, dated February 23, 2007 (the "First Quarter 2007 Shell Groundwater Monitoring Report").
- "Case Closure Summary, Shell-branded Service Station, 1790 South Delaware Street, San Mateo, California, SAP Code 136030, CRA Project No. 200336-001," prepared by Cambria, dated May 4, 2006.

Former Exxon Station at 1801 S. Delaware Street:

- "Groundwater Monitoring Report, Third Quarter 2007, Former Exxon Service Station 7-4135, 1801 South Delaware Street, San Mateo, California," prepared by Environmental Resolutions, Inc. (ERI), dated October 18, 2007.
- "Remedial Action Work Plan, Former Exxon Service Station 7-4135, 1801 South Delaware Street, San Mateo, California," prepared by ERI, dated April 16, 2007.
- "Status of Remedial Action, Former Exxon Service Station 74135, 1801 S Delaware Street, San Mateo, California," prepared by ERI, dated December 14, 2007.

ARCO and Former BP Stations at 1950 S. Delaware Street and 404 E. 19th Street

- *Quarterly Groundwater Monitoring Report Third Quarter 2007, ARCO Service Station No. 4495, 1950 South Delaware Street, San Mateo, California*, prepared by SECOR International Incorporated, dated October 29, 2007.

- A review of standard historical sources, as defined in the ASTM Standard, to develop a history of the previous uses of the site and surrounding area. Sources of historical information reviewed included:

  - Available aerial photographs for the property and vicinity, dated 1943, 1956, 1965, 1974, 1982, 1993, and 1998, provided by EDR (as shown in Appendix C.1).

  - Historical fire insurance maps covering the property and/or vicinity, dated 1920, 1950, 1953, 1956, 1961, and 1969, provided by EDR (as shown in Appendix C.2).

  - Available historical topographic maps for the property and vicinity, dated 1899, 1947, 1949, 1956, 1968, 1973, 1980, and 1993, provided by EDR (as shown in Appendix C.3).

  - An abstract of City Directory information for the property address and vicinity for listings dated approximately every five years between 1976 and 2006, provided by EDR (as shown in Appendix C.4).

  - Historical information pertaining to the property from the San Mateo County Assessors Office (Assessors Office) and the City of San Mateo Building Department (Building Department).

- A review of results from a Phase II environmental site investigation performed by ENVIRON at the property in April 2008.

2.3 Significant Assumptions

In conducting this review, no significant assumptions were made, except for the following.

- Site-specific field measurements of depth to ground water collected during the current and prior subsurface investigations at the site were not sufficient to definitively determine ground water flow direction at the site. In the absence of such data, ENVIRON has assumed that the flow direction of shallow ground water beneath adjacent sites and in the general area would serve as a general indication of ground water flow direction beneath the subject property. In evaluating potential on-site impacts from off-site sources, therefore, those off-site facilities not located adjacent to or within one-quarter mile in a potentially upgradient direction are not considered to represent a significant concern to the subject site. This interpretation is based on the assumption that a hazardous material released to

the subsurface generally does not migrate laterally within the unsaturated soil for a significant distance, although a hazardous material can migrate in the ground water in a generally downgradient direction.

2.4 Special Terms and Conditions

This assessment was conducted in accordance with ASTM Standard E1527-05, as agreed upon by ENVIRON and Hines Corporation in February 2008. Issues considered outside the scope of the ASTM Standard and this assessment include asbestos-containing materials, radon, lead-based paint, lead in drinking water, regulatory compliance, cultural and historic resources, industrial hygiene, health and safety, ecological resources, endangered species, indoor air quality, and high voltage power lines. Although identified as non-scope considerations under the ASTM Standard, this assessment included the following additional tasks:

- A Phase II environmental site investigation of the property; and
- A review of a current National Wetlands Inventory (NWI) map of the surrounding area to note if the property is identified as a federally-designated wetland area.

2.5 User Reliance

This assessment has been prepared exclusively for use by Paul, Hastings, Janofsky & Walker LLP; Hines Corporation; and Transwestern Investment Company, L.L.C. and may not be relied upon by any other person or entity without ENVIRON's express written permission. The report is considered current only for a period of 180 days from the date of the facility site inspection. The findings, opinion and conclusions presented in this report represent ENVIRON's best professional judgment based upon the information available and conditions existing as of the date of the review. In performing its assignment, ENVIRON must rely upon information obtained from the client and facility personnel, publicly available information, and information provided by third parties. Accordingly, the conclusions in this report are valid only to the extent that the information provided to ENVIRON was accurate and complete. ENVIRON found no reason to question the validity of information received unless explicitly noted elsewhere in this report.

ENVIRON's scope of work for this assignment included the completion of a Phase II environmental site investigation of the property. Regardless, this assessment cannot rule out the existence of latent conditions, and is intended, consistent with normal standards of practice and care, to assist the client in identifying the risks of such conditions.

This report is not intended as a substitute for legal advice, nor is it an exhaustive review of site conditions. ENVIRON makes no representations or warranties about the condition of the property.

3.0 SITE DESCRIPTION

3.1 Location and Legal Description

The property is located at 1830 S. Delaware Street and 470 Concar Drive in San Mateo, San Mateo County, California. The location of the site is shown on the United States Geological Survey (USGS) topographic map for the San Mateo, California quadrangle, as shown in Figure 1. A detailed legal description of the property was not readily available at the time of this assessment.

3.2 Site and Vicinity General Characteristics

The site is comprised of two adjacent parcels that are located in a mixed light industrial and commercial area in San Mateo, California, approximately 20 miles south-southeast of downtown San Francisco. The 1830 S. Delaware Street parcel consists of approximately 2.26 acres, and the 470 Concar Drive parcel consists of approximately 1.05 acres.

An overview of physical setting and utility information for the site is presented in Table 1.

TABLE 1
Physical Setting and Utility Information for 1830 S. Delaware Street and 470 Concar Drive in San Mateo, CA

Conditions	Source	Description
Topography		
Elevation (above mean sea level)	USGS topographic map (San Mateo, California, 1993)	Approximately 8 feet above mean sea level (amsl).
Topographic Gradient	USGS topographic map; visual observations	Relatively flat on-site, with a steep embankment on the southern side adjacent to Highway 92. Regional topography slopes generally downward to the east-northeast
Hydrology		
Surface Water Runoff	Visual observations	Storm water generally runs via sheet flow into storm drains located on-site and in the adjacent streets.
Nearest Surface Water Body	USGS topographic map; visual observations	Seal Slough, located approximately three-quarter miles east of the site at its closest point. San Francisco Bay is located approximately 1.5 miles north of the site at its closest point.
Flood Plain	FEMA*; facility personnel	The EDR report does not identify the site within the 500-year flood zone, although information provided by the client suggests that the site may be located within the 100-year flood zone. Facility personnel reported no known occurrences of flooding at the site.
Wetlands	NWI*	No federally designated wetlands were identified on the site.

TABLE 1
Physical Setting and Utility Information for 1830 S. Delaware Street and 470 Concar Drive in San Mateo, CA

Conditions	Source	Description
Geology and Hydrology		
Presumed Direction of Shallow Ground Water Flow	Various subsurface investigations at surrounding properties	Although regional ground water is expected to flow to the northeast (towards San Francisco Bay), measured flow direction at nearby locations has been highly variable. Closest to the site, ground water flow from the adjacent Shell service station has generally been measured in a south-southeasterly direction. Ground water flow direction at the adjacent former Exxon service station is highly variable and seasonally dependent. Ground water at the adjacent Arco station has been measured in a generally easterly direction.
Depth to Ground Water	Bagg Phase I/II Reports, ENVIRON Phase II sampling	On-site depth to ground water measurements have ranged from 2 to 16 feet below ground surface (bgs).
On-site Wells	Facility personnel; visual observations	ENVIRON observed several monitoring wells on-site (see Section 6.2.7). No production wells are present.
Nearest Ground Water Supply Wells	EDR data base report	One federal well and 43 other ground water monitoring points are located within one mile of the site. None of the wells appear to be public water supplies.
Geologic Conditions	Bagg Phase I/II Reports; Bagg Geotechnical Investigations	The general site area is underlain by Holocene Estuarine Mud, an unconsolidated water-saturated bay mud (0 to 40 meters thick) overlain by artificial fill. The geotechnical investigations generally identified a 3 to 5.5-foot layer of highly variable fill soils overlying 2 to 6 feet of soft, young bay deposits, which in turn are on top of generally stiff and dense alluvial soils.
Site Utility Information		
Electricity Supplier	Facility personnel	Pacific Gas & Electric
Natural Gas Supplier	Facility personnel	Pacific Gas & Electric
Use of Fuel Oil	Facility personnel	No current or former use of fuel oil reported.
Water Supplier	Facility personnel; City personnel	California Water, which purchases its water from the City and County of San Francisco.
Sanitary Sewer	Facility personnel	City of San Mateo.
Septic Systems	Facility personnel	No current or former septic systems reported.

Notes:
FEMA = Federal Emergency Management Agency; NCCS = National Cooperative Soil Survey ; NWI = National Wetlands Inventory
* - Source was provided in the EDR data base report.

3.3 Current Use of Property

The 1830 S. Delaware Street parcel is leased and operated by Telecenter for retail sales of appliances and electronics. The eastern portion of the building consists of a retail showroom, where Telecenter displays electronics (e.g., televisions, stereos) and appliances (e.g., refrigerators, washers, dryers). The western portion of the building is used for the warehousing and storage of new merchandise and used appliances (collected from customers during delivery of new appliances and ultimately sent off-site for recycling).

The 470 Concar Drive parcel is leased and operated by CEI for use as office and storage space. CEI maintains offices on the northern portion of the building. The remainder of the building is largely vacant, except for storage of certain personal belongings by Mr. Atkinson and his family.

No chemicals are maintained at the site, other than limited quantities of retail-sized janitorial chemicals.

3.4 Description of Structures, Roads, and Other Improvements

The 1830 S. Delaware Street parcel consists of an approximate 2.26-acre, irregular-shaped parcel improved with an approximate 30,230-square foot building, as shown in Figure 2. Areas surrounding the building consist of paved parking areas to the north and south, a vehicular accessway to the west, and a grassy area and paved vehicular accessway on the eastern side. Waste dumpsters are located outside the southwestern portion of the building. A paved entryway on the eastern side provides access to S. Delaware Street.

The 470 Concar Drive parcel consists of an approximate 1.05-acre, roughly triangular-shaped parcel improved with an approximate 5,980-square foot building. Areas surrounding the building consist of paved parking areas on the western and eastern sides, a paved vehicular accessway on the southern side, and a landscaped area on the northern side. A small grassy area is also present on the far western end of the parcel. Paved entryways on the northern side provide access to Concar Drive.

The site is owned by 1830 South Delaware, L.P.; Concar 1830 SD Property, LLC; and Smith 470 C Property, LLC. The on/off ramp for Highway 92 bisects the two site parcels. There are no on-site surface water bodies.

Pacific Gas & Electric provides electricity for the site. A pad-mounted transformer was observed to the southeast of the 470 Concar Drive building, which is reportedly utility-owned. Natural gas is also provided to the site by Pacific Gas & Electric. Air conditioning units associated with the buildings' heating, ventilation and air conditioning (HVAC) systems are reportedly located on the roofs, which are serviced by an outside contractor.

Potable water and sanitary sewer services are supplied to the site by the City of San Mateo. Mr. Atkinson was not aware of a septic system ever having been used or located at the property. Solid wastes generated on the property are currently transported off-site for handling and disposal.

3.5 Current Uses of Adjoining Properties

Based on representations by facility personnel, ENVIRON's visual observations from the property boundaries and public rights-of-way, and a limited review of publicly available information, a general determination of the current use of adjacent properties was developed. The area in the nearby vicinity of the property is used for commercial purposes, as described below:

- North: Concar Drive, beyond which are retail establishments (K-Mart, Michaels) and a Shell service station.
- East: Delaware Street, beyond which is a shopping center with retail establishments (Ross Dress for Less, Rite Aid, Circuit City, Peninsula Grill).
- South: A berm and then Highway 92.
- West: Concar Drive, beyond which is the Hayward Park commuter rail station.

4.0 USER PROVIDED INFORMATION

Hines Corporation personnel provided ENVIRON with a completed User Questionnaire (consistent with Appendix X3 of the ASTM Standard). Applicable elements of the questionnaire are discussed in appropriate sections of this report.

5.0 RECORDS REVIEW

5.1 Environmental Regulatory Data Base Review

To assess the potential for soil and/or ground water contamination at the property due to on- and off-site sources, ENVIRON conducted a review of federal and state regulatory data base lists of environmental data bases and requested files for the property from local environmental and other regulatory agencies. In particular, ENVIRON contracted with EDR in February 2008 to conduct a review of federal and state regulatory agency data bases for the site and facilities in the vicinity of the property. EDR conducted an environmental regulatory data base search of sites located within applicable radii of the property, as recommended by the ASTM standard.[1] A copy of the EDR report is presented in Appendix B.

ENVIRON reviewed the results of EDR's search. The subject property is not listed on any of the environmental data bases searched. There are several listings in the EDR report for off-site facilities within applicable ASTM search radii. Several of these listings (e.g., hazardous waste generators, facilities with registered storage tanks, solid waste recycling facilities, dry cleaners), by themselves, are not necessarily indicative of an environmental concern, and these listings are therefore not discussed herein. A number of sites appear on data bases indicative of potential contamination concerns (e.g., LUST, Cortese, SLIC, Notify 65, and EnviroStor). Of these latter facilities, only those that are located adjacent to or within one-quarter mile upgradient of (but not necessarily adjacent to) the property and are listed with an active status (i.e., regulatory closure has not been granted) are discussed in this section. These facilities were selected based on the assumption that a hazardous material released to the subsurface generally does not migrate laterally within the unsaturated soil for a significant distance, although a hazardous material can migrate in ground water in a generally downgradient direction; however, there are limitations to this interpretation.

- A Shell service station located adjacent to the north of the 1830 S. Delaware Street parcel (at 1790 S. Delaware Street) is listed on the LUST and Cortese data bases for a release of gasoline reported in 1990 that has resulted in contamination to ground water. Remedial action is reportedly underway to address the contamination. Additional discussion of contamination concerns associated with this property is presented in Section 5.2.9 below.

[1] The ASTM standard uses the terminology "approximate minimum search distance" to refer to the radii searched in the environmental data base report with respect to the property.

- A former Exxon service station previously located adjacent to the east of the 1830 S. Delaware Street parcel (at 1801 S. Delaware Street) is listed on the LUST and Cortese data bases for a release of miscellaneous motor vehicle fuels reported in 1986 that has resulted in contamination to ground water. The current status of the listing is "Remediation Plan." Additional discussion of contamination concerns associated with this property is presented in Section 5.2.9 below.

- An Arco service station located adjacent to the south of the 1830 S. Delaware Street parcel (at 1950 S Delaware Street, across Highway 92) is listed on the LUST and Cortese data bases for a release of miscellaneous motor vehicle fuels reported in 1992 that has resulted in contamination to ground water. The current status of the site is listed as "post remedial action monitoring." Additional discussion of contamination concerns associated with this property is presented in Section 5.2.9 below.

- A former BP service station located adjacent to the southeast of the 1830 S. Delaware Street parcel (at 404 19th Avenue, across Highway 92) is listed on the LUST and Cortese data bases for a release of diesel fuel reported in 1986 that has resulted in contamination to ground water. The current status of the site is listed as "post remedial action monitoring." Additional discussion of contamination concerns associated with this property is presented in Section 5.2.9 below.

- Kmart, located adjacent to the north of the 470 Concar Drive parcel (at 1700 Delaware Street) is listed on the Notify 65, LUST, and Cortese data bases. The LUST listing relates to a release of miscellaneous motor vehicle fuels reported in 1989 that resulted in contamination to ground water, which has been granted regulatory closure. No information is available regarding the Notify 65 and Cortese listings.

- The City of San Mateo corporate yard, located adjacent to the south of the 470 Concar Drive parcel (at 1949 Pacific Boulevard) is listed on the LUST, Cortese, and Notify 65 data bases. The LUST listing relates to a release of miscellaneous motor vehicle fuels reported in 1989 that resulted in contamination to soil only, which has been granted regulatory closure. No information is available regarding the Notify 65 and Cortese listings.

- In addition to the adjacent properties described above, a large number of properties within applicable ASTM search radii of the subject property are listed on the LUST, Cortese,

SLIC, EnviroStor, and Notify 65 data bases related to contamination matters. Some of these listings involve confirmed contamination to ground water that has not been issued regulatory closure.

The EDR report indicates that poor or inadequate address information was identified for several sites located in the vicinity of the property; therefore, these sites could not be readily mapped by EDR. Because the location of these sites with respect to the property could not be evaluated, ENVIRON is limited in its ability to express an opinion regarding the potential for impact to the property from these sites. Although ENVIRON reviewed the list of unmappable sites for any adjacent or nearby properties observed during the site visit, locating each of the unmapped sites identified by EDR is not considered to be practically reviewable. Based on ENVIRON's review, no unmapped sites were adjacent to the property.

5.2 Historical Use Information on the Site and Surrounding Area

To evaluate the historical uses of the property, ENVIRON interviewed CEI and Telecenter personnel and, where readily available, reviewed historical aerial photographs, fire insurance maps, topographic maps, an abstract of City Directory information, and prior environmental reports. In addition, ENVIRON reviewed information from local government agencies and property documentation available at CEI's office. The results of ENVIRON's historical review are presented below.

5.2.1 Historical Operations Interview

ENVIRON interviewed Jeff Atkinson, owner of CEI, which has reportedly leased and occupied the building at 470 Concar Drive since approximately 1999. Mr. Atkinson is also a partner in the family trusts that own the entire subject property (1830 South Delaware, L.P.; Concar 1830 SD Property, LLC; and Smith 470 C Property, LLC), and he has generally been involved with the subject property since 1991. According to Mr. Atkinson, both subject parcels were originally part of a larger property used by Leslie Salt for production of salt. Mr. Atkinson's family acquired the properties in the 1950s or 1960s. At that time, fill material was reportedly brought on-site associated with construction of Highway 92.

According to Mr. Atkinson, the 1830 S. Delaware Street parcel was developed with the current site building in the 1950s or 1960s. At that time, the building was used as a bowling alley (first leased by 19th Street Bowl and later by American Recreation Centers [ARC]). Originally, the front (i.e., eastern) portion of the building was used as a restaurant associated with the bowling alley, but Telecenter (the current site occupant) began sub-leasing this space from the bowling alley for the sale of electronics and appliances in the early 1980s. Later in

the 1980s, the bowling alley closed down, and Telecenter began leasing the entire building for the current sales and warehousing activities.

With respect to the 470 Concar Drive parcel, Mr. Atkinson reported that the existing building was leased out from its construction in the 1970s until 1999 as a Denny's Restaurant. The building was renovated in 1999, and has since been occupied by CEI for the current office-related activities. Mr. Atkinson reported that his brother's company (Atco Enterprises) had also used the building for office space. A separate company (Patrick Flooring Inc) had performed wood varnishing and storage in the rear of the building for approximately one year in the late 1990s or early 2000s, and Draegers had leased a portion of the building for several months in 2000 for storage of Christmas gift baskets.

ENVIRON also briefly interviewed Richard Stern, owner of Telecenter, which occupies 1830 S. Delaware Street. Mr. Stern reported that Telecenter initiated site operations in 1981 in the eastern portion of the building, and expanded to the remainder of the building in the late 1980s when the bowling alley closed down. According to Mr. Stern, Telecenter's operations have remained generally unchanged since the company took over the entire building for warehousing and sales activities in the late 1980s. Mr. Stern believed that a service station may have been located at or near the site prior to the construction of the existing bowling alley in the 1950s. ENVIRON did not identify any documentary evidence to support this statement.

Neither Mr. Atkinson nor Mr. Stern were aware of any past significant chemical usage or storage or of potential contamination concerns associated with the property.

5.2.2 Aerial Photographs

Historical aerial photographs dated 1943, 1956, 1965, 1974, 1982, 1993, and 1998 were obtained from EDR (scales ranged from one inch equals 333 feet to one inch equals 690 feet). Copies of these photographs are included in Appendix C.1. Based on ENVIRON's review, the following chronology is presented:

1943 – The subject property appears to contain several small ponds on the eastern side and several small buildings on the western side. Immediately to the north of the site are a number of buildings and larger ponds (possibly associated with salt refining). A rail line is visible adjacent to the west of the site, beyond which is commercial/residential development. Land to the south (beyond 19th Avenue) and east appears to be undeveloped and/or agricultural.

1956 – A series of small buildings extend across the subject property and the adjacent property to the south (along the northern side of 19th Avenue). Delaware Street is now visible to the east of the site, beyond which are small buildings and a storage yard. An

unknown industrial operation is present across 19th Avenue to the south of the site. The area west of the site across the rail line remains commercial/residential. A number of small buildings and disturbed ground (possibly associated with gravel excavation or piles) are present to the north.

1965 and 1974 – Highway 92, associated on/off ramps, Concar Drive, and Delaware Street are present largely in their current configurations. The 1830 S. Delaware Street parcel is improved with the existing building and surrounding parking areas. No development is visible on the 470 Concar Drive parcel. Across Concar Drive to the north of the site, industrial and commercial operations are present, and a service station appears to be present in the location of the existing Shell station. Land to the west of the site remains commercial/residential, beyond the rail line. Highway 92 and then 19th Avenue are present to the south of the site, beyond which is industrial or commercial development (possibly including service stations at the intersections of 19th Avenue and Delaware Street). The property across Delaware Street to the east of the site remains undeveloped on the 1965 photograph and is improved with the existing shopping center (including what appears to be a service station at the southeastern intersection of Delaware Street and Concar Drive) on the 1975 photograph.

1982, 1993, and 1998 – In these photographs, the subject property and surrounding sites appear generally in their current form, except that the presumed service station is still present to the northeast of the site.

5.2.3 Historical Fire Insurance Maps

Historical fire insurance maps dated 1928, 1938, 1947, 1952, 1968, 1976, 1989, 1994, and 2002 were obtained from EDR. Some of these maps cover the southern portion of the subject property, and all of them cover properties just north of the site. Copies of these maps are included in Appendix C.2. Based on ENVIRON's review, the following chronology is presented:

1908 – The subject property does not appear to be covered on this map. However, a Leslie Salt Refining Co facility (including a sterilizing house, salt storage, two large oil tanks, two large brine tanks and a rail spur) is depicted in close proximity to the north-northwest of the subject property.

1920 – The subject property does not appear to be covered on this map. Immediately north-northwest of the 470 Concar Drive parcel are a salt works facility operated by

Whitney Chemical Co and then the Leslie Salt Refining Co facility previously identified on the 1908 map. Chemical storage tanks are depicted at several locations at these facilities, including an oil tank area (possibly belowground) on the far southern end of the manufacturing complex (apparently just north of the subject property). A transformer house is depicted on the far northern end of the complex.

1950 – The subject property does not appear to be covered on this map. The former locations of the salt refining facilities are now depicted as vacant, except for a rail spur through the center of the site (in a generally north-south direction) and a transformer house on the far northwestern corner of the property.

1953 – The subject property does not appear to be covered on this map. The adjacent property to the north-northwest is now developed with a facility operated by Building Products Inc (primarily a cement warehouse with a small oil warehouse on the northern end). To the north of this facility is an asphalt plant operated by L.C. Smith Co (containing a hot asphalt mixing plant, dust collection areas, and various gravel and oil storage locations).

1956 – The southern portion of the subject property is depicted on this map. Although the specific site boundaries cannot be discerned because roads have been reconfigured since that time, the 470 Concar Drive parcel and adjacent land to the south (extending to 19th Avenue) are improved with a storage yard, several buildings (a truck repair shop, an automotive repair shop, a welding building, a storage building, and an office), and a portion of a rail spur associated with the L.C. Smith Co asphalt plant. In addition, an oil house is located on the northeastern corner of the storage yard, possibly in a location that is now under the on/off-ramp for Highway 92. The 1830 S. Delaware Street parcel is part of a larger facility (unlabeled) at the northwestern intersection of S. Delaware Street and 19th Avenue that contains a tire servicing building, two automotive servicing buildings, and a vacant building. To the north-northwest of the subject property, the Building Products Inc. facility is now identified as Pacific Coast Aggregates and the L.C. Smith Co. asphalt plant appears generally similar to its appearance in 1953.

1961 – The southern portion of the 470 Concar Drive parcel appears essentially unchanged from its appearance on the 1956 map. With respect to the 1830 S. Delaware Street property, the central portion of the existing building is depicted on the map as a bowling alley and restaurant (the central and northern portions of the site are not covered on the map), to the south of which are the automotive servicing/repair buildings depicted on the

1956 map (except one building designated as vacant in 1956 that is no longer present). To the north-northwest of the subject property, the Pacific Coast Aggregates facility is now labeled as Pacific Cement & Aggregates Inc and is identified as not in operation, and the L.C. Smith Co. asphalt plant appears generally similar to its appearance in 1956.

1969 – Surrounding streets, including Concar Drive, Highway 92, and the Highway 92 on/off ramps, are now depicted. The southern portion of the 470 Concar Drive parcel appears essentially unchanged from its appearance on the 1961 map, but a label on the 1969 map suggests that the buildings had actually been removed by that time. With respect to the 1830 S. Delaware Street parcel, the bowling and restaurant building depicted in 1961 has been expanded to the south (the northern portion of the building is not covered on the map). To the north of the subject property, the aggregates facility has been removed but the L.C. Smith Co asphalt plant remains generally similar to its appearance in 1961.

5.2.4 Assessors Files

ENVIRON obtained records for the site from the San Mateo County Assessors Office website. These records indicate that 470 Concar Drive has an assessors parcel number of 035-202-010 and is 1.05 acres in size. The 1830 S. Delaware Street parcel has an assessors parcel number of 035-201-020 and is 2.2594 acres in size.

5.2.5 Building Department Records

ENVIRON reviewed records on file with the San Mateo Building Department, the most relevant of which are summarized below:

<u>1830 S. Delaware Street</u>

- Various correspondence and permits indicate that the 19th Avenue Bowl building was constructed by Concar Ranch Enterprises Inc. in 1956 for use as a bowling alley. The original building was approximately 22,400 square feet.
- Various correspondence from 1965 indicate that the 19th Avenue Bowl building underwent an eight-lane extension.
- Various correspondence and permits from 1979 indicate the 19th Avenue Bowl building was remodeled to add 553 square feet to an existing snack bar (The Greenhouse Restaurant).
- Correspondence indicates the bowling alley was operated by American Recreation Centers, Inc. (ARC) as The Fun Bowl – 19th Avenue as of 1982, and that Telecenter sub-leased space at the property at least by 1986.

- Steve's Christmas Trees filed a building permit application in 2002 for a temporary installation.

470 Concar Drive

- A Certificate of Occupancy was issued to Denny's for a restaurant in November 1979.
- Building permits were issued to Denny's and its subcontractors for tenant improvements between 1989 and 1998 (owner was listed as Bank of California Trust, University National Bank/Comerica, and most recently Borel Bank & Trust Company).
- In 2001, a building permit was issued to CEI for remodeling of 1,002 square feet inside the former Denny's Restaurant as office space (site owner was listed as Borel Bank & Trust Company).

5.2.6 Historical Topographic Maps

ENVIRON requested historical topographic maps for the property from EDR. Maps from 1899, 1947, 1949, 1956, 1968, 1973, 1980, and 1993 were received and are included as Appendix C.3. Based on ENVIRON's review, the following chronology is presented:

1899 – Details cannot be discerned due to the scale of the map (1:62,500). However, the site appears to be located at the approximate border between land and bay mud. Property currently to the north and east of the subject property is depicted as bay mud, whereas property currently to the south and west of the subject property is depicted as land. The City of San Mateo is depicted just northwest of the subject property location, and a rail line is depicted just to the south and west. Seal Creek is present to the east of the site.

1947 and 1949 – The subject property location is shaded on the 1947 map and shown to be improved with several small buildings on the 1949 map. Both maps depict a racetrack to the southeast of the site, a rail line and then development to the west, residential development to the north, and Seal Creek to the east. The 1949 map also shows Bay Meadows Airport just across 19th Avenue to the south and San Mateo Airport across Highway 101 to the northeast.

1956 – No development is depicted on the site, other than a rail spur on the far western side extending from the adjacent property to the north. Delaware Street has been constructed in its current configuration adjacent to the east. Since the 1949 map, Highway 101 has been converted into a limited access freeway; the airport to the

south has been replaced with a residential neighborhood, school, and county fairground; the airport to the northeast (across Highway 101) has been replaced with a residential area; and the residential area to the northeast has expanded.

1968, 1973, and 1980 – The existing building is visible on the 1830 S. Delaware Street parcel, whereas no development is depicted on the 470 Concar Drive parcel (the rail spur observed on the 1956 map no longer extends southward onto the site). Concar Drive, Highway 92, and the Highway 92 on/off ramps appear in their current configuration. Industrial or commercial development is now present just north, south, and east of the site, which was not depicted on the 1956 map and continues to increase on each successive map.

1993 – The site and immediate vicinity is shaded as an urbanized area, such that individual structures are not depicted.

5.2.7 Abstract of City Directories

EDR searched select national repositories of business directories. The 1830 S. Delaware address is not listed in City Directories dated 1976 through 1986; is listed as Telecenter Appliance in 1991 through 2006; and is also listed as Pogies Shop in 1991 and 1996. The 470 Concar Drive address is not listed in 1976; is listed as Denny's in City Directories dated 1981 through 1996; and is listed as Atco Enterprises, Concar Enterprises, and L.C. Smith Properties in 2001 and 2006. The only nearby property included in the City Directory abstract is 475 Concar Drive, which is identified as an office building in 1986 through 1996 and as Epiphany Inc in 2006. The EDR City Directory report is included as Appendix C.4.

5.2.8 Property Files Reviewed at Concar Enterprises, Inc.

ENVIRON reviewed property records within files at CEI. Relevant information obtained from these files is summarized below.

1830 S. Delaware Street

- The original building permit application from 1957 indicates the site was owned by Concar Ranch and Enterprises Inc., and that the 140-foot by 160-foot building was to be used as a bowling alley.
- Various documents from the late 1950s through the mid-1980s indicate the site was operated by 19th Avenue Bowl and later by ARC as a bowling alley.
- In 1982, the Gardenhouse Restaurant closed and Telecenter began leasing this space.

- Certain asbestos-containing acoustical ceiling tile identified during a 1988 asbestos survey was removed from the site later that year.
- In 2002 and 2003, Telecenter subleased space in its parking lot to The Car Store, Steve's Christmas Trees, and Redwood City Dodge Auto Sales.
- In 2004, CEI signed an access agreement with Equilon Enterprises LLC (dba Shell) for installation of monitoring wells associated with an investigation at the adjacent Shell service station (1790 S. Delaware Street). At that time, two monitoring wells were installed on the subject property (denoted as S-8 and S-9).

470 Concar Drive

- Denny's Inc. and The Bank of California entered into a lease agreement related to the building in 1978.
- Correspondence from May 2000 indicates that Denny's was intending to vacate the site by June 2000.
- CEI subleased 900 square feet of the building to Draeger's Supermarket Inc. in 2000 for storage of goods sold in its retail grocery stores.
- In 2001, CEI submitted a building permit application to remodel 1,002 square feet of the former Denny's interior to create CEI's office space.
- A fire department inspection in 2001 indicated that the rear of the building was being used by Patrick Flooring Inc as a shop, storage area, and wood varnishing area. This company was ordered to vacate the building immediately.
- Various improvements have been performed since 2001.

5.2.9 Prior Environmental Reports

ENVIRON was provided with several prior environmental reports related to the site, including Phase I/II Environmental Assessments for each parcel and past investigations related to adjacent off-site properties with identified contamination. A summary of information in these reports is provided below.

BAGG Phase I/II for 1830 S. Delaware Street dated June 30, 2000

The BAGG report indicates that the site was used for commercial or industrial operations, possibly associated with farming activities, prior to the construction of the existing building for use as a bowling alley in 1957. At the time of BAGG's report, the site was occupied by Telecenter for the current operations. The existing site occupant (Mr. Stern of Telecenter) indicated to BAGG his belief that the site may have contained a service station prior to the construction of the existing building, based on his conversations with the

builders involved in the construction of the building (rather than his own first-hand observation of a service station at the site). BAGG subsequently interviewed personnel from the company involved in the original building construction, who were not aware of a service station having been present at the site in the past.

To investigate soil and ground water conditions beneath the site, BAGG performed a Phase II investigation that involved installation of five borings to a depth of 16.5 feet bgs along the site periphery. Soil samples were collected at depths ranging from 1.5 to 16 feet bgs and were analyzed for total petroleum hydrocarbons (TPH) in the gasoline range (TPH-g); TPH in the diesel range (TPH-d); TPH in the motor oil range (TPH-mo); benzene, toluene, ethylbenzene and xylenes (BTEX); and methyl tert butyl ether (MTBE). These analytes were generally not detected in the soil samples above laboratory reporting limits, except for TPH-d (ranging between 1,000 and 2,700 ug/kg) and xylenes (ranging between 14 ug/kg and 18 ug/kg) at 5.5 to 6 feet bgs in three of the locations. These concentrations are well below San Francisco Bay Regional Water Quality Control Board (RWQCB) Environmental Screening Levels (ESLs) for commercial/industrial land use, and the constituents were not detected in deeper samples from the same borings. Ground water grab samples were collected from four of the borings (insufficient water was encountered in the remaining boring for collection of a sample), which were also analyzed for TPH-g, TPH-d, TPH-mo, BTEX, and MTBE. Petroleum-related constituents were identified in site ground water above their respective ESLs where ground water is a current or potential drinking water resource, including TPH-g (up to 1,200 ug/L, ESL is 100 ug/L), benzene (up to 110 ug/L, ESL is 1 ug/L), MTBE (up to 2,200 ug/L, ESL is 5 ug/L), and TPH-d (up to 110 ug/L, ESL is 100 ug/L). The MTBE concentration also exceeds the ESL for ground water that is not a current or potential drinking water resource (ESL is 1,800 ug/L). The BTEX concentrations do not exceed the ESLs for evaluation of potential vapor intrusion concerns in residential or commercial/industrial land use scenarios; these standards have not been established for the other constituents. Concentrations of gasoline-related constituents (TPH-g, BTEX, and MTBE) were generally highest at the northern portion of the site, and diesel-related constituents were highest on the northern and western portions of the site.

BAGG concluded that the ground water contaminants had likely migrated onto the property from the adjacent Shell service station to the north, and that the "minor contaminants" present in soil would be expected to biodegrade and attenuate naturally over time.

BAGG Phase I/II for 470 Concar Drive dated November 7, 2000

The BAGG report indicates that the site was used for commercial or industrial operations, possibly associated with farming activities or other bulk operations involving a railroad spur, prior to the construction of the existing building for use as a Denny's Restaurant in the late 1970s. At the time of BAGG's report, the building was temporarily occupied by a flooring business that stored hardwood, penetrating wood floor finish, paint thinner (two-gallon containers), adhesive in flooring (five-gallon buckets), etc. Employees of this company indicated that the subject property had been used as an unpaved parking lot for employees of an asphalt plant and/or aggregate company to the north (in the location currently occupied by K-Mart) approximately 40 to 50 years earlier. In addition, BAGG reviewed records from the City of San Mateo that indicated a 1,000-gallon underground grease interceptor was historically present to the south of the building.

To investigate soil and ground water conditions beneath the site, BAGG performed a Phase II investigation that involved installation of three borings to a depth of 16.5 feet bgs near the western, southwestern, and northeastern site boundaries. During advancement of the boring on the western edge of the site, an unidentifiable strong odor was noted. Soil samples were collected at depths ranging from 3 to 11 feet bgs and were analyzed for TPH-g, TPH-d, TPH-mo, BTEX, and MTBE. These analytes were generally not detected in the soil samples above laboratory reporting limits, except for TPH-mo (detected at 450 mg/kg on the western end of the site and at 290 mg/kg on the southwestern edge of the site). These concentrations are well below the ESL for commercial/industrial land use, and TPH-mo was not detected in deeper samples from the same borings. Ground water grab samples were collected from each boring, which were also analyzed for TPH-g, TPH-d, TPH-mo, BTEX, and MTBE. Petroleum hydrocarbon impacts were identified in site ground water above applicable ESLs where ground water is a current or potential drinking water resource, including TPH-g (up to 250 ug/L), benzene (up to 2.5 ug/L), MTBE (up to 13 ug/L), TPH-d (up to 910 ug/L), and TPH-mo (up to 1,100 ug/L, ESL is 100 ug/L). These concentrations do not exceed ESLs for ground water that is not a current or potential drinking water resource or ESLs for evaluation of potential vapor intrusion concerns in residential or commercial/industrial land use scenarios (developed for BTEX only). Gasoline-related constituents were generally highest on the northeastern corner of the site, whereas diesel- and motor oil-related constituents were generally higher on the southern and western portions of the site.

BAGG speculated that the motor oil-related contamination identified in soil and ground water may have resulted from historical industrial/commercial operations at the site, as BAGG believed the contamination was unlikely to have been caused by off-site sources. In contrast, BAGG believed that the gasoline-related contamination had likely

migrated onto the site from off-site sources to the south (e.g., the BP and Arco stations on the southeastern and southwestern corners of 19th Avenue and Delaware Street). BAGG did not believe that the identified contamination was significant enough to warrant further investigation or delineation. However, BAGG recommended further exploration on the western portion of the site prior to excavation activities in this area, in order to further define the unidentified odor noted in this area during drilling.

Documents Related to Adjacent Shell Service Station (1790 S. Delaware Street)

As described in Section 5.1 above, a gasoline release at the adjacent Shell service station resulted in contamination to ground water in the site vicinity. Under the oversight of the RWQCB, Shell's consultant (Cambria) is performing annual monitoring of wells located on the Shell property, along with one well within Delaware Street and two wells on the 1830 S. Delaware Street parcel (well S-8 on the northeastern corner and well S-9 on the northwestern corner of the parcel). According to a ground water monitoring report from the first quarter of 2007, ground water in the site vicinity generally flows in a southerly direction from the Shell service station towards the subject property. The monitoring report indicates that wells S-8 and S-9 were sampled quarterly between July 2004 and January 2006 and were sampled again in January 2007. During these sampling events, wells S-8 and S-9 contained elevated petroleum-related constituents above their ESLs where ground water is a current or potential drinking water resource, including TPH-g (up to 550 ug/L in S-8 and 260 ug/L in S-9), benzene (up to 93 ug/L in S-8), and MTBE (up to 1,700 ug/L in S-8). None of these constituents exceeded ESLs for ground water that is not a current or potential drinking water resource. In addition, ground water sampling from S-8 identified 59 ug/L of di-isopropyl ether (DIPE), 2.5 ug/L of tertiary butyl methyl ether (TAME), and 1,300 ug/L of tertiary butyl alcohol (TBA) and from S-9 identified TBA as high as 25 ug/L (ESLs not established for these constituents). Considerably higher contaminant levels have been identified on the upgradient Shell property.

In addition to the ground water monitoring report described above, ENVIRON was provided with a UST Removal Report prepared by CRA related to the excavation of a 550-gallon waste oil UST at the Shell property in June 2007. During the UST removal, soil samples collected from two locations in the excavation sidewalls did not contain analyzed constituents above their respective ESLs for shallow soil in residential areas where ground water is not a current or potential drinking water source (the regulatory screening level used in the report for comparison), except dimethyl phthalate (detected at up to 1.8 mg/kg, residential ESL is 0.035 mg/kg). A grab water sample collected from the excavation pit was not found to contain dimethyl phthalate above the laboratory reporting limit, although several constituents were identified in the grab water sample above the ESLs in place at

the time for ground water which is not a current or potential drinking water source, including TPH-d (up to 830 ug/L, ESL was 640 ug/L), lead (up to 14.0 ug/L, ESL was 2.5 ug/L), and nickel (up to 21.4 ug/L, ESL was 8.2 ug/L). The CRA report did not recommend additional activities associated with the lead and nickel exceedances, given that the ESLs were based on aquatic habitat protection and there were no completed exposure pathways from the site to an aquatic habitat (the lead and nickel concentrations in the grab water sample were below the California primary drinking water standard). To delineate the TPH-d impacts in ground water, CRA sampled a nearby ground water well to the southeast of the former UST, which did not contain TPH-d above the applicable ESL. Based on these results, CRA did not recommend further investigation of the waste oil tank.

CRA also submitted to the County Health Services Agency a request for case closure (original Case Closure Summary submitted in May 2006 and addendum submitted in June 2007). Although the closure summary identified residual contaminants in soil and ground water above potentially applicable cleanup standards, CRA argued that the contaminant sources had been removed, resulting contamination had been adequately characterized, contaminant levels were decreasing with time and were no longer migrating off-site, and the remaining contamination did not represent a significant risk to human health or the environment. It does not appear that the County has granted the case closure request to date.

Documents Related to Adjacent Former Exxon Service Station (1801 S. Delaware Street)
As described in Section 5.1 above, a gasoline release at the adjacent former Exxon service station resulted in soil and ground water contamination. Primary constituents of concern include TPH-g, BTEX, MTBE, TBA, cadmium, chromium, nickel, lead, and zinc. Exxon's consultant (ERI) is performing semiannual ground water monitoring of wells and piezometers on and immediately adjacent to the Exxon site, which suggest that ground water flow direction is highly variable and seasonally dependent. Based on the most recent ground water monitoring data from the third quarter of 2007, constituents above their respective ESLs remain on-site, including benzene (up to 65 ug/L), MTBE (up to 14,000 ug/L), and TPH-g (14,000 ug/L). However, wells located along the western site boundary (between the Exxon facility and the subject property) do not generally indicate contamination above applicable ESLs. ERI submitted to Exxon a Remedial Action Work Plan in April 2007, which proposed excavation of soil containing residual fuel hydrocarbons and metals (approximately 1,000 cubic yards total) as well as replacement of a ground water monitoring well. Although this work was scheduled for completion in August and September 2007, it was apparently delayed due to access issues. It is unknown whether these remedial activities have been performed to date.

Documents Related to Adjacent Arco Service Station (1950 S. Delaware Street) and BP (404 East 19th Street)

As described in Section 5.1 above, motor vehicle fuel releases were identified at the Arco service station adjacent to the south (across Highway 92) and at the former BP station adjacent to the southeast (across Highway 92 and Delaware Street). ENVIRON reviewed the most recent publicly available ground water monitoring report (third quarter 2007) that collectively covers these sites. Based on this report, ground water monitoring is performed quarterly at the Arco site and annually at the BP site. Ground water monitoring indicates a variable but generally eastward ground water flow direction. The third quarter 2007 ground water monitoring data identified MTBE up to 28 ug/L and other analyzed constituents generally below laboratory reporting limits (except for TBA up to 40 ug/L, DIPE up to 12 ug/L, and 1,2-dichloroethane [1,2-DCA] up to 7.6 ug/L). The highest concentrations of MTBE and TBA were generally identified downgradient (i.e., east and southeast) of the Arco facility, whereas the DIPE and 1,2-DCA were highest on the northern end of the site. The monitoring report suggested that Arco's consultant was intending to submit a case closure summary to the County within the next quarter. It is unknown whether this summary was subsequently submitted in the fourth quarter of 2007.

5.2.10 Historical Summary

Based on ENVIRON's review of the historical information sources described above, the subject property appears to be have been part of a larger property used by Leslie Salt for salt production activities at least as early as 1943. In the 1950s, the property contained several buildings used for automotive repair, truck repair, tire servicing, welding, storage, and office activities, apparently associated with a nearby asphalt plant. At that time, an oil house was also present on the subject property or in the current location of the Highway 92 on/off ramps that bisect the site.

The 1830 S. Delaware Street building was constructed in 1957 for use as a bowling alley and later underwent several expansions and renovations. The current site occupant (Telecenter) initiated electronics and appliance sales and warehousing operations in a portion of the building in the early 1980s, and expanded to the entire building several years later. Although the existing building occupant believed that a service station may have been located on this parcel prior to the construction of the existing building, the former presence of a service station could not be confirmed by the historical sources reviewed by ENVIRON.

The 470 Concar Drive building was constructed in 1978 for use as a Denny's Restaurant. Denny's vacated the site in 1999, at which time the front portion of the building was converted into office space for CEI. Since that time, portions of the building have been used by other

entities, including Patrick Flooring Inc. (a wood flooring company), Atco Enterprises (office activities), and Draegers (surplus grocery storage).

The area immediately surrounding the facility was used for industrial operations by the early 1900s. Commercial activities have been performed in the vicinity generally since the 1960s.

6.0 SITE RECONNAISSANCE

6.1 Methodology and Limiting Conditions

Wendy Seider of ENVIRON conducted a visit to the site on February 22, 2008. During the site visit, observations of both the interior of the buildings and exterior portions of the site were made to evaluate if any RECs, as defined in Chapter 2, are present. ENVIRON did not observe the roof of the buildings.

6.2 General Site Setting and Observations

ENVIRON made observations concerning all of the interior and exterior issues specified in Sections 9.4.2 through 9.4.4 of the ASTM E1527-05 Standard. The presence or absence of each issue of environmental interest or concern is noted in Table 2. Only those areas of environmental interest or concern that were observed to be present at the property are discussed further in the text below.

TABLE 2
Summary of Site Reconnaissance Observations[1]

Issue[2]	ASTM Section	Observation
Interior and Exterior Issues		
Current use(s) of the property	9.4.2.1	See Section 3.3
Past use(s) of the property	9.4.2.2	See Section 5.2
Hazardous substances and petroleum products used, treated, stored, disposed of, or generated on the property in connection with identified present or past uses	9.4.2.3	**Present (see Section 6.2.1)**
Storage tanks Underground storage tanks (fill ports, vent pipes, manholes) Aboveground storage tanks	9.4.2.4	 Absent Absent
Odors (strong, pungent or noxious)	9.4.2.5	Absent
Pools of liquid, standing surface water or sumps	9.4.2.6	Absent
Drums of hazardous substances or petroleum products (five-gallon, 55-gallon or totes)	9.4.2.7	Absent
Hazardous substance and petroleum product containers (not necessarily in connection with identified uses)	9.4.2.8	**Present (see Section 6.2.1)**
Unidentified substance containers suspected of containing hazardous substances or petroleum products	9.4.2.9	Absent
Polychlorinated biphenyls (PCBs) Electrical equipment on-site (e.g., transformers, capacitors)[3] Electrical equipment known or likely to contain PCBs Hydraulic equipment on-site (e.g., elevators, truck dock lifts) Hydraulic equipment known or likely to contain PCBs	9.4.2.10	**(see Section 6.2.2)** **Present** **Potentially Present** Absent Absent

TABLE 2
Summary of Site Reconnaissance Observations[1]

Issue[2]	ASTM Section	Observation
Interior Issues		
Heating/cooling systems	9.4.3.1	**Present (see Section 6.2.3)**
Stains or corrosion on interior floors, walls or ceilings (except for staining from water)	9.4.3.2	Absent
Floor drains and interior sumps	9.4.3.3	**Present (see Section 6.2.4)**
Exterior Issues		
Pits, ponds or lagoons on property or adjacent sites	9.4.4.1	Absent
Stained soil or pavement	9.4.4.2	Absent
Stressed vegetation (from other than insufficient water)	9.4.4.3	Absent
On-site solid waste disposal; areas apparently filled or graded by non-natural causes; or mounds or depressions suggesting solid waste disposal	9.4.4.4	**Present (see Section 6.2.5)**
Wastewater or other liquid (including storm water) or any discharge into a drain, ditch, underground injection system or stream on or adjacent to the property	9.4.4.5	**Present (see Section 6.2.6)**
Wells (including dry wells, irrigation wells, injection wells, abandoned wells, or other wells)	9.4.4.6	**Potentially Present (see Section 6.2.7)**
Septic systems or cesspools	9.4.4.7	Absent

Notes:
1) Observations noted in Table 1 and discussed further below are based on information obtained during the site visit and from a review of the sources summarized in Section 2.2.
2) See the ASTM Standard for a detailed description of the issues included in each referenced ASTM section.
3) Per the ASTM Standard, fluorescent light ballasts likely to contain PCBs do not need to be noted.

6.2.1 Hazardous Substances and Petroleum Products

At the time of the site visit, ENVIRON observed janitorial cleaning supplies stored on shelves within the women's restroom at 470 Concar Drive. These cleaning supplies consisted of retail-sized aerosols, cleaners, disinfectants, etc. No chemicals were observed by ENVIRON at 1830 S. Delaware Street.

6.2.2 Polychlorinated Biphenyls (PCBs)

Facility personnel were not aware of PCB-containing equipment at the facility. ENVIRON observed one pad-mounted transformer outside the southeastern side of the 470 Concar Drive building. The transformer did not appear to be labeled with respect to its PCB content. Because the property was developed before PCBs were phased out of use in 1979, it is possible that the transformer contains PCBs. The transformer appeared to be in good condition, and no staining indicative of a potential release was observed in the vicinity of the transformer. Facility personnel indicated that the transformer is utility-owned.

6.2.3 Heating/Cooling Systems

According to facility personnel, equipment associated with the buildings' heating, ventilation, and air conditioning (HVAC) systems are located on the roof. Facility personnel were uncertain of the type of refrigerant present in air conditioning units. No boilers are located on-site.

6.2.4 Floor Drains

ENVIRON observed floor drains within restroom areas and in the former Denny's kitchen area within the 470 Concar Drive building. Based on information in the BAGG Phase I/II for 470 Concar Drive, the kitchen drains may have discharged to a below-grade grease trap during operation of the restaurant.

6.2.5 Filled Area

According to Mr. Atkinson, fill material was brought on-site during construction of the adjacent highway in the 1950s or 1960s. Mr. Atkinson was not aware of the specific source of the fill material.

6.2.6 Wastewater

Sanitary wastewater is discharged to the municipal sewer system. Storm water generally runs via sheet flow into storm drains located on-site and in the adjacent streets.

6.2.7 Monitoring Wells

As described in Section 5.2.9, two monitoring wells were installed on the 1830 S. Delaware Street parcel in 2004 associated with contamination at the adjacent Shell service station. These wells are located on the northeastern corner (well S-8) and northwestern corner (well S-9) of the parcel. At the time of the site reconnaissance, ENVIRON observed these two monitoring wells and two additional apparent monitoring wells on the 1830 S. Delaware Street parcel. In addition, two piezometers were observed on the 470 Concar Drive parcel.

7.0 INTERVIEWS

7.1 Interviews with Present Owner, Site Manager and Occupants

During the site visit, ENVIRON met with and interviewed Jeff Atkinson, owner of CEI, which has leased and occupied the building at 470 Concar Drive since approximately 1999. Mr. Atkinson is also a partner in the family trusts that own the entire subject property (1830 South Delaware, L.P.; Concar 1830 SD Property, LLC; and Smith 470 C Property, LLC), and he has generally been involved with the subject property since 1991. In addition, ENIVRON briefly interviewed Richard Stern, owner of Telecenter, which occupies the 1830 S. Delaware Street parcel.

Most notably, the information provided to ENVIRON by the individuals interviewed included:

- An overview of the site setting and history.
- Electric, natural gas, water and sewer utility companies for the property.
- An overview of facility operations, including both current and known past practices at the site.
- Information regarding the presence or absence of hazardous materials and/or fuels used at the site.
- Information regarding the presence or absence of USTs and ASTs on-site.
- Information regarding past releases and subsurface investigations performed on-site.

Information received from interviews with facility personnel is discussed in applicable sections of this report.

7.2 Interviews with Past Owner and Occupants

No past owners or occupants were interviewed as part of this assessment, as contact information for past owners/occupants was not provided to ENVIRON. Information obtained through interviews with the current site occupant as well as from a review of historical reference sources identified several prior site operators.

7.3 Interviews with State and Local Government Officials

ENVIRON obtained information via telephone interviews, web-based resources and/or local agency visits relating to the history and possible RECs associated with the property from the San Mateo County Assessors Office and the City of San Mateo Building Department. Information received from these government offices is discussed in applicable sections of this report.

Information requests were also made to the City of San Mateo Fire Department and the San Mateo County Health Department, Environmental Health Division, which reported that they did not have any environmental-related records related to the site.

8.0 PHASE II ENVIRONMENTAL SITE INVESTIGATION

Based on ENVIRON's findings during completion of the Phase I described herein, a Phase II work plan was prepared in general accordance with ASTM International's *Standard Guide for Environmental Site Assessments: Phase II Environmental Site Assessment (ASTM 1903-97)*. The objective of the field sampling program was to conduct a screening-level assessment of the subsurface environmental condition of the property and identify any significant issues that could potentially impact the future use of the property or the construction of proposed commercial office space.

8.1 General Overview

ENVIRON developed and implemented a Field Sampling Program whereby samples of soil, ground water, and soil gas from the subject property were collected and analyzed during an initial field mobilization. A second field mobilization, which included soil and ground water sampling at eight additional locations at the 470 Concar Drive address, was conducted based on the analytical results of the first field mobilization. A detailed description of ENVIRON's field sampling program is provided in the following sections.

It should be noted that, in any field investigation, there is inherent uncertainty. This field sampling program was designed specifically to identify contamination associated with potential historical use of petroleum products and/or solvents on the site and in the site vicinity. The presence of contamination in areas outside of the locations specifically sampled or associated with contaminants not analyzed in this investigation cannot be ruled out. In addition, no off-site sample collection was included as a part of this limited Phase II investigation.

8.2 Pre-Field Activities

Prior to field mobilization, ENVIRON prepared a site-specific Health and Safety Plan (HASP) in order to communicate safety standards and procedures for the duration of the project. As required in San Mateo County, prior to the first field mobilization, ENVIRON obtained two environmental borehole drilling permits (one per parcel) from the San Mateo County Environmental Health Department (SMCEHD). Prior to the second field mobilization, an additional borehole drilling permit was obtained from the SMCEHD for the eight additional boreholes at the 470 Concar Drive address. In accordance with state law, the property was marked in white paint and a one-call dig ticket was submitted to Underground Service Alert (USA) at least 48 hours in advance, providing information on the work location to local utility companies. The one-call dig ticket was extended prior to the second field mobilization. In addition, a private utility locator, Subdynamic Locating Services (Subdynamic), was contracted to individually clear all drilling locations for subsurface utilities using geophysical locating

techniques prior to the first field mobilization. Due to magnetic interference reported by Subdynamic during the routine magnetometer survey for underground utilities at 470 Concar Drive and in the northern parking lot area of 1830 South Delaware Street, Subdynamic was unable to clear a number of drilling locations.

8.3 Site Geology

The subsurface geology of the site was characterized by ENVIRON using lithologic logs generated at three borings at 1830 S. Delaware Street and twelve borings at 470 Concar Drive (as described below). In general, approximately 2 inches of asphalt were present at the surface, followed by 2 to 4 inches of aggregate base. Fill soils (3 to 5 feet) were present at all boring locations, which generally consisted of heterogeneous brown sandy clays with gravel, with occasional brick and wood fragments. At most borings, the fill materials were underlain by approximately 2 feet of younger Bay Mud, consisting of black organic fat clays with intervals of peat material, which was generally moist to wet and exhibited strong odors of decay and hydrogen sulfide (H_2S). Below the younger Bay Mud materials, at depths of approximately 6 to 8 feet, were alluvial materials consisting of stiff to very stiff dark grayish to reddish brown sandy and silty lean clays, with occasional gravel lenses and iron oxide staining. These materials were observed to be damp to moist at their shallower depths, and ground water was generally encountered at depths of 9 to 10 feet or deeper within coarser-grained alluvial materials. Boring logs generated from ENVIRON's field activities are presented in Appendix I.

8.4 Soil and Ground Water Sampling

ENVIRON's scope of work included advancement of seven soil borings (SB-1 through SB-7) throughout the site for collection of soil and ground water samples during the first mobilization, and advancement of an additional eight soil borings (SB-8 through SB-15) at the 470 Concar Drive address during the second field mobilization (Figure 3). The sampling locations were selected to augment data collected during prior soil and ground water sampling along the periphery of the site. SB-1 through SB-3 were located on the north, west, and south sides of the building at 1830 S. Delaware Street, while SB-4 through SB-7 (first field mobilization) and SB-8 through SB-15 (second field mobilization) were distributed around the property at 470 Concar Drive.

Activities related to soil and ground water sampling were performed at the property during the first field mobilization on April 1 through April 3, 2008 by ENVIRON. Due to magnetic interference that prevented utility clearance, RSI Drilling, Inc. (RSI) was retained to hand auger five soil boring locations (SB-1, SB-4 through SB-7) to a depth of five feet below ground surface (bgs) on April 1. Subsequently, direct-push technology (DPT) drilling (to complete the hand augered boreholes and to advance SB-2 and SB-3) and ground water sampling services were provided by TEG Environmental Services, Inc (TEG) on April 2 and 3.

Activities related to soil and ground water sampling were performed at the property during the second field mobilization on April 29 and 30, 2008 by ENVIRON. WDC Exploration and Wells, Inc.

(WDC) was retained to hand auger eight additional boring locations (SB-8 through SB-15) to a depth of five feet bgs on April 29. Subsequently, WDC used DPT drilling at the eight locations to collect soil samples and advance each boring to 15 feet bgs. In order to allow for sufficient sampling volume to accumulate, and to allow ground water elevations to stabilize overnight, ground water sampling services were provided by WDC on April 30.

In an attempt to calculate a site-specific ground water flow direction, the eight ground water sampling locations from the second mobilization were surveyed for horizontal coordinates and vertical elevation by Kister, Savio, and Rei, Inc. (KSR) on April 30. Coordinates were based on the California Coordinate System, Zone 3 (CCS83), and vertical elevations were based on the North American Vertical Datum of 1988 (NAVD 88).

8.4.1 Soil Sampling – First Field Mobilization

Following hand auger utility clearance at five of the seven locations, soil borings were advanced during the first mobilization using an AMS PowerProbe 9635 DPT drill rig. The remaining two boring locations (SB-2 and SB-3), having been adequately cleared for underground utilities by Subdynamic, were advanced using DPT only. During the hand augering activities, soil samples were generally collected from the soil boring locations at intervals between 1 to 2 feet bgs and were retained until the soil borings were completed using DPT drilling, in order to consider the entire depth range of each boring before selection of a vertical sample interval. The sample interval from each boring that exhibited the greatest evidence of contamination based on field screening (i.e. visual, olfactory, or photoionization detector [PID] reading) was selected for laboratory analysis. In the absence of such evidence, the shallow sample collected between 1 to 2 feet bgs was submitted in order to characterize site fill materials.

At locations SB-1, SB-2, SB-4, and SB-5, no evidence of contamination was observed during field screening. Therefore, samples of site fill materials collected from intervals of 1.5 feet to 2.5 feet bgs were selected for laboratory analysis to characterize the fill materials.

At locations SB-3, SB-6, and SB-7, evidence of potential contamination was observed during field screening (black tar-like materials and hydrocarbon odors) at deeper intervals (between 5.0 and 6.5 feet bgs) in the native organic clay materials, samples of which were collected for laboratory analysis. These samples did not produce PID detections of volatile organic compounds (VOCs) during field screening.

Upon verbal approval from the Client, soil samples were also collected and submitted for laboratory analysis from locations SB-1 and SB-4 at intervals of 5.0 to 5.5 feet bgs and 3.0 to 3.5 feet bgs, respectively. These samples were collected to characterize areas of the underlying organic clay and peat layer that exhibited organic-like odors. While these samples did not exhibit visual or olfactory evidence of potential contamination similar to observations at SB-3, SB-6, and SB-7 (e.g., black tar-like material and hydrocarbon odors), field screening of these

samples indicated VOCs (up to 1,090 parts per million [ppm] at SB-1) and H_2S gas (up to 240 ppm at SB-1).

8.4.2 Soil Sampling – Second Field Mobilization

Following hand auger utility clearance at the eight additional boring locations at the 470 Concar Drive property, soil borings were advanced during the second mobilization using a Geoprobe 7700 DPT drill rig. The sample interval from each boring that exhibited the greatest evidence of contamination based on field screening (i.e. visual, olfactory, or PID reading) was selected for laboratory analysis. In the absence of such evidence, a sample collected from just above the Bay Mud deposits was submitted in order to characterize soils located below site fill materials.

At locations SB-12, SB-14, and SB-15, no evidence of contamination was observed during field screening. Therefore, samples from just above the Bay Mud deposits from depths of 4.0 feet, 7.0 feet, and 5.5 feet bgs, respectively, were submitted for laboratory analysis to characterize soils located below site fill materials.

At locations SB-8 through SB-11 and SB-13, evidence of potential contamination, including black tar-like materials and hydrocarbon odors, was observed during field screening, and samples of soils from within the potentially impacted intervals ranging from 2.5 feet to 6.0 feet bgs were selected for laboratory analysis. These samples did not produce PID detections of VOCs during field screening.

8.4.3 Ground Water Sampling – First Field Mobilization

During the first field mobilization, first indications of ground water (e.g. moist or wet soil) were generally noted at depths of approximately 3 to 5 feet bgs; however, sufficient recharge for sample collection was not encountered until borings were extended into what appears to be the primary shallow ground water-bearing zone, which was observed to begin at depths of approximately 9 to 12 feet bgs. Depending on the depth of first encountered ground water, the borings were advanced to depths ranging from 11 feet to 18 feet bgs. In order to collect ground water grab samples, temporary PVC well casings were inserted into the soil borings, each with a 5-foot screened interval at the bottom of the casing. Ground water samples were collected using a peristaltic pump with dedicated disposable polyethylene tubing.

Due to the slow recovery rate of ground water in most borings, the temporary well casings in SB-1, SB-2, SB-3, SB-4, SB-6, and SB-7 were left in the borings overnight to allow for sufficient ground water recharge for sample collection (a faster recovery rate in SB-5 enabled sample collection without overnight recharge at that location). Per SMCEHD guidelines, the tops of the well casings were sealed with silicone tape and the borings were sealed around the well casings with hydrated bentonite granules in order to prevent surface water (in the event of rain) or other foreign matter from entering the subsurface. Ultimately, ground water recharge

was insufficient for sample collection from borings SB-1 and SB-4, but samples were collected from the other five borings.

8.4.4 Ground Water Sampling – Second Field Mobilization

Depths to shallow ground water during the second field investigation were similar to those noted during the first field mobilization, and all borings were advanced to 15 feet bgs. In order to collect ground water grab samples, temporary PVC well casings were inserted into the soil borings, each with a 10-foot screened interval at the bottom of the casing.

Due to the slow recovery rate of ground water in most borings, the temporary well casings in all eight borings were left in the borings overnight to allow for sufficient ground water recharge for sample collection and to allow ground water elevations to stabilize in an attempt to calculate an approximate ground water flow direction. Per SMCEHD guidelines, the tops of the well casings were sealed with PVC slip caps, and the borings were sealed using metal plates and hydrated bentonite granules. After recharging overnight, sufficient volume was available for sample collection at all eight boring locations.

8.4.5 Surveying of Ground Water Sampling Locations – Second Field Mobilization

Prior to collecting ground water samples during the second field mobilization, the horizontal coordinates and vertical elevations of the temporary PVC well casings were surveyed by KSR. Horizontal coordinates were based on CCS83, and vertical elevations were based on NAVD 88. Surveying was conducted in an attempt to correlate the static ground water elevations at the eight ground water sampling locations to an approximate ground water flow direction. However, due to variations in the static ground water elevations across the site, a site-specific ground water flow direction could not be clearly determined from these measurements.

8.4.6 Laboratory Analyses

Soil and ground water samples collected during both the first and second field mobilizations were stored on ice in an insulated container prior to delivery to the analytical laboratory (McCampbell Analytical, Inc.). Soil and ground water samples collected during the first field mobilization were analyzed for total petroleum hydrocarbons in the gasoline, diesel, and motor oil ranges (TPH-g, TPH-d, and TPH-mo), California Assessment Manual (CAM) 17 metals, VOCs, and polycyclic aromatic hydrocarbons (PAHs). Based on analytical results of the first field mobilization, soil and ground water samples collected during the second field mobilization were analyzed for TPH-g, TPH-d, TPH-mo, and VOCs.

8.4.7 Quality Assurance/Quality Control Sampling

Several quality assurance/quality control (QA/QC) samples were collected during the soil and ground water sampling activities. In order to evaluate potential bias introduced by the analytical laboratory, a field duplicate ground water sample was collected from SB-5 and submitted to the laboratory as SB5D-GW during the first field mobilization. A field duplicate ground water sample was collected from SB-8 and submitted to the laboratory as SB8D-GW during the second field mobilization. Potential bias introduced by decontamination of drilling equipment was evaluated through collection of an equipment blank following both the first and second field mobilizations, by pouring deionized water through the decontaminated drill tooling into sample containers. Trip blank samples accompanied all soil and ground water samples during storage and transport to the analytical laboratory during both the first and second field mobilizations, in order to evaluate potential bias introduced to VOC samples during storage and transport.

8.5 Soil Gas Sampling

ENVIRON's scope of work for the first field mobilization included advancement of seventeen soil gas borings (SG-1 through SG-17) in locations distributed throughout the site (Figure 4). Borings SG-1 through SG-11 were distributed across the 1830 South Delaware Street address, and SG-12 through SG-17 were distributed across the 470 Concar Drive address. Soil gas sampling locations were biased towards areas of known or suspected contamination and areas proposed to be covered by buildings under the site redevelopment plans provided to ENVIRON. Soil gas sampling was conducted in general conformance with the San Francisco Bay Regional Water Quality Control Board (RWQCB) and the California Department of Toxic Substances Control (DTSC) Advisory on Active Soil Gas Investigations dated January 28, 2003.

Activities related to soil gas sampling were performed at the property on April 1 and April 3-4, 2008 by ENVIRON. Due to magnetic interference that prevented utility clearance, RSI was retained on April 1 to hand auger ten soil gas locations (SG-1 through SG-4 and SG-12 through SG-17) to a depth of 5 feet bgs or to first encountered ground water (whichever occurred first). The remaining seven soil gas locations were successfully cleared using geophysical locating. The hand auger borings were evaluated for moisture content during their advancement, and an approximate 1-foot soil gas sampling depth interval was selected in each boring and filled with clean, dry sand. If ground water appeared to be collecting at the bottom of the hand augered borehole, bentonite granules were placed below the sand layer to prevent ground water from saturating the sand interval. From the sand interval up to the surface, the boreholes were backfilled using bentonite granules that were hydrated as they were emplaced, in order to prevent ambient air intrusion from the ground surface. At the ground surface, the borings were sealed with 2 to 3 inches of neat Portland cement grout.

Subsequently, TEG performed drilling of the pre-cleared soil gas locations and performed soil gas analytical services on April 3 and 4, 2008. Soil gas probes were advanced using an AMS PowerProbe 9635 direct-push drill rig to approximately 3 to 5 feet bgs and were allowed to equilibrate

for approximately 20 minutes. Soil gas samples in boring locations that had been advanced by hand auger were collected from the sand interval that had been placed in each boring to facilitate soil gas sampling. Following purging of the sample tubing, soil gas samples were collected directly from the sample tubing into a glass syringe, and immediately analyzed for VOCs by USEPA Method 8260B and methane by USEPA Method 8015M in an on-site mobile laboratory supplied by TEG. In addition, samples were also screened for H_2S using a MultiRAE™ gas meter calibrated for H_2S detection. Three soil gas sampling locations (SG-6, SG-9, and SG-17) were not able to be sampled due to very shallow ground water.

Two duplicate soil gas samples were collected for QA/QC purposes, and one purge volume test was conducted, which indicated that a single purge volume was appropriate for use across the site.

8.6 Sample Results Summary

The following sections discuss laboratory results, which are summarized in the attached tables. Results are not included if, for a given analyte, no detections above laboratory reporting limits were obtained in any of the samples submitted for analysis. Complete laboratory analytical reports are included as Appendix H. To provide context for the sampling results obtained, ENVIRON compared the results to applicable generic screening criteria generally used by regulatory authorities for the assessment of potential environmental concerns associated with contaminated media. A detailed description of the generic screening criteria used by ENVIRON is provided below.

Soil sample results, presented in Tables 3 and 4, were compared with the DTSC California Human Health Screening Levels (CHHSLs) for commercial/ industrial land use (where established), the RWQCB Environmental Screening Levels (ESLs) for shallow soils in commercial/industrial land use areas that are not current or potential drinking water sources (where established), and (in the case of one metal without an established CHHSL) the United States Environmental Protection Agency (USEPA) Region IX Preliminary Remediation Goals (PRGs) for direct contact with industrial soil. The CHHSLs are used as benchmark screening levels (in various environmental media) for the evaluation of potential human health concerns under a variety of land use scenarios, including residential and commercial development. If the underlying default assumptions are applicable, the presence of a chemical at concentrations below the corresponding CHHSL can be assumed to not pose a significant health risk under the applicable land use scenario under most circumstances. In situations where CHHSLs have not been developed for a particular chemical, sample results for metals are compared with the USEPA PRGs. Similar to CHHSLs, the intended use of PRGs and ESLs are as benchmark screening tools for the evaluation of contaminated sites. Similar to CHHSLs and PRGs, the ESLs consider potential future exposure pathways for site occupants. However, the ESLs also consider protection of ground water. Therefore, ESLs (where established) were used as the primary screening criteria for organic contaminants (VOCs, SVOCs, and petroleum hydrocarbons).

Metals in soil were also compared with Total Threshold Limit Concentrations (TTLCs) for hazardous waste characterization in California (potentially applicable if soil were disposed off-site

during construction activities), as well as naturally-occurring metals concentrations in soils reported in four literature sources (Elements in North American Soils, by Dragun & Chiasson, 1991; Background Concentrations of Trace and Major Elements in California Soils, by the Kearney Foundation, March 1996; Background Concentrations in Soils in Northern Santa Clara County California, by Scott, 1991; and Analysis of Background Distributions of Metals in Soil at the Lawrence Berkeley National Laboratory (LBNL), by LBNL, 2002).

Ground water results, presented in Tables 5 and 6, are compared with USEPA and California Maximum Contaminant Levels (MCLs) for drinking water and RWQCB ESLs where ground water is not a current or potential drinking water source. In addition, Tables 5 and 6 include the City of San Mateo's general limitations for discharges into the sanitary sewer system (potentially applicable if wastewater from construction dewatering activities were to be discharged to the sanitary sewer).

Soil gas results, presented in Table 7, are generally compared with CHHSLs and ESLs for commercial/industrial land use. As CHHSLs and ESLs have not been established for methane and H_2S, these results have been compared to 10% of their Lower Explosive Limits (LELs), per DTSC's Advisory on Methane Assessment and Common Remedies at School Sites dated June 16, 2005. In addition, Table 7 includes the Threshold Limit Values – Time-Weighted Average (TLV-TWA) (potentially applicable for construction workers exposed to soil vapors during site construction).

8.6.1 Soil Analytical Results

CAM 17 Metals by USEPA Methods 6010 and 7470

Various metals were detected in the soil samples collected from the property during the first field mobilization, as summarized in Table 3. With the exception of arsenic, detected metals concentrations from soil samples at the property were below their respective CHHSLs for commercial/industrial land use. Arsenic concentrations in the soil samples collected from the site ranged from 1.4 mg/kg to 11 mg/kg. Although these concentrations exceed the commercial/industrial CHSSL for arsenic (0.24 mg/kg), arsenic concentrations detected at the property fall within generally reported ranges for background concentrations in California soils. All metals were present well below their respective TTLC levels for hazardous waste classification in California. Soil samples collected during the second field mobilization were not analyzed for CAM 17 metals.

VOCs by USEPA Method SW8260B

As summarized in Table 4, several VOCs were detected above laboratory reporting limits in soil samples collected and analyzed during the first and second mobilizations, including acetone, 2-butanone, carbon disulfide, ethylbenzene, 2-hexanone, 4-isopropyl toluene, 4-methyl-2-pentanone, naphthalene, toluene, 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, and total

xylenes. None of the detected VOCs exceeded their respective ESLs for commercial/industrial land use, where established.

TPH-g, TPH-d, and TPH-mo by USEPA Method SW8015C

As summarized in Table 4, soil samples collected and analyzed during the first and second field mobilizations contained TPH-g (up to 39 mg/kg), TPH-d (up to 2,100 mg/kg), and TPH-mo (up to 2,700 mg/kg). Concentrations of TPH-g were below the ESL for commercial/ industrial land use of 450 mg/kg. In certain locations, concentrations of TPH-d and TPH-mo exceeded their respective ESLs for commercial/industrial land use of 150 mg/kg and 2,500 mg/kg, respectively.

Polycyclic Aromatic Hydrocarbons (PAHs) by USEPA Method SW8270C

As summarized in Table 4, three PAHs were detected above laboratory reporting limits in one soil sample collected during the first field mobilization (SB7-5.0), including 1-methylnaphthalene, 2-methylnaphthalene, and phenanthrene. None of the detected PAHs exceeded their respective ESLs for commercial/industrial land use, where established. Soil samples collected during the second field mobilization were not analyzed for PAHs.

8.6.2 Ground Water Analytical Results

Dissolved CAM 17 Metals by USEPA Methods 6010 and 7470

Various metals were detected in the ground water samples collected from the property during the first field mobilization (see Table 5). Although concentrations of arsenic, cadmium, cobalt, and nickel exceeded their respective primary MCLs for drinking water, these constituents were present well below ESLs where ground water is not a current or potential drinking water source. In addition, all metals were present below their respective City of San Mateo municipal sanitary sewer discharge limitations, where established. Ground water samples collected during the second field mobilization were not analyzed for dissolved CAM 17 metals.

VOCs by USEPA Method SW8260B

Several VOCs were detected in the ground water samples collected and analyzed during the first and second field mobilizations, including acetone, bromochloromethane, bromodichloromethane, 2-butanone, t-butyl alcohol, carbon disulfide, chloroform, 1,2-dichloroethane (1,2-DCA), methylene chloride, 4-methyl-2-pentanone, 2-hexanone, methyl tert-butyl ether (MTBE), and naphthalene (see Table 6). None of these constituents exceeded their respective ESLs for non-drinking water in commercial/industrial land use areas, with the exception of 1,2-DCA (detected up to 950 µg/L, compared to an ESL of 690 µg/L). Detected constituents in one sampling location exceeded of the City of San Mateo's municipal sanitary sewer discharge limitation for total priority organic toxic pollutants.

TPH-g, TPH-d, and TPH-mo by USEPA Method SW8015C

As summarized in Table 6, ground water samples collected during the first and second field mobilizations contained concentrations of TPH-g (up to 590 µg/L), TPH-d (up to 1,400 µg/L), and TPH-mo (up to 1,800 µg/L), below their ESLs for non-drinking water areas of 5,000 µg/L, 2,500 µg/L, and 2,500 µg/L, respectively. These concentrations are also below the City of San Mateo municipal sanitary sewer discharge limitations for TPH-g and TPH-d (each 10,000 µg/L).

Polycyclic Aromatic Hydrocarbons (PAHs) by USEPA Method SW8270C

One PAH, naphthalene, was detected in one ground water sampling location (sample SB5-GW and its duplicate) during the first mobilization (see Table 6). The concentration of naphthalene (up to 1.4 µg/L)2 was well below the ESL where ground water is not a current or potential drinking water source (210 µg/L). Ground water samples collected during the second field mobilization were not analyzed for PAHs.

8.6.3 Soil Gas Analytical Results

VOCs by USEPA Method SW8260B

Three VOCs, benzene, toluene, and tetrachloroethene (PCE), were detected above laboratory reporting limits in soil gas samples collected and analyzed for this investigation (see Table 7). Concentrations of benzene (up to 620 µg/m^3) exceeded the commercial/industrial CHHSL (122 µg/m^3) at four locations and the ESL (280 µg/m^3) at one location, all on the 1830 South Delaware Street property. Toluene and PCE were detected at concentrations that did not exceed the CHHSL or ESL for commercial/industrial land use.

Methane by USEPA Method SW8015M

As summarized in Table 7, methane was detected at seven locations above laboratory reporting limits in soil gas samples collected and analyzed for this investigation. Methane exceeded the value that corresponds to ten percent of its LEL (0.53%) and the TLV-TWA (0.1%) in two locations (SG-5 and SG-10), where methane concentrations were 1.1% and 29% by volume, respectively.

---

2 The naphthalene result of the SB-5 duplicate ground water sample was reported as 1.4 µg/L by the USEPA SW8270C analysis and as 0.95 µg/L by the USEPA 8260B analysis. The greater of the two results is reported herein.

Hydrogen Sulfide (H_2S) using MiniRAE™ Gas Meter

H_2S was detected in one soil gas sample collected for this investigation. The concentration did not exceed its TLV-TWA or 10% of its LEL value. It should be noted that this H_2S value was not collected using a USEPA standard laboratory method.

8.7 Discussion of Phase II Findings

ENVIRON performed a Phase II soil, soil gas, and ground water investigation at 1830 South Delaware Street and 470 Concar Drive in San Mateo, California in connection with the potential redevelopment of the site. The field work was conducted in two phases: initial site-wide soil, soil gas, and ground water sampling on April 1 to 3, and follow-up soil and ground water sampling focused on the 470 Concar Drive address on April 29 to 30. A summary of ENVIRON's findings is presented below.

Soil Sampling

Soil samples were collected from fifteen locations throughout the site at depths ranging from 1.5 to 7 feet bgs for analysis of TPH, VOCs, and (for those samples collected during the first field mobilization) CAM 17 metals and PAHs. Sample results were generally below applicable screening levels and/or typical naturally-occurring background concentrations, with the exception of TPH-d at three locations and TPH-mo at one location at the 470 Concar Drive address. The limited soil sampling performed by ENVIRON did not identify contaminants that would clearly necessitate disposal of excavated site soils as hazardous waste during potential site redevelopment activities, although additional sampling would be necessary to confirm that leachable chromium and lead concentrations do not exceed hazardous waste criteria.

Ground Water Sampling

Ground water samples were collected from thirteen locations throughout the site for analysis of TPH, VOCs, and (for those samples collected during the first field mobilization) dissolved CAM 17 metals and PAHs. With the exception of 1,2-dichloroethane (1,2-DCA), none of the analyzed parameters were identified above RWQCB ESLs applicable to commercial/industrial sites where ground water is not a current or potential drinking water source (where established). At several boring locations at 470 Concar Drive, particularly on the southern portion of the property, 1,2-DCA was identified above the commercial/industrial ESL (based on the vapor intrusion pathway). Although the source of the 1,2-DCA contamination is unknown, factors such as the apparent regional direction of ground water flow (to the northeast), the spatial distribution of the detections (highest on the southern property boundary with a decreasing trend to the northeast), the magnitude of the 1,2-DCA detections, and the absence of 1,2-DCA above reporting limits in soil samples collected from the site are consistent with the presence of an off-site source of the 1,2-DCA, possibly located to the south of the subject property. Based on the

data collected, ENVIRON does not believe that the identified 1,2-DCA is likely to be indicative of a significant on-site source. It should be noted that the subject property is located in close proximity to a number of off-site facilities with known or suspected releases to ground water and that maintenance operations appear to have been performed on the adjacent property to the south (as well as on the subject property) in the 1940s, as detailed in Chapter 5.0.

Design of future buildings at the site should consider potential vapor intrusion concerns associated with the presence of 1,2-DCA, as well as other constituents identified in soil gas, as discussed below. The ground water sampling data suggest that wastewater potentially generated during site construction through dewatering activities could likely be discharged to the municipal sanitary sewer, particularly if a treatment system is employed.

Soil Gas Sampling

During the first round of Phase II activities, soil gas samples were collected from fourteen locations throughout the site for analysis of VOCs, methane, and hydrogen sulfide. With the exception of benzene and methane, constituents were not identified above applicable screening levels for commercial/industrial sites. Benzene was identified above its screening level for the vapor intrusion pathway. The benzene has likely resulted (at least in part) from releases at off-site service stations in the immediate vicinity of the subject property. ENVIRON believes that the elevated methane concentrations may be associated with decomposition of organic matter in naturally-occurring soils beneath the on-site fill.

Design of future buildings at the site should consider potential vapor intrusion concerns associated with the presence of these constituents (as well as the 1,2-DCA described above). ENVIRON believes that (if necessary) properly designed and readily-available engineered controls (passive or active vapor barriers), as well as the planned underlying parking garage, are likely to provide sufficient mitigation measures to address the identified vapor intrusion concerns at the property.

Dear Mr. Mullaney:

The attached report summarizes our request for case closure for the San Mateo United States Post Office, located at 1630 South Delaware Street insane Mateo, California.

We refer you to the text of the report for details regarding this study. Thank you for choosing us to assist you. As always, please feel free to contact me directly at 415-644-3044 with any questions or concerns.

Very truly yours,

TRC

Charles Mettler, P.G.
Principal Geologist

SUMMARY CLOSURE REPORT

SAN MATEO USPS VMF
SAN MATEO, CALIFORNIA

1.0 INTRODUCTION

On behalf of the United States Postal Service, TRC submits this Closure Summary for the subject site, located at 1630 South Delaware Street in San Mateo, California (Site) (Figure 1). This Closure Summary report is based on the results of investigations, remedial actions, and monitoring conducted over the last 6.5 years which have been summarized in the Site Background below. The purpose of this report is to demonstrate that site no longer presents a risk to the environment. A Closure Summary Table is included in Appendix A.

2.0 SITE BACKGROUND

2.1 Site Description

The site is located at 1630 South Delaware Street in San Mateo, California (Figure 1) and is currently occupied by the USPS San Mateo VMF. A replacement 12,000-gallon double-walled fiberglass underground storage tanks (UST) for gasoline was installed in September 1989. In addition, a 500-gallon waste-oil UST located to the east of the gasoline tank was also removed, along with associated piping, and replaced with a 750-gallon double-walled fiberglass UST with double-walled piping (see Figure 2). Based on results of the tank removal activities, the San Mateo County Department of Environmental Management requested additional investigations at the site. Investigations included the installation of four groundwater monitoring wells and subsequent sampling.

Based on the results of the initial monitoring events and a groundwater flow direction to the southwest, two additional monitoring wells (MW-5 and MW-6) were installed in 1993, down-gradient of tank area. Groundwater monitoring was completed intermittently through the fourth quarter of 1996, at which time gasoline, BTEX compounds, and fuel oxygenates were not detected above the laboratory detection limit and a "*no further action*" request was submitted to the San Mateo County Environmental Health Department (SMCEHD) (Lowney, 1997). In 2001, reportedly all on-site monitoring wells were destroyed in accordance with SMCEHD requirements and "*no further action*" was granted by the SMCEHD in 2001 for the site.

In January 2005, the 12,000-gallon gasoline and the 750-gallon waste-oil tanks were removed. Upon removal, the tanks appeared to be in good condition. No holes, deteriorated areas, or other signs of leakage were observed. Minor green staining was observed on soil beneath the piping leading from the gasoline tank to the northern dispenser. Methyl tertiary butyl ether (MTBE) was detected above the Environmental Screening Level (ESL, San Francisco Bay Regional Water Quality Control Board, February 2005,) (up to 0.940 parts per million [ppm]) in soil samples collected from beneath the tank, dispensers, and piping. Tertiary butyl alcohol (TBA) (0.160 ppm) was detected above the ESL in the soil sample collected beneath the northern dispenser. Other petroleum hydrocarbons were not detected above ESLs in the soil from the gasoline tank excavation, or beneath the dispensers or piping.

Laboratory analyses of soil samples collected from the waste-oil tank excavation detected low concentrations (below ESLs) of diesel range petroleum hydrocarbons (up to 10 ppm) and total oil and grease (up to 190 ppm). LUFT (Leaking Underground Fuel Tank) metal concentrations were below ESLs and appeared typical of natural background concentrations (Lowney, 2005).

Based on the results of the tank removal activities, the SMCEHD reopened the case and required in their letter dated January 25, 2006, a subsurface investigation to evaluate soil and water quality in the vicinity of the former UST area.

This closure summary report focuses on the activities and investigative findings since the 2005 tank removal work completed at the site and the reopening of the site by the SMCEHD.

2.2 Site Geology and Hydrogeology

The subject property is situated at an elevation of approximately 8 feet above mean sea level (msl). Based on recent and previous drilling results, the site is underlain by young Holocene sedimentary deposits. Generally the upper 3- to 5-feet-below grade consist of artificial fill with gravelly brown greenish organic-rich clay (af, Artificial Fill, USGS, OFR 98-137) and local anthropogenic debris, such as brick fragments and fragments of apparent wooden boards, etc. The fill unit in turn is underlain by apparent Holocene alluvial and fluvial deposits (Qhaf) that at the site consists of a sedimentary sequence of fine-grained sedimentary deposits, including silty clays and fat clays, underlain by more permeable sandy units with occasional gravel below (see Geologic Cross Section, Figure. 3).

Groundwater is generally encountered at depths ranging between 3- to 12-feet-below grade, generally confined in the more permeable sandy and gravelly units. Regionally, groundwater flow is expected to be easterly to northeasterly toward the San Francisco Bay and local dewatering channels. Historic groundwater flow data obtained from the site indicates a general flow direction for the shallow groundwater ranging from west to east with a predominately south to southeasterly flow direction. Groundwater measurements obtained from monitoring wells completed during these investigations indicate a southeasterly flow direction for the shallow groundwater underneath the site. See Figure 4 for a recent (March 23, 2011) groundwater elevation contour map. A summary of groundwater elevations observed from September 2009 to March 2011 is presented in Table 1 below.

Table 1
Summary of Groundwater Elevations in MW-01, MW-02 and MW-03

Well Number	Date	Top of Casing Elevation * (feet msl)	Depth to Groundwater ** (feet)	Groundwater Elevation (feet msl)	Groundwater Flow Direction

MW-03	3/23/11	7.73	2.45	5.28	

2.3 Summary of Site Investigations

A list of investigative and monitoring reports regarding the current case are included in Section 9, and summarized below.

2.3.1 Previous UST Removal and Remedial Activity: 1988 to 2001

A 10,000-gallon tank containing unleaded gasoline was on-site until its removal in 1988. Tank tightness tests performed on the tank in 1986 indicated a potential leak. During the removal of the tank in January 1988, small holes were observed in the upper portion of the tank. Laboratory analysis of two soil samples collected from underneath the tank detected gasoline range hydrocarbons (TPHg) of 4.7 and 25 parts per million (ppm) respectively (Kaiser Engineers, 1988). In addition, 100,000 parts per billion (ppb) of TPHg was detected in ponded water collected from the tank excavation.

To further evaluate soil and groundwater quality in the tank vicinity, nine borings were completed, four of which were converted into groundwater monitoring wells. Initial groundwater samples collected in January and March 1989 did not detect TPHg, benzene, toluene, ethylbenzene and xylenes (BTEX) above the laboratory detection limits (Kaiser Engineers, 1989).

A replacement 12,000-gallon double-walled fiberglass tank to store gasoline was installed in September 1989. In addition, a 500-gallon waste-oil tank located to the east of the gasoline tank was also removed along with associated piping and replaced with a 750-gallon double-walled fiberglass tank and double-walled piping (see Figure 2).

Laboratory analyses of groundwater samples collected from on-site monitoring well MW-4 in September 1990, detected up to 20,000 ppb TPHg, and 6,400 ppb benzene. By April 1991, groundwater monitoring showed TPHg as non-detect; benzene was detected at 96 ppb (Brown and Caldwell Consultants).

Based on the results of the initial monitoring events and a predominant groundwater flow direction to the southwest, two additional monitoring wells (MW-5 and MW-6) were installed in 1993, down-gradient of the tank area. Groundwater monitoring was completed intermittently through the fourth quarter, 1996. During the fourth quarter 1996 sampling event, gasoline, BTEX compounds, and fuel oxygenates were not detected above the laboratory detection limit and a "*no further action*" request was submitted to the San Mateo County Environmental Health Department (SMCEHD) (Lowney, 1997).

In 1997, repair/retrofitting work was performed involving the gasoline and waste oil USTs. Prior to performing the UST repair work, the piping sump enclosures located on the top of each UST were not water tight and allowed groundwater to infiltrate into the sumps during high groundwater conditions. Due to the presence of water in the sumps, the liquid sensors present for leak detection purposes were not operational. Therefore, the purpose of the UST repair work was to retrofit the existing gasoline and waste oil USTs to prevent future infiltration of groundwater into the piping sumps and allow the leak detection system to operate properly. Since completion of the repair and retrofitting work, no leaks were detected.

In 2001, reportedly all on-site monitoring wells were destroyed in accordance with SMCEHD requirements and "*no further action*" was granted by the SMCEHD in 2001 for the site.

2.3.2 Current UST Removal and Remedial Activity: 2005 to Present

2.3.2.1 January 2005: Tank Removal

In January 2005, the 12,000-gallon gasoline and the 750-gallon waste-oil tanks were removed. Upon removal, the tanks appeared to be in good condition. No holes, deteriorated areas, or other signs of leakage were observed. Minor green staining was observed on soil beneath the piping leading from the gasoline tank to the northern dispenser. Methyl tertiary butyl ether (MTBE) was detected above the Environmental Screening Level (ESL) (up to 0.940 ppm) in soil samples collected from beneath the tank, dispensers and piping. T-butyl alcohol (TBA) (0.160 ppm) was detected in the soil sample collected

beneath the northern dispenser. Other petroleum hydrocarbons were not detected above ESLs in the soil from the gasoline tank excavation, or beneath the dispensers or piping.

Analysis of soil samples collected from the waste-oil tank excavation detected low concentrations (below ESLs) of diesel-range petroleum hydrocarbons (up to 10 ppm) and total oil and grease (up to 190 ppm). Leaking Underground Fuel Tank (LUFT) metal concentrations were below their respective ESLs and appeared typical of natural background concentrations. A summary of soil analytical results is presented below in Table 2.

A grab sample of ponded groundwater (GW-1) was collected from the gasoline tank pit. Analysis of the ponded water from the gasoline tank excavation detected TPH as gasoline (6,300 ppb) and MTBE (7,100 ppb) exceeding ESL and Maximum Contaminant Levels (MCLs) concentrations.

A grab sample of ponded groundwater (GW-2) was collected from the waste oil tank pit. Approximately 1,000 gallons of ponded water were pumped from the waste-oil tank excavation. Analysis of recharged, ponded water from the waste-oil tank excavation detected TPH as gasoline (TPHg), TPH as diesel (TPHd), and oil and grease exceeding ESL and MCL concentrations. BTEX compounds also were detected but did not exceed the MCLs or ESLs. Fuel oxygenates were not detected in the ponded water from the waste-oil tank excavation and LUFT metal concentrations were below ESLs and MCLs. A summary of ponded groundwater analytical results is presented below in Table 3.

During the tank removal activities in January 2005, two apparent groundwater monitoring wells, one located within each of the fuel tank pit and the used oil tank pit, were removed in accordance with SMCEDH permits and guidelines. Based on documents reviewed it appears that all six on-site groundwater monitoring wells (MW-1, through MW-6) were destroyed on May 25, 2001. It appears that the two wells located within the tank pit excavations and removed during the tank removal work may have been an integral part of the tank monitoring system and were possibly also used to monitor water levels within the tank pits.

Since petroleum hydrocarbons were not detected above ESLs in the excavated soil stockpiles, this material was used to backfill the UST excavations with the approval of the SMCEHD. Additional soil was imported, as needed.

2.3.2.2 2006: Initial Site Characterization

Based on the results of the tank removal activities, the SMCEHD required in their letter dated January 25, 2006, to further evaluate and characterize soil and water quality in the vicinity of the former UST area. A work plan was submitted to the SMCEHD, which was approved in their letter dated June 19, 2006. The scope of work included the completion of four borings (EB-1, EB-2, EB-3 and EB-4) to a depth of approximately 16 feet and the collection and analysis of soil and groundwater samples (See Figure 4). The work was completed on August 7, 2006. The results of this work indicated the presence of gasoline and MTBE impacted groundwater down-gradient of the former UST area (Table 4).

2.3.2.3 2009: Soil, Soil Vapor and Groundwater Investigation

The SMCEHD requested additional subsurface investigation at the site to further delineate impacts to groundwater and soil in their letter dated February 20, 2008. A work plan and work plan addendum were prepared and submitted to the SMCEHD and was approved in their letter dated March 4, 2009. The scope of work included the completion of ten borings to a depth of approximately 16 feet below grade and the collection and analysis of soil, soil vapor, and groundwater samples.

On August 31 through September 2, 2009, and under the supervision of Principal Geologist Charles Mettler, P.G., Staff Environmental Scientist Kier Bass directed a subsurface exploration program and logged ten borings (EB-01 through EB-07, MW-01, MW-02, and MW-03) to approximate depths of 16 feet. Exploratory borings EB-01, 02, and 03 were drilled in the approximate up-gradient direction of the former UST pit to evaluate background levels; boring MW-02 was drilled in the estimated cross-gradient

from the UST pit to evaluate lateral extent of the contaminant plume; borings EB-04 and EB-05 were located within the maintenance facility; and borings EB-06, EB-07 and MW-03 were advanced to the southwest of the building to collect soil vapor samples, in the estimated down-gradient direction as depicted on Figure 2. Soil samples were obtained from continuous core, 5-foot plastic liners. Groundwater was encountered at approximate depths of 4 to 8 feet. Soil sampling protocol and boring logs are presented in Appendix B. The initial sampling of the newly installed wells was completed on September 14, 2009. Laboratory analyses detected MTBE in groundwater from wells MW-01 (3.7 ppb) and MW-02 (70 ppb).

To evaluate groundwater quality at the site, groundwater grab samples were collected from each well and borings (EB-02, EB-05, EB-06, and EB-07). Shallow groundwater was not encountered in borings EB-1, EB-3, and EB-4 after drill completion to a depth of 16 feet. Laboratory analysis of groundwater grab samples collected from the monitoring wells and borings detected gasoline-range petroleum hydrocarbons of 240 ppb in boring EB-02 and MTBE was detected between 1.0 and 170 ppb with the highest concentration located in boring EB-02, which represents a significant decrease from the highest detected concentrations obtained during the 2006 investigation that ranged between 430 to 560 ppb for MTBE and up to 550 ppb for TPHg. No BTEX compounds were detected in the groundwater samples at or above laboratory reporting limits. See Analytical Results of Groundwater Samples Table 6.

Laboratory analysis of soil samples collected from the seven exploratory borings did not detect levels of TPHg, BTEX, or tertiary butyl alcohol (TBA). Minor concentrations of MTBE were detected in three borings ranging between 0.1 and 0.16 parts per million (ppm). The highest levels were detected in soil collected near the soil and groundwater interface in borings EB-02 and EB-03. The detected low concentration was also confirmed by the low organic vapor meter (OVM) readings monitored during drilling and sampling. Constituents were not detected at or above laboratory reporting limits in the more shallow samples. Based on the low concentrations detected, it appears that the significantly impacted soil was removed during the previous over-excavation of the UST pit area and that impacted groundwater did not significantly cross-contaminate soil within the groundwater/soil interface at a larger distance away from the tank source area. See Analytical Results of Soil Samples Table 7.

* Environmental Screening Level-Table A, SF Bay CRWQCB, May 2008.

EB-02 is located to the north of the former tank area and based on groundwater flow directions obtained during previous groundwater monitoring events (1998-2001) it appears to be up-gradient from the source area and cross-gradient based on current groundwater flow direction. The second highest MTBE concentration of 70 ppb was detected to the south (prevalent down-gradient) of the former tank area in groundwater monitoring well MW-2. The apparent up-gradient location of EB-02 with respect to the former tank-pit area and historic groundwater flow directions, suggest a possible preferential pathway (utility corridors) or a potential second source to the north that might be responsible and explain the apparent impact up-gradient from the former tank-pit.

Based on the results of these investigations, the lateral extent of MTBE impact to groundwater appeared to be defined to the south (MW-3, EB-06, minor detection at EB-07) and east (MW-01 and EB-05), but appeared to be less defined to the west (comparatively elevated soil vapor concentrations in EB-04) and to the north (EB-02). Groundwater direction at the time of these investigations appears to flow to the east-southeast.

To evaluate soil vapor quality underneath the vehicle maintenance facility (VMF) building adjacent to the former fuel tank at the site, two sub-slab soil vapor samples (EB-04 and EB-05) were collected in the maintenance building between September 1 and 2, 2009. Soil vapor analytical results indicated that methane was detected in EB-05 at 0.9 percent. Tracer compound helium was detected in both soil vapor samples near 1.3 percent, indicating that a minor leak may have occurred at one of the fittings or at the air-flow regulator. Based on the concentration of tracer compound detected and compared with the helium sampling shroud concentration, it appears that the extent of ambient air intrusion was limited.

The collection of a shroud atmosphere sample was not feasible with the equipment provided by the selected drill contractor. Therefore, a comparison of the oxygen, carbon dioxide and methane concentrations of the shroud atmosphere with the collected soil vapors were not possible.

Laboratory analyses of the soil vapor samples did not detect BTEX, MTBE, or TBA above commercial ESLs and California Human Health Screening Levels (CHHSLs). Even when adjusting the detected concentration for the average leakage factor of 3 obtained during sampling, they are still significantly below the cited environmental screening levels. A comparison of the soil vapor results with the groundwater analytical results indicates that the primary chemical of concern detected in groundwater, namely MTBE, was not present in the soil vapor samples. This could possibly indicate that the source of the detected soil vapor compounds may not be necessarily related to the fuel tank source, but possibly originate from vehicle maintenance activities within the VMF and/or possible residual impacts to soil from the in-place abandoned hydraulic-lifts and associated piping. Based on the results of the limited soil vapor evaluation, general soil vapor quality beneath the vehicle maintenance facility does not appear to be a potential human health risk.

Soil vapor analytical results are presented in Table 8 below.

2.3.2.4 2009 to 2011 Groundwater Monitoring Program

During the 2009 investigation, three of the borings were converted into permanent groundwater monitoring wells, MW-1, MW-2 and MW-3. On September 9, 2009, the static water levels were measured to the nearest 0.01 foot using an electronic depth sounder. The wells were then developed using a submersible pump by purging up to ten well volumes of water to remove fine-grained material from the well and surrounding soil disturbed during well installation. The initial sampling of the newly installed wells was completed on September 14, 2009. Laboratory analyses detected MTBE in groundwater from wells MW-01 (3.7 ppb) and MW-02 (70 ppb) as shown on Table 9 below. Quarterly monitoring of MW-1, MW-2 and MW-3 was conducted from October 14, 2009 to March 23, 2011. Graphs 1, 2 and 3 present the

MTBE concentrations from MW-01, MW-02, and MW-03 with observed groundwater fluctuations at the site.

The SMCEDH reviewed the report and responded with a letter on February 26, 2010, indicating that revisions to TRC's October 14, 2009 Soil and Groundwater Quality Evaluation were required and to initiate quarterly groundwater monitoring at the site. In response to SMCEDH letter mentioned above, TRC prepared a letter dated July 12, 2010, in which TRC provided clarification and revisions to certain aspects of their October 14, 2009 report.

In their letter dated March 31, 2011, SMCEDH requested certain Geotracker tasks to be completed and furthermore provided approval to prepare a site closure summary report. The Geotracker tasks included uploading the 3rd Quarter Monitoring Report and Request for Reduced Sampling Frequency, all associated EDFs and GEOWELL files for the 2nd and 3rd Quarter 2010 reports and an updated GEOMAP of the site showing the location of the previously collected soil vapor samples. All tasks have been completed to date.

The recommendation to update the groundwater monitoring plan by decreasing the sampling interval from quarterly to semi-annual was based on the consistent results obtained from the four sampling events

prior to the sampling frequency reduction and which appeared to reflect the intent of the San Mateo County Groundwater Protection Program's (GPP) goal (GPP letter, July 7, 2009) to reduce quarterly monitoring where appropriate. Therefore, after the fourth quarterly monitoring event (our 3rd Quarter 2010 Monitoring Report) the sampling frequency was decreased to semi-annually.

In their letter the SMCEDH requested submittal of this Closure Summary by August 31, 2011. TRC will continue groundwater monitoring activities on a semi-annual basis at the site until the Site Closure determination process is complete and a *No Further Action Letter* is issued by the SMCEHD.

3.0 SUMMARY OF AVAILABLE DATA

3.1 Hydrocarbon-Impacted Soil

Soil analytical data from several exploratory borings did not indicate the presence of any significant residual soil impacts.

3.2 Hydrocarbon-Impacted Groundwater

Shallow groundwater during this reporting period appeared to continue flowing towards the southeast creating a plume of steadily decreasing MTBE concentrations from MW-2 near the source, towards MW-1 down gradient. MW-02 MTBE concentrations remain above ESL and continue to decrease with levels below the ESL detected in MW-1. No other compounds of interest were detected above ESLs in the cross-gradient well, MW-03. This indicates that the impacted groundwater continues to be limited in extent and continues to attenuate naturally.

3.3 Hydrocarbon-Impacted Soil Vapor

Soil Vapor analytical data from two exploratory borings advanced through the VMF slab did not indicate the presence of any significant residual soil vapor impacts.

4.0 SOIL AND WATER QUALITY OBJECTIVES

Based on recent monitoring results, continuous decrease of detected chemicals of concern to levels near or below ESLs is indicated. The San Francisco Bay Regional Water Quality Control Board (SFRWQCB) developed Environmental Screening Levels (ESLs) to address environmental protection goals. The ESL for MTBE in groundwater with the potential to be used for drinking water is 5.0 micrograms per liter (µg/L). The ESL for shallow soil (i.e., soils encountered at depth less than 9 feet below ground [fbg]) is 5.0 µg/L (SFRWQCB, 2008). These ESLs are proposed to be used as the water quality objectives and soil cleanup goals for the site.

Analysis of groundwater samples collected from MW-01, and MW-03 on March 23, 2011, detected concentrations that were below the 5.0 µg/L water quality objective for MTBE (ESL). Laboratory analysis of groundwater collected from monitoring well MW-2 detected a MTBE concentration of 46 µg/L which is above the groundwater quality objective. However, MTBE concentrations in groundwater underneath the site have steadily decreased and, assuming current trends continue, the water quality objective for MTBE is expected to be achieved in the next 2-3 years. In addition, the portion of the site where MTBE concentrations exceed the ESL appears limited in extend to the area immediately around MW-2. The downward concentration trend observed in groundwater is likely attributable to natural biodegradation processes active in the subsurface.

5.0 MASS CALCULATIONS

5.1 Estimation of Hydrocarbons Removed

In order to comply with the new requirement for Geotracker to enter data for removal actions, Table 10 below presents groundwater removal data, contaminant concentrations and mass removal calculations.

Since only minor amounts of soil have been removed from the site, no mass removal calculations were completed for soil. Mass removal from groundwater was calculated for TPHg and MTBE, the main contaminates of concern identified at the site. Approximately 0.0013 grams (<0.0001 lbs) of MTBE was removed during the 1st Quarter, 2011 monitoring event.

Table 10
Mass of Contaminants Removed from Groundwater
(Concentrations in micrograms per liter [(µg/L])

Well/boring Number	Date	TPHg	MTBE	Gallons Water Removed	Lbs TPHg removed	Lbs MTBE removed
GW-1	01/06/05	6,300	7,100	16,000	0.806	0.908
GW-2	01/10/05	330	<0.5	1,000	0.002	-
MW-01	09/14/09	<50	3.7	5.4	-	<0.0001
MW-01	03/25/10	<50	0.57	6.84	-	<0.0001
MW-01	6/30/10	<40	<0.63	6.0	-	-
MW-01	9/22/10	<50	**6.5**	5.0	-	<0.0002
MW-01	3/23/11	<50	1.2	7.0	-	<0.0001
MW-02	09/14/09	<50	**70**	5.46	-	<0.0001
MW-02	03/25/10	<50	**72**	7.5	-	<0.0001
MW-02	6/30/10	<40	**56**	6.0	-	<0.0001
MW-02	9/22/10	<50	**64**	5.0	-	<0.0001
MW-02	3/23/11	<50	**46**	7.0	-	<0.0001
MW-03	09/14/09	<50	<0.5	5.04	-	-
MW-03	03/25/10	<50	<0.5	6.5	-	-
MW-03	6/30/10	<40	<0.63	6.0	-	-
MW-03	9/22/10	<50	<0.5	5.0	-	-
MW-03	3/23/11	<50	<0.5	7.0	-	-
Total Mass Removed				**17,090.74**	**0.808**	**0.908**

- Mass removal not calculated since concentrations of constituents of concerns (COC) were below laboratory reporting limit

5.2 Estimation of Residual Hydrocarbons

The residual hydrocarbons remaining in the soil and groundwater at the site appears to be very limited in extent. Soil samples collected in 2009 did not detect any petroleum hydrocarbons and associated compounds (BTEX, MTBE) above the residential ESL. During the most recent groundwater monitoring event, MTBE was detected above the ESL in only one of the on-site monitoring wells at a moderate concentration of 46 µg/L. An estimation of residual hydrocarbons was therefore not completed as part of this closure summary.

5.3 Time to Achieve Water Quality Objectives

As discussed in Section 4.0, the proposed ESL water quality objective of 5.0 µg/L for MTBE in groundwater will subsequently be achieved. On March 23, 2011 groundwater quality measured in monitoring wells MW-1 (1.2 µg/L) and MW-3 (<0.5 µg/L) were below the environmental cleanup goal for the site. Although the water quality objective has still not been accomplished for MW-02 (46 µg/L), the projection of diminished concentrations is consistent with historical trends in all on-site wells. Based on

the current (since 2009, see trend graphs) and the previous trend data (1991-2001) it is estimated that the groundwater quality objective in MW-2 will be achieved within the next 2-3 years.

6.0 CONCEPTUAL SITE MODEL

A conceptual site model (CSM) was prepared for the site to assess and identify potential exposure pathways from contaminant sources to human and/or ecological receptors. A CSM should:

(1) Identify known or suspected sources of contamination.
(2) Consider how and where the contaminants are likely to migrate (pathways).
(3) Identify who is likely to be affected by them (receptors).

Elements of item 2 more precisely fall into the category of a hydrogeologic conceptual model, which describes site geology, hydrology, hydrogeology, and contaminant fate and transport; and elements of item 3 above may be classified as a risk exposure conceptual model, which describes potential routes of exposure to potential receptors.

6.1 Sources

Figure 5 illustrates the site CSM. As outlined in the figure, potential on-site sources from past operations include:

- Former USTs
- Former Fuel loading, dispensers and product lines
- On-site USPS Vehicle Maintenance Facility
- Fill materials
- Stormwater discharge locations

Potential impacts from off-site sources include:

- Sediment/surface water impacts from off-site stormwater discharge
- Known and identified surface soil and groundwater impacts from neighboring former Carwash

All former USTS have been removed from the site. The impact to soil appears minimal and the impact to groundwater was assessed through a mass calculation (see Section 5). An estimation of the hydrocarbon mass released over time is not provided at this time. Other than UST removal, no remedial activities have been performed at the site.

6.2 Hydrogeologic Conceptual Model

The upper approximately 3 to 5 feet of soil consists of silty soils mixed with varying amounts of debris The fill unit in turn is underlain by apparent Holocene alluvial and fluvial deposits (Qhaf) that at the site consists of a sedimentary sequence of fine-grained sedimentary deposits, including silty clays and fat clays, underlain by more permeable sandy units with occasional gravel below (see Geologic Cross Section, Figure. 3).

Potential contaminant transport pathways from site sources to potential receptors are illustrated in Figure 5. The three release mechanisms at the site are:

- Aboveground releases to surface soil
- Underground releases to subsurface soil
- Engineered discharge to surface water and surface sediments

Contaminants may migrate through surface soil, subsurface soil, groundwater, surface water, and air along the various pathways illustrated in Figure 5. Contaminant mobility depends on chemical properties (e.g., solubility, sorption tendency, volatility), soil properties (e.g., hydraulic conductivity, porosity), soil

chemistry (e.g., presence of compounds that affect biodegradation), and the groundwater gradient and degree of hydraulic communication between groundwater and surface water.

The nearest surface water consists of a drainage channel, located approximately 520 feet northeast of the property, as indicted in Figure 1. The drainage channel eventually empties into the waters of the San Francisco Bay. However, based on the distance from the site and the general groundwater flow direction measured at the site, the channel is unlikely to be significantly impacted from the USPS site and is therefore not considered a potential sensitive receptor.

6.3 Risk Exposure Conceptual Model

The risk exposure model is presented in Figure 5. Receptors may potentially come into contact with any of the contaminant migration pathway endpoints (exposure routes), including:

- Inhalation of dust-borne particulates
- Inhalation of vapors from soil or groundwater
- Ingestion of or dermal contact with soil
- Ingestion of or dermal contact with groundwater
- Ingestion of or dermal contact with sediment

Potential receptor populations may include on-site workers and construction workers. The receptor list can be modified if site use plans are altered. Each exposure route was evaluated as either:

- Incomplete, meaning that there is no possibility for the receptor to come into contact with contaminants via the exposure route
- Complete, meaning that it is potentially significant mechanism of exposure
- Complete but insignificant, meaning that it is not considered to be a significant source of contaminants via the exposure route

7.0 REMAINING SITE CONDITIONS

Based on the results of continued groundwater monitoring it appeared that the natural attenuation through biodegradation helped to significantly reduce the concentrations in the contaminant plume and, therefore, reduce further impacts to the USPS property.

The results of a CSM prepared for the site show that the subsurface soil and groundwater conditions at the site have been well characterized. The exposure evaluation flowchart as part of the CSM, presented on Figure 5, lists the “potential receptors” to potentially present residual petroleum hydrocarbons and MTBE detected in the site’s soil and groundwater.

There does not appear to be a significant threat to these “potential receptors” since: 1) the affected soils are generally greater than 5 feet deep and the site is completely covered by pavement and on-site structures; 2) soil vapor results indicate that potential vapor intrusion into the on-site structures located above the affected soil and groundwater is less than significant; and 3) the source USTs have been removed and the former tank pit over-excavated, the remaining residual petroleum hydrocarbon concentrations would be expected to naturally degrade over time.

8.0 CONCLUSIONS AND RECOMMENDATION

In accordance with regulatory guidance, data compilations and evaluations have been conducted to support this Closure Request. These include the following:

- Data for soil and groundwater chemistry and groundwater elevations have been compiled and summarized over an extended period of investigations (January 2005 to March 2011). These data are summarized in Tables 1 (groundwater elevations), Table 2 (soil), and Table 3 (groundwater), in Figure 3 (cross sections A-A’ and B-B’) and Figure 4 (groundwater elevation contour map), and Graphs 1-3 (MTBE and groundwater trends).

- Site investigations conducted over the last 6.5 years have led to a comprehensive understanding of site conditions and those conditions have been summarized in Sections 2.0 and 3.0. MTBE has been the main contaminant of concern identified at the site. As demonstrated in these investigations and data summaries, the nature and extent of impacts at the site and in its vicinity have been adequately characterized. The plume is stable and residual MTBE impacts to groundwater are relatively low in concentration and continuously declining via natural attenuation.

- A conceptual site model has been prepared for the site to assess and identify potential exposure pathways from contaminant sources to human and/or ecological receptors. Based on the conceptual model, the current and potential risks to human and ecological health were found to be less than significant. It is our professional opinion that the conditions remaining at the site will not adversely impact groundwater quality, health, or other beneficial uses.

The following conclusions are therefore noted:

- Although MTBE concentrations remain above the ESL objective of 5.0 µg/L at MW-02 (46 µg/L, 3/23/11), it appears that natural attenuation will provide a sufficient mechanism for further contaminant degradation. Based on current and historic degradation trends established for the site, it is anticipated that the groundwater quality objective will be achieved in the near future.

- In accordance with the "Regional Board Supplemental Instructions to State Water Board December 8, 1995, Interim Guidance on Required Cleanup at Low-Risk Fuel Sites" (Water Board, January 5, 1996), this site is considered a low-risk fuel site. This is based on the fact that there is no ongoing source, no free product, the site has been adequately characterized, there is little or no groundwater impact, no drinking water well or surface water that is likely to be impacted, and the site presents no significant risk to human health or the environment.

- As such, *no further action* (NFA) with respect to site characterization or monitoring is warranted, and the site should be referred for regulatory closure. Pending agency concurrence with the NFA recommendation and closure request, the remaining three (3) monitoring wells will be properly destroyed.

Comments (Depth of Remediation, etc.):

Data from TRC Lowney, 2006.

Beneath former underground storage tanks, impacted soil was excavated to depths ranging from 9 to 13 feet below ground surface. Confirmation samples were collected to ensure the removal of all soil with contaminant of concern concentrations in exceedance of the RWQCB-approved remedial goals.

* Lowney, 2005

VI. ADDITIONAL COMMENTS, DATA, ETC.

Please see the Draft Closure Summary Report for detailed information on the site investigation and cleanup.

Based on the results of the soil and groundwater investigations, this site does not pose significant risk to human health or the environment. In accordance with the "Regional Board Supplemental Instructions to State Water Board December 8, 1995, Interim Guidance on Required Cleanup at Low-Risk Fuel Sites" (Water Board, January 5, 1996), this site is considered a low-risk fuel site. This is based on the fact that there is no ongoing source, no free product, the site has been adequately characterized, there is little or no groundwater impact, no drinking water well or surface water is likely to be impacted, and the site presents no significant risk to human health or the environment.

TRC recommends that the remaining three monitoring wells be destroyed in accordance with SMCEHD guidelines and a No Further Action letter be submitted for this site.

This document and the related CASE CLOSURE LETTER, shall be retained by the lead agency as part of the official site file.

APPENDIX B

SOIL AND GROUNDWATER SAMPLING PROTOCOL, MONITORING WELL PROTOCOL, BORING LOGS AND MW DWRS

Soil Sampling Protocol:

The subsurface investigations were performed on August 31 to September 2, 2009, using a limited access, hydraulic coring rig. Seven soil borings were drilled to depths of approximately 16 feet. Soils encountered in the borings were logged using the Unified Soil Classification System (ASTM D-2487). The logs of the borings, as well as a key to the classification of soil (Figure A-1), are included as part of this appendix.

Soils encountered in the borings were logged using the Unified Soil Classification System (ASTM D-2487). The logs of the borings, as well as a key to the classification of soil (Figure A-1), are included as part of this appendix.

Soil samples for laboratory analysis were collected in acetate or brass liners, the ends of the liners were covered in Teflon film, fitted with plastic end caps, taped, and labeled with a unique identification number. The samples were then placed in an ice-chilled cooler, and transported to a state-certified analytical laboratory with chain of custody documentation. Soil vapors from each sample were also monitored with an organic vapor meter (OVM) by first placing the soil in a Ziplock™ bag for several minutes. The OVM probe was then used to pierce the bag and record the organic vapor levels present.

All drilling and sampling equipment was cleaned in a solution of laboratory grade detergent and distilled water or steam cleaned before use at each sampling point.

Groundwater Sampling Protocol:

Borings where groundwater was encountered were converted into “temporary” wells with the installation of 1-inch I.D. flush-threaded, Schedule 40 PVC casing. The casing in the lower portion of the well had 0.02-inch factory machined slots. Groundwater grab samples were collected from the temporary wells with a ball check-valve attachment to an appropriate length of Teflon tube. Samples were collected in glass VOA sample bottles, labeled, and immediately placed into an ice-chilled chest for delivery to a state-certified analytical laboratory for analysis.

All drilling and sampling equipment was cleaned in a solution of laboratory grade detergent and distilled water or steam-cleaned before use at each sampling point.

Monitoring Well Surveying and Development, and Groundwater Sampling

To evaluate the groundwater flow direction, the locations of each monitoring well’s Christy box upper surface were established using GPS equipment. The relative top-of-casing elevations of the monitoring wells were then measured to the nearest 0.01 foot below the box lid.

Approximately 48 hours after well installation, the static water levels were measured to the nearest 0.01 foot using an electronic depth sounder. The wells were then developed by purging several well volumes of water to remove fine-grained material from the well and surrounding soil disturbed during well installation and improve the yield of the well.

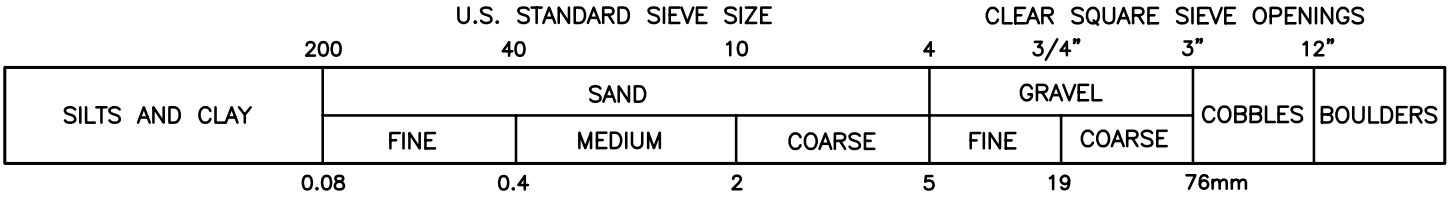
Approximately 48 hours after development, groundwater from the monitoring wells was sampled. A Teflon bailer or submersible pump was used to purge a minimum of three-well casing volumes of water from each well. After purging each well volume, pH, temperature, and conductivity measurements were recorded. In general, these measurements stabilize (consecutive readings within 10 percent) after three to four well volumes. If, after the third well volume the pH and conductivity did not stabilize, additional well volumes were removed until these measurements did stabilize. If the yield was low and the well was pumped dry, the well was allowed to recharge to the 80 percent level before sampling. Samples were

collected in appropriate sample bottles, labeled, and immediately placed into an ice-chilled chest for delivery to a state-certified analytical laboratory for analysis.

All well development and sampling equipment was cleaned in a solution of laboratory grade detergent and distilled water or steam cleaned before use at each sampling point. Well development and sampling records are attached as part of this appendix. The DWR-188 Well Completion Reports are included in this appendix.

PRIMARY DIVISIONS			SOIL TYPE		SECONDARY DIVISIONS
COARSE GRAINED SOILS — MORE THAN HALF OF MATERIAL IS LARGER THAN NO. 200 SIEVE SIZE	GRAVELS — MORE THAN HALF OF COARSE FRACTION IS LARGER THAN NO. 4 SIEVE	CLEAN GRAVELS (Less than 5% Fines)	GW		Well graded gravels, gravel–sand mixtures, little or no fines
			GP		Poorly graded gravels or gravel–sand mixtures, little or no fines
		GRAVEL WITH FINES	GM		Silty gravels, gravel–sand–silt mixtures, plastic fines
			GC		Clayey gravels, gravel–sand–clay mixtures, plastic fines
	SANDS — MORE THAN HALF OF COARSE FRACTION IS SMALLER THAN NO. 4 SIEVE	CLEAN SANDS (Less than 5% Fines)	SW		Well graded sands, gravelly sands, little or no fines
			SP		Poorly graded sands or gravelly sands, little or no fines
		SANDS WITH FINES	SM		Silty sands, sand–silt–mixtures, non–plastic fines
			SC		Clayey sands, sand–clay mixtures, plastic fines
FINE GRAINED SOILS — MORE THAN HALF OF MATERIAL IS SMALLER THAN NO. 200 SIEVE SIZE	SILTS AND CLAYS — LIQUID LIMIT IS LESS THAN 50 %		ML		Inorganic silts and very fine sands, rock flour, silty or clayey fine sands or clayey silts with slight plasticity
			CL		Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays
			OL		Organic silts and organic silty clays of low plasticity
	SILTS AND CLAYS — LIQUID LIMIT IS GREATER THAN 50 %		MH		Inorganic silts, micaceous or diatomaceous fine sandy or silty soils, elastic silts
			CH		Inorganic clays of high plasticity, fat clays
			OH		Organic clays of medium to high plasticity, organic silts
HIGHLY ORGANIC SOILS			PT		Peat and other highly organic soils

DEFINITION OF TERMS



GRAIN SIZES

APPENDIX C

CERTIFIED ANALYTICAL REPORTS AND CHAIN-OF-CUSTODY DOCUMENTATION

The chilled samples were delivered to a state-certified analytical laboratory. Chain of custody documentation was maintained for all samples. Attached are copies of the analytical results and the chain of custody forms.

Dear Mr. Arniola,

Attached is our report for your samples received on 01/10/2005 18:29
This report has been reviewed and approved for release. Reproduction of this report is permitted only in its entirety.

Please note that any unused portion of the samples will be discarded after 02/24/2005 unless you have requested otherwise.
We appreciate the opportunity to be of service to you. If you have any questions, please call me at (925) 484-1919.
You can also contact me via email. My email address is: asalimpour@stl-inc.com

Sincerely,

Afsaneh Salimpour

Sample Receipt Checklist

Submission #:2005- 01 - 0238

Checklist completed by: (initials) MN Date: 01/10/05

Courier name: ☒ STL San Francisco ☐ Client _____

Custody seals intact on shipping container/samples	Yes___	No___	Not Present ✓
Chain of custody present?	Yes ✓	No___	
Chain of custody signed when relinquished and received?	Yes ✓	No___	
Chain of custody agrees with sample labels?	Yes ✓	No___	
Samples in proper container/bottle?	Yes ✓	No___	
Sample containers intact?	Yes ✓	No___	
Sufficient sample volume for indicated test?	Yes___	No ✓	
All samples received within holding time?	Yes ✓	No___	
Container/Temp Blank temperature in compliance (4° C ± 2)? Temp: 2c	Yes ✓	No___	

Potential reason for > 6°C - Ice melted ☐ Ice in bags ☐ Not enough ice ☐ Not enough blue ice ☐ Samples in boxes ☐

Sampled<4hr. ago? ☐ Ice not required (e.g. air or bulk sample) ☐

Ice Present	Yes ✓	No___	
Water - VOA vials have zero headspace? No VOA vials submitted___	Yes ✓	No___	

(if bubble is present, refer to approximate bubble size and itemize in comments as S (small ~O), M (medium ~ O) or L (large ~ O)

Water - **pH acceptable upon receipt?** ☐ Yes ☐ No

☒ **pH adjusted** - Preservative used: ☒ HNO_3 ☐ HCl ☐ H_2SO_4 ☐ NaOH ☐ ZnOAc - **Lot #(s)** A29045 / MO105X

For any item check-listed "No", provided detail of discrepancy in comment section below:

Comments: GW-2 SAMPLE SPLIT & PRESERVED IN LAB.
ONLY (1) 1L AMBER RECD FOR GW-2 FOR DIESEL & O&G.
O&G LOGGED ON-HOLD.

Project Management [Routing for instruction of indicated discrepancy(ies)]

Project Manager: (initials) AS Date: 01/11/05

Client contacted: ☒ Yes ☐ No

Summary of discussion: Per Mark he will try to do more Samples
Run O&G from the Diesel bottle it is OK to run
w. RL's

Dear Mr. Arniola,

Attached is our report for your samples received on 01/07/2005 15:48
This report has been reviewed and approved for release. Reproduction of this report is permitted only in its entirety.

Please note that any unused portion of the samples will be discarded after 02/21/2005 unless you have requested otherwise.
We appreciate the opportunity to be of service to you. If you have any questions, please call me at (925) 484-1919.
You can also contact me via email. My email address is: asalimpour@stl-inc.com

Sincerely,

Afsaneh Salimpour
Project Manager

Sample Receipt Checklist

Submission #:2005- 01 . 0178

Checklist completed by: (initials) MN Date 01.07.05

Courier name: ☒ STL San Francisco ☐ Client: _____

Custody seals intact on shipping container/samples	Yes ___ No ___	Not Present ✓
Chain of custody present?	Yes ✓	No ___
Chain of custody signed when relinquished and received?	Yes ✓	No ___
Chain of custody agrees with sample labels?	Yes ✓	No ___
Samples in proper container/bottle?	Yes ✓	No ___
Sample containers intact?	Yes ✓	No ___
Sufficient sample volume for indicated test?	Yes ✓	No ___
All samples received within holding time?	Yes ✓	No ___
Container/Temp Blank temperature in compliance (4^0 C ± 2)?	Temp: 2 °C Yes ✓	No ___

Potential reason for > 6°C - Ice melted ☐ Ice in bags ☐ Not enough ice ☐ Not enough blue ice ☐ Samples in boxes ☐

Sampled<4hr. ago? ☐ Ice not required (e.g. air or bulk sample) ☐

Water - VOA vials have zero headspace?	Ice Present Yes ✓	No ___
	No VOA vials submitted ___ Yes ✓	No ___

(if bubble is present, refer to approximate bubble size and itemize in comments as S (small ~ O), M (medium ~ O) or L (large ~ O)

Water - pH acceptable upon receipt? ☐ Yes ☐ No

☐ pH adjusted– Preservative used: ☐ HNO_3 ☐ HCl ☐ H_2SO_4 ☐ NaOH ☐ ZnOAc –Lot #(s) _____

For any item check-listed "No", provided detail of discrepancy in comment section below:

Comments:

CASE NARRATIVE

Analytical Comments for METHOD 8015_S_DSL LL, SAMPLE 073445-010A: Sample contains hydrocarbons within the diesel range that do not match the diesel pattern. Quantitation was based on a diesel standard.

Qualifiers:

ND - Not Detected at the Reporting Limit
J - Analyte detected below quantitation limits
B - Analyte detected in the associated Method Blank
DO - Surrogate Diluted Out
S - Spike/Surrogate outside of limits due to matrix interferen
H - Sample exceeded analytical holding time
E - Value above quantitation range
R - RPD outside acceptable recovery limits

Results are wet unless otherwise specified

Dear Mr. Arniola,

Attached is our report for your samples received on 01/10/2005 18:29
This report has been reviewed and approved for release. Reproduction of this report is permitted only in its entirety.

Please note that any unused portion of the samples will be discarded after 02/24/2005 unless you have requested otherwise.
We appreciate the opportunity to be of service to you. If you have any questions, please call me at (925) 484-1919.
You can also contact me via email. My email address is: asalimpour@stl-inc.com

Sincerely,

Afsaneh Salimpour
Project Manager

Sample Receipt Checklist

Submission #:2005- 01-0238

Checklist completed by: (initials) MN Date: 01/10/05

Courier name: ☒ STL San Francisco ☐ Client _____

Custody seals intact on shipping container/samples	Yes ___	No ___	Not Present ✓
Chain of custody present?	Yes ✓	No ___	
Chain of custody signed when relinquished and received?	Yes ✓	No ___	
Chain of custody agrees with sample labels?	Yes ✓	No ___	
Samples in proper container/bottle?	Yes ✓	No ___	
Sample containers intact?	Yes ✓	No ___	
Sufficient sample volume for indicated test?	Yes ___	No ✓	
All samples received within holding time?	Yes ✓	No ___	
Container/Temp Blank temperature in compliance (4° C ± 2)? Temp: 2°C	Yes ✓	No ___	
Water - VOA vials have zero headspace? Ice Present	Yes ___	No ___	
No VOA vials submitted ___	Yes ✓	No ___	

Potential reason for > 6°C - Ice melted ☐ Ice in bags ☐ Not enough ice ☐ Not enough blue ice ☐ Samples in boxes ☐

Sampled<4hr. ago? ☐ Ice not required (e.g. air or bulk sample) ☐

(if bubble is present, refer to approximate bubble size and itemize in comments as S (small ~ O), M (medium ~ O) or L (large ~ O)

Water - **pH acceptable upon receipt?** ☐ Yes ☐ No

☒ **pH adjusted** – Preservative used: ☒ HNO_3 ☐ HCl ☐ H_2SO_4 ☐ NaOH ☐ ZnOAc –**Lot #(s)** A29045 / MO105A

For any item check-listed "No", provided detail of discrepancy in comment section below:

Comments: GW-2 SAMPLE SPLIT & PRESERVED IN LAB.
ONLY (1) 1L AMBER RECD FOR GW-2 FOR DIESEL & O&G.
O&G LOGGED ON-HOLD.

Project Management [Routing for instruction of indicated discrepancy(ies)]

Project Manager (initials) YS Date: 01/11/05

Client contacted: ☒ Yes ☐ No

Summary of discussion: Per Mark he will try to do more samples
Run O&G from the Diesel bottle it is OK to run
w/ RL's

Order No.: 0909023

Dear Kier Bass:

Torrent Laboratory, Inc. received 9 samples on 9/2/2009 for the analyses presented in the following report.

All data for associated QC met EPA or laboratory specification(s) except where noted in the case narrative.
Reported data is applicable for only the samples received as part of the order number referenced above.

Torrent Laboratory, Inc, is certified by the State of California, ELAP #1991. If you have any questions regarding these tests results, please feel free to contact the Project Management Team at (408)263-5258;ext: 204.

Sincerely,

Laboratory Director 9/9/09 Date

Patti Sandrock
QA Officer

Definitions, legends and Notes

Note	Description
ug/kg	Microgram per kilogram (ppb, part per billion).
ug/L	Microgram per liter (ppb, part per billion).
mg/kg	Milligram per kilogram (ppm, part per million).
mg/L	Milligram per liter (ppm, part per million).
LCS/LCSD	Laboratory control sample/laboratory control sample duplicate.
MDL	Method detection limit.
MRL	Modified reporting limit. When sample is subject to dilution, reporting limit times dilution factor yields MRL.
MS/MSD	Matrix spike/matrix spike duplicate.
N/A	Not applicable.
ND	Not detected at or above detection limit.
NR	Not reported.
QC	Quality Control.
RL	Reporting limit.
% RPD	Percent relative difference.
a	pH was measured immediately upon the receipt of the sample, but it was still done outside the holding time.
sub	Analyzed by subcontracting laboratory, Lab Certificate #

These analyses were performed according to State of California Environmental Laboratory Accreditation program, Certificate # 1991

RE: 165446/ USPS San Mateo VMF

Order No.: 0909093

Dear Kier Bass:

Torrent Laboratory, Inc. received 3 samples on 9/15/2009 for the analyses presented in the following report.

All data for associated QC met EPA or laboratory specification(s) except where noted in the case narrative.
Reported data is applicable for only the samples received as part of the order number referenced above.

Torrent Laboratory, Inc, is certified by the State of California, ELAP #1991. If you have any questions regarding these tests results, please feel free to contact the Project Management Team at (408)263-5258;ext: 204.

Sincerely,

Laboratory Director 9/22/09 Date

Patti Sandrock
QA Officer

Definitions, legends and Notes

Note	Description
ug/kg	Microgram per kilogram (ppb, part per billion).
ug/L	Microgram per liter (ppb, part per billion).
mg/kg	Milligram per kilogram (ppm, part per million).
mg/L	Milligram per liter (ppm, part per million).
LCS/LCSD	Laboratory control sample/laboratory control sample duplicate.
MDL	Method detection limit.
MRL	Modified reporting limit. When sample is subject to dilution, reporting limit times dilution factor yields MRL.
MS/MSD	Matrix spike/matrix spike duplicate.
N/A	Not applicable.
ND	Not detected at or above detection limit.
NR	Not reported.
QC	Quality Control.
RL	Reporting limit.
% RPD	Percent relative difference.
a	pH was measured immediately upon the receipt of the sample, but it was still done outside the holding time.
sub	Analyzed by subcontracting laboratory, Lab Certificate #

These analyses were performed according to State of California Environmental Laboratory Accreditation program, Certificate # 1991

RE: 165446 / USPS San Mateo VMF

Order No.: 0909038

Dear Kier Bass:

Torrent Laboratory, Inc. received 14 samples on 9/4/2009 for the analyses presented in the following report.

All data for associated QC met EPA or laboratory specification(s) except where noted in the case narrative.
Reported data is applicable for only the samples received as part of the order number referenced above.

Torrent Laboratory, Inc, is certified by the State of California, ELAP #1991. If you have any questions regarding these tests results, please feel free to contact the Project Management Team at (408)263-5258;ext: 204.

Sincerely,

Laboratory Director

Definitions, legends and Notes

Note	Description
ug/kg	Microgram per kilogram (ppb, part per billion).
ug/L	Microgram per liter (ppb, part per billion).
mg/kg	Milligram per kilogram (ppm, part per million).
mg/L	Milligram per liter (ppm, part per million).
LCS/LCSD	Laboratory control sample/laboratory control sample duplicate.
MDL	Method detection limit.
MRL	Modified reporting limit. When sample is subject to dilution, reporting limit times dilution factor yields MRL.
MS/MSD	Matrix spike/matrix spike duplicate.
N/A	Not applicable.
ND	Not detected at or above detection limit.
NR	Not reported.
QC	Quality Control.
RL	Reporting limit.
% RPD	Percent relative difference.
a	pH was measured immediately upon the receipt of the sample, but it was still done outside the holding time.
sub	Analyzed by subcontracting laboratory, Lab Certificate #

These analyses were performed according to State of California Environmental Laboratory Accreditation program, Certificate # 1991

Hi Nutan,

Please run total lead on sample number EB-03-08.5, standard turnaround for soil disposal opitions.

Sincerely,

Kier Bass
Staff Environmental Scientist

ANALYTICAL REPORT

Job Number: 720-26910-1

Job Description: USPS San Mateo VMF

For:
TRC Solutions, Inc.
167 Filbert St.
Oakland, CA 94607

Attention: Mr. Charles Mettler

Surinder Sidhu

Approved for release.
Surinder Sidhu
Customer Service Manager
3/31/2010 5:03 PM

Designee for
Dimple Sharma
Project Manager I
dimple.sharma@testamericainc.com
03/31/2010

CA ELAP Certification # 2496
The Chain(s) of Custody are included and are an integral part of this report.
The report shall not be reproduced except in full, without the written approval of the laboratory. The client, by accepting this report, also agrees not to alter any reports whether in the hard copy or electronic format and to use reasonable efforts to preserve the reports in the form and substance originally provided by TestAmerica.
A trip blank is required to be provided for volatile analyses. If trip blank results are not included in the report, either the trip blank was not submitted or requested to be analyzed.

TestAmerica Laboratories, Inc.
TestAmerica San Francisco 1220 Quarry Lane, Pleasanton, CA 94566
Tel (925) 484-1919 Fax (925) 600-3002 www.testamericainc.com

Comments
No additional comments.

Receipt
All samples were received in good condition within temperature requirements.

GC/MS VOA
No analytical or quality issues were noted.

EXECUTIVE SUMMARY - Detections

Question	T / F/ NA	Comment
Radioactivity either was not measured or, if measured, is at or below background	N/A	
The cooler's custody seal, if present, is intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
If necessary, staff have been informed of any short hold time or quick TAT needs	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Is the Field Sampler's name present on COC?	True	
Sample Preservation Verified	True

Quality Control Summary
SDG: L466959

For: TRC Solutions - CA
Project: SM USPS
July 15, 2010

Sample Receiving and Handling

All sample aliquots were received at the correct temperature, in the proper containers, and with the appropriate preservatives. All method specified holding times were met.

Method 8015D/GRO

Laboratory Control Sample

Samples L466959-02, -03, and -01 were analyzed in analytical batch WG487678. The laboratory control sample associated with these samples was within the laboratory control limits for all compounds.

Matrix Spike/Matrix Spike Duplicate

For analytical batch WG487678 matrix spike/matrix spike duplicate analysis was performed on sample L466959-02. The matrix spike recoveries were above laboratory control limits for TPH (GC/FID) Low Fraction. The spike recoveries for the remaining target compounds were within limits. The relative percent difference exceeded laboratory limits for TPH (GC/FID) Low Fraction.

Blank Analysis

The method blank, the initial, and all continuing calibration blanks contained no analytes at concentrations above the method reporting limit.

Volatile Organic Compounds by Method 8260B

Laboratory Control Sample

Samples L466959-01, -03, and -02 were analyzed in analytical batch WG488093. The laboratory control sample associated with these samples was within the laboratory control limits for all compounds.

Sample L466959-04 was analyzed in analytical batch WG488147. The laboratory control sample associated with this sample was within the laboratory control limits for all compounds.

Matrix Spike/Matrix Spike Duplicate

For analytical batch WG488093 matrix spike/matrix spike duplicate analysis was performed on sample L467022-01. The matrix spike recoveries and relative percent differences were within laboratory control limits for all target analytes.

For analytical batch WG488147 matrix spike/matrix spike duplicate analysis was performed on sample L466950-01. The matrix spike recoveries were within laboratory control limits for all target analytes. The relative percent difference exceeded laboratory limits for 2-Chloroethyl vinyl ether and 1,1,2,2-Tetrachloroethane.

Blank Analysis

The method blank, the initial, and all continuing calibration blanks contained no analytes at concentrations above the method reporting limit.

Attachment A
List of Analytes with QC Qualifiers

Sample Number	Work Group	Sample Type	Analyte	Run ID	Qualifier
L466959-02	WG487678	SAMP	TPH (GC/FID) Low Fraction	R1280988	J5J3
	WG488093	SAMP	Total Xylenes	R1284911	J
L466959-04	WG488147	SAMP	Acetone	R1285089	J

Attachment B
Explanation of QC Qualifier Codes

Qualifier	Meaning
J	(EPA) - Estimated value below the lowest calibration point. Confidence correlates with concentration.
J3	The associated batch QC was outside the established quality control range for precision.
J5	The sample matrix interfered with the ability to make any accurate determination; spike value is high

Qualifier Report Information

ESC utilizes sample and result qualifiers as set forth by the EPA Contract Laboratory Program and as required by most certifying bodies including NELAC. In addition to the EPA qualifiers adopted by ESC, we have implemented ESC qualifiers to provide more information pertaining to our analytical results. Each qualifier is designated in the qualifier explanation as either EPA or ESC. Data qualifiers are intended to provide the ESC client with more detailed information concerning the potential bias of reported data. Because of the wide range of constituents and variety of matrices incorporated by most EPA methods,it is common for some compounds to fall outside of established ranges. These exceptions are evaluated and all reported data is valid and useable "unless qualified as 'R' (Rejected)."

Definitions

Accuracy - The relationship of the observed value of a known sample to the true value of a known sample. Represented by percent recovery and relevant to samples such as: control samples, matrix spike recoveries, surrogate recoveries, etc.

Precision - The agreement between a set of samples or between duplicate samples. Relates to how close together the results are and is represented by Relative Percent Difference.

Surrogate - Organic compounds that are similar in chemical composition, extraction, and chromotography to analytes of interest. The surrogates are used to determine the probable response of the group of analytes that are chemically related to the surrogate compound. Surrogates are added to the sample and carried through all stages of preparation and analyses.

TIC - Tentatively Identified Compound: Compounds detected in samples that are not target compounds, internal standards, system monitoring compounds, or surrogates.

Summary of Remarks For Samples Printed
07/14/10 at 11:42:18

TSR Signing Reports: 358
R5 - Desired TAT

Log all samples for QC2MODCN. All samples get MDL/RDL reporting. Log DROCA and DROCAER under the LVI products when applicable.

Quality Control Summary
SDG: L466959
TRC Solutions - CA

Test: Volatile Organic Compounds by Method 8260B
Project No: 165446
Project: SM USPS
Collection Date: 6/30/2010
Analysis Date: 7/13/2010
Instrument ID: VOCMS13
Sample Numbers: L466959-04

Matrix: Water - mg/L
EPA ID: TN00003
Analytic Batch: WG488147
Analyst: 73

Method Blank

Analyte	CAS	PQL	Qualifiers
Tetrachloroethene	127-18-4	<0.0010	
1,3-Dichloropropane	142-28-9	<0.0010	
Chlorodibromomethane	124-48-1	<0.0010

List Number: 1

Question	T / F/ NA	Comment
Radioactivity either was not measured or, if measured, is at or below background	N/A	
The cooler's custody seal, if present, is intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
If necessary, staff have been informed of any short hold time or quick TAT needs	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis.
EPA	United States Environmental Protection Agency
ND	Not Detected above the reporting level.
MDL	Method Detection Limit
RL	Reporting Limit
RE, RE1 (etc.)	Indicates a Re-extraction or Reanalysis of the sample.
%R	Percent Recovery
RPD	Relative Percent Difference, a measure of the relative difference between two points.

Comments
No additional comments.

Receipt
Received 2 Trip Blanks with no analysis requested for them or were not requested to be put on HOLD. Logged this sample on HOLD.

All other samples were received in good condition within temperature requirements.

GC/MS VOA
Method(s) 8260B: The following sample 34152-2 and 3 submitted for volatiles analysis was received with insufficient preservation (pH >2): (720-34152-3 MS), (720-34152-3 MSD), 03244PGE-35 (720-34152-3).

No other analytical or quality issues were noted.

Subject: Phase II Environmental Site Assessment
Station Park Green
1700, 1750 and 1790 S. Delaware Street
San Mateo, California
Versar Project No. 105071.0053.002

Dear Mr. O'Shea:

Enclosed please find Versar, Inc.'s report titled *Phase II Environmental Site Assessment, Station Park Green, 1700, 1750 and 1790 S. Delaware Street, San Mateo, California* (Site). This investigation has assessed potential environmental liabilities identified in Versar's Phase I Environmental Site Assessment (ESA) dated December 13, 2013. In the Phase I ESA, Versar identified the reasonable potential for environmental liabilities associated with the current and historical auto repair and gasoline dispensing operations at the current Shell station and former Montgomery Ward auto center (now a Michael's Arts and Crafts), as well as a variety of historical industrial usages along the western portion of the Site. Off-Site impacts in groundwater from the western up-gradient properties also appear likely.

Versar has identified actionable concentrations in groundwater for benzene; Total Petroleum Hydrocarbons (TPH) in the gasoline, diesel and motor oil ranges; nickel, lead and cadmium; and the Volatile Organic Compounds (VOCs) 1,2-Dichloroethane (1,2-DCA) and Methylene Chloride. Actionable concentrations in soil were identified for TPH and lead. In soil vapor, the benzene concentration at the north side of the Shell station was elevated. A low concentration of polychlorinated biphenyls (PCBs) was also identified behind the Michael's building.

The results of the investigation suggest an apparent release to soil and groundwater of TPH, lead and possibly PCBs from the former oil/water separator on the south side of the Michaels building; VOCs in groundwater and soil vapor, and metals in groundwater, likely coming from the Shell service station; a perched layer of groundwater in the southwest corner of the Site with high concentrations of gasoline, diesel fuel and oil; elevated nickel in groundwater along the southwest property line; and TPH in the oil and diesel fuel in soil between the Kmart and the west property line.

Please contact me at (916) 863-9323 should you have any questions or comments regarding this report. Thank you for the opportunity to provide our professional technical services to Essex Property Trust.

Sincerely,

Tim Berger, R.E.A., P.G.

SECTION 1.0

EXECUTIVE SUMMARY

Versar, Inc. (Versar) has performed a Phase II Environmental Site Assessment (ESA) of the Station Park Green property located at 1700, 1750 and 1790 S. Delaware Street, in San Mateo, San Mateo County, California (Site), as shown in Figure 1, Site Location Map. This report has been prepared to conform with the scope and limitations of the American Society for Testing and Materials Standard Practice E1903-97, *Standard Guide for Environmental Site Assessments: Phase II Environmental Site Assessment Process*.

The Phase II investigation was performed to assess whether contamination of Site soil, soil vapor and groundwater has resulted from issues of concern identified in a Phase I ESA conducted of the Site by Versar in December 2013. Issues of environmental concern that were identified from the Phase I ESA are summarized below:

Versar's Phase I ESA dated December 13, 2013 identified the following issues of concern (LOC). The general area of each of the LOCs is depicted in the Site Layout Map, Figure 2.

- LOC #1 – Shell's Historical Auto Repair Operations and Gasoline Dispensing. Residual total petroleum hydrocarbons (TPH) in groundwater from the removal of the underground storage tanks (USTs) and hydraulic hoists at the Shell station include benzene at 45 micrograms per liter (µg/L), which exceeds the Environmental Screening Level (ESL) for residential use of 27 µg/L. Groundwater impacts from the hydraulic lift location included up to 2,200 µg/L of TPH-gasoline (TPH-g) at the time of case closure. Although both release cases from the Shell station are closed, the residual groundwater impacts above the action level represent a potential vapor encroachment condition (pVEC) and Recognized Environmental Condition (REC) to the Site.

  Also, a clarifier is associated with the Shell station car wash but has not been assessed to date, and also represents a REC.

- LOC #2 – Incomplete Closure for Waste Oil Tank at Shell. In March 1987, a 550-gallon waste oil UST was removed from the south side of the Shell service station and a double-walled waste oil UST was reported to be installed adjacent to the removed waste oil UST. Samples were collected during the 1987 waste oil UST removal; however, no regulatory closeout documentation was identified from the files Versar reviewed. According to the AECOM 2011 Phase I ESA, a double-walled waste oil tank that was installed in 1987 was reportedly removed from the Shell service station in 2006. The absence of close out documentation from the waste oil UST removals (1987 and 2006) presents a REC to the Site

- LOC #3 – Former Montgomery Ward Auto Service Center. At the former Montgomery Ward auto service center (now occupied by Michaels), the waste oil tank on the east side of the former auto center has been closed by the County, but was not assessed for solvents such as chlorinated volatile organic compounds (CVOCs), which are likely to be contained within a waste oil tank since waste oil tanks from automotive operations comprise a variety of materials, including VOCs. Hydraulic lifts were likely present in the

5330 Primrose Drive, Suite 147
Fair Oaks, CA 95628
916.962.1612
www.versar.com

Montgomery Ward auto service center in the 1970s. No record of the removal of the lifts or any of the auto service center materials has been identified. A release of hydraulic fluid from the lifts is reasonably likely, and could contain polychlorinated biphenyls (PCBs). An oil/water separator on the south side of the Michaels building has not been assessed and could present environmental liabilities based on the former auto service usage at this location. The incomplete UST closure and the absence of facility closure data regarding the former hydraulic lifts and oil/water separator represent an REC and pVEC to the Site.

- LOC #4 – Kmart Elevator. A piston-style hydraulic elevator services the two floors of the Kmart building and was installed in the early 1970s. A release of hydraulic fluid from the piston casing is reasonably likely, and could contain PCBs.

- LOC #5 – On and Off-Site Sand/Gravel/Asphalt Operations with Oil Tanks. The historical use of the strip of land that adjoins the Site to the west (east of the Caltrans rail) included sand and gravel operations, an asphalt plant and a truck repair building. Sanborn maps depict multiple oil tanks and other features of concern, a few of which were located on the Site, with the rest adjoining the Site in an up-gradient direction. City of San Mateo Fire Department records indicated that three underground fuel storage tanks were installed at the asphalt plant in 1961. The plant facilities (including four additional above-ground tanks for fuel oil and asphalt) were demolished in 1973 by Concar Enterprises. No information was identified that indicates whether or not the tanks were removed from the site.

- LOC #6 – Off-Site Caltrain Corridor. The Caltrain Corridor (SF to Santa Clara) adjoins portions of the west end of the Site and is reported to contain TPH and metals in soil. TPH in groundwater is likely to occur within the corridor. The Caltrain corridor is within the ASTM Critical Distance of the Site. Based on the corridor location within the Critical Distance of the Site with similar impacts that have been identified at the Site, the Caltrain corridor presents an off-Site REC and pVEC to the Site.

- LOC #7 – Off-Site Vail Burner & Oil Company. Contamination of groundwater by the Vail Burner & Oil Company west of the adjoining Caltrain corridor is documented and has not been defined to the east, toward the Site. Two monitoring wells closest to the Site are impacted by TPH-diesel and CVOCs. The TPH-d and CVOC impacts from this facility have not been defined to the east (toward the Site) and as such, this facility represents an off-Site REC and pVEC to the Site.

SECTION 2.0

BACKGROUND INFORMATION

Versar, Inc. (Versar) has performed a Phase II Environmental Site Assessment (ESA) of the Station Park Green property located in San Mateo, Santa Mateo County, California (Site). The Site location is shown in Figure 1, Site Location Map. The purpose of the Phase II ESA is to investigate locations of concern (LOCs) related to Site operations identified in Versar's Phase I ESA dated December 13, 2013.

The scope of work for this project included collecting soil, soil vapor and groundwater samples from 17 soil and groundwater borings, and 5 soil vapor borings to assess whether contaminants exist at the Site at actionable concentrations. LOCs addressed through this Phase II ESA include historical auto repair, gasoline dispensing operations and apparently incomplete closure of a waste oil tank at the Shell Service Station; assessing a closed waste oil tank at the east side of the former Montgomery Ward Auto Center (now occupied by Michaels Arts & Crafts) for chlorinated Volatile Organic Compounds (VOCs), as well as an assessment of hydraulic lifts and an oil/water separator at this former auto center; assessment of piston-style hydraulic elevators at the Kmart building; and assessing subsurface conditions at the west end of the Site from on and off-Site sand/gravel/asphalt operations with oil tanks; and off-Site releases of Total Petroleum Hydrocarbons (TPH) from the west adjoining Caltrain Corridor and Vail Burner & Oil Company areas.

The approximate boring locations are depicted on Figure 2, Investigation Layout Map.

2.1 Background

The Site is located at 1700, 1750 & 1790 South Delaware Street, San Mateo, San Mateo County, California and is currently developed with a Shell gas station, Michaels and Kmart retail stores and Gazillion Entertainment, an online video game developer. The Site is located in a mixed-use area of San Mateo and is bounded by Concar Street to the southeast, South Delaware Street to the northeast, AAA auto club and the United States Post Office to the north to northwest, and the Hayward Park Caltrain station to the west to southwest. The Site consists of two parcels, assessor's parcel numbers (APNs) 035-200-180 and 035-200-060, totaling approximately 11.4 acres and 0.5-acre, respectively.

2.2 Site Physical Setting

The Site is located in the Santa Clara Valley, which is a structural low associated with the southern end of the San Francisco Bay. Topography of the Site and surrounding area is characterized by relatively flat terrain with a gentle slope eastward to San Francisco bay. According to the United States Geological Survey (USGS) 7.5-minute series topographic map of the San Mateo, California Quadrangle, 1999, the Site is approximately 8 feet above mean sea level (msl). Alluvial deposits are likely to underlie the Site and based on previous investigations conducted, the depth to groundwater is expected to be around 9 – 12 feet below grade surface (bgs). Historical topographic maps suggest the Site comprises made land on former bay marshland.

5330 Primrose Drive, Suite 147
Fair Oaks, CA 95628
916.962.1612
www.versar.com

2.3 Purpose

The purpose of this Phase II ESA is to investigate whether current and historical operations related to various auto repair, gasoline dispensing and storage and handling of hazardous materials at the Site have impacted soil, soil vapor and groundwater.

2.4 Scope of Work

In response to the recognized environmental conditions (RECs) identified in Versar's December 2013 Phase I ESA, and in conformance with the work plan submitted to the San Mateo County Environmental Health Division (SMCEHD); Versar conducted a soil, soil vapor and groundwater investigation of the Site. Prior to initiating the field work, the following limitation was provided by the current owner of the Site, ARJAX II Railroad of San Mateo, California, c/o EBL&S Property Management, Inc. of Philadelphia, Pennsylvania:

- No borings were to be allowed within buildings or within the Shell service station grounds.

To accommodate this limitation, Versar advanced borings around the northern and southwestern perimeter areas of the Shell station and just outside of the Kmart building.

Cascade Drilling, L.P. of Richmond, California performed the drilling services from March 17, 2014 – March 19, 2014. The 17 borings for soil/groundwater sample collection were hand augered down to five feet bgs for safety purposes; five subsequent soil vapor borings were not hand-augered to five feet bgs.

The tasks completed are listed below. Boring locations are depicted in Figures 3 through 6.

2.4.1 Soil, Soil Vapor and Groundwater Investigation

LOCs #1 and 2 – Shell's Historical Auto Repair Operations and Gasoline Dispensing

Using direct push technology (DPT), Versar assessed the features of interest of LOC #1 by advancing three borings – one north of the car wash clarifier (Boring B1) and two borings (B2 & B3) in the waste oil and former waste oil tank area to address LOCs #1 and #2. Soil vapor samples (SV-1 – SV-3) were also collected around the perimeter of the Shell station. The wells were installed in the shallow subsurface to a depth of 5 feet bgs. Boring B2 was advanced near the former waste oil tank location to a depth of 10 feet bgs with soil samples collected at 7 and 10 feet bgs. Borings B1 and B3 were advanced to groundwater (12 and 18 feet, respectively) and temporary wells were installed at 20 feet bgs.

For the waste oil tank borings, since the contents from the tank are unknown, Versar followed sample requirements for the Regional Water Quality Control Board (RWQCB), Central Valley Region "Tri-Regional Board Staff Recommendations for Preliminary Investigation and Evaluation of Underground Storage Tank Sites, Appendix A, Table #2 – Recommended Minimum Verification Analyses for Underground Storage Tank Investigations." This included TPH-g and TPH-d by EPA Method 8015M; VOCs by Method 8260B plus the fuel oxygenates methyl-tertiary butyl ether (MtBE), diisopropyl ether (DIPE), ethyl-tertiary butyl ether (EtBE), tertiary-amyl-methyl ether (TAME), tertiary-butanol (TBA), methanol, ethanol and fuel additives

5330 Primrose Drive, Suite 147
Fair Oaks, CA 95628
916.962.1612
www.versar.com

1,2-dichloroethane (1,2-DCA) and ethylene dibromide (EDB or 1,2-dibromoethane); Semi-Volatile Organic Compounds (SVOC) by Method 8270; Oil and Grease by Method 1664A; Polychlorinated Biphenyls (PCBs) by Method 8082; and California Title 22 Metals by Method 6010B, 7000 Series.

The soil vapor samples were analyzed for TPH-g, benzene, toluene, ethylbenzene and toluene (BTEX) by EPA Method TO-15. Soil gas samples were collected in general accordance with Appendix G of the *Final Guidance for the Evaluation and Mitigation of Subsurface Vapor Intrusion to Indoor Air, California Department of Toxic Substances Control, California EPA, October 2011.*

Groundwater samples were analyzed for VOCs by Environmental Protection Agency (EPA) Method 8260, Leaking Underground Fuel Tank (LUFT) Metals consisting of cadmium, chromium, nickel, lead and zinc by EPA Method 6020, pH by EPA Method 9045, and TPH in the diesel (-d) and motor oil (-mo) ranges by EPA Method 8015M.

Versar collected a total of four soil samples, three soil vapor samples and two grab groundwater samples from the three locations at LOCs #1 and #2.

LOC #3 – Former Montgomery Ward Auto Service Center

Versar assessed three features at the former auto service center building: a former waste oil tank at the east end of the building, the former hydraulic lifts inside the building and the oil/water separator located south of the existing Michaels building. Since Versar was not allowed access inside the building, boring B4 was advanced at the southeastern exterior portion of the building, a location most proximal to the interior hydraulic lifts. The boring was advanced to groundwater at 25 feet bgs and a temporary well was installed. One soil sample was collected from B4 at a depth of 4.5 feet bgs.

The soil and grab groundwater samples were analyzed for VOCs, LUFT Metals, pH, TPH in the diesel (-d) and motor oil (-mo) ranges and PCBs.

To assess the former waste oil tank, Versar followed the same scope as with the Shell waste oil tank and utilized the data collected from boring/temporary well B3 to assess if a substantive release had occurred.

At the oil/water separator location, Borings B5 and B6 were advanced at each end of the separator to groundwater and a temporary well was installed to 20 feet bgs, with soil samples collected at 2.5 and 5 feet bgs. The deeper soil samples were held pending the analysis of the shallower soil samples. One grab-groundwater sample was collected from the temporary well point at each boring.

The soil and groundwater samples were analyzed for full range TPH(gas, diesel and motor oil), VOCs and LUFT Metals.

Versar collected a total of five soil samples and three grab groundwater samples from the three borings at LOC #3.

5330 Primrose Drive, Suite 147
Fair Oaks, CA 95628
916.962.1612
www.versar.com

LOC #4 – Kmart Elevator

Due to access restriction, soil and groundwater directly adjacent to the elevator could not be collected. Instead, Versar collected grab-groundwater samples from three borings (B7 – B9) at locations outside the building in the likely direction of groundwater flow, which ranges from north to easterly. One grab-groundwater sample was collected from each temporary well point installed at 20 feet bgs. Versar collected a total of 3 grab groundwater samples from LOC #4.

The groundwater samples were analyzed for TPH-hydraulic fluid (TPH-hf) and PCBs.

LOC's #5, 6 and 7 – On and Off-Site Sand/Gravel/Asphalt Operations with Oil Tanks

Historical maps depicted several features of potential environmental concern that were previously located along the western boundary of the Site, extending westward to off-Site properties.

To assess groundwater conditions regarding an off-Site TPH release in groundwater from the Vail Burner & Oil facility (LOC #7), as well as a reported TPH and metals release in soil from the west adjoining Caltrain Corridor (LOC #6), Versar advanced three borings (B10 - B12) along the western property boundary (west of the Kmart building) and collected three grab groundwater samples from temporary wells installed at 20 feet bgs. Versar also collected two soil samples per boring from borings B10 and B11. Soil samples collected from B10 were from depths of one and five feet bgs, and samples collected from B11 were from 1.5 and eight feet bgs.

The three groundwater samples were analyzed for VOCs, full range TPH and LUFT Metals; the sample next to the generator station (B11) was also analyzed for PCBs.

To assess former operations at the western end of the Site, which included an asphalt plant, electrical generator station, a truck repair building and oil tanks (LOC #5), Versar advanced five borings (B13 – B17) to a depth of 5.5 feet bgs, with soil samples collected at 2.5 and five feet bgs at each boring. The deeper soil samples were held pending the analysis of the shallower soil samples. Borings B13, B14 and B15 were advanced in representative locations to assess general soil conditions in suspect areas along the southwestern exterior of the Kmart building. Boring B16 was advanced in the approximate location of the former asphalt heating plant. Boring B17 was advanced proximal to the former electrical generator station.

Borings B13 – B15 were analyzed for full range TPH and LUFT Metals. Boring B16 was analyzed for full range TPH and boring B17 was analyzed for TPH-d, -mo and PCBs.

Versar assessed soil vapor conditions around the western property boundary for VOCs entering the Site in groundwater by installing two temporary soil vapor wells, SV-4 and SV-5. The vapor wells were installed in the shallow subsurface to a depth of five feet bgs. Versar collected one soil vapor sample from each temporary sampling point. The soil vapor samples were analyzed for VOCs by EPA Method TO-15.

Boring logs are included in Appendix A.

www.versar.com

SECTION 3.0

FIELD INVESTIGATION

3.1 Permitting

A boring permit for each APN was obtained from the SMCEHD. A copy of each permit is provided in Appendix B.

3.2 Utility Clearance

Utility clearance for the Site comprised marking the investigation area, notifying Underground Service Alert (USA) (Ticket #0093795), and performing a private utility search on March 13, 2014. Underground utilities within public rights of way were identified and marked by USA. Specific boring locations within the property were cleared by a private utility locator. No utilities were encountered during the investigation.

3.3 Project Health and Safety

Versar prepared a Site-specific health and safety plan (HSP) prior to performing the field investigation. A Site Safety Officer (SSO) was designated during the field investigation. The SSO was responsible for adherence to the HSP and was present during all field activities. The HSP was presented, reviewed and signed by field personnel. The HSP field documentation is provided in Appendix C.

3.4 Decontamination Procedures

Down-hole equipment including drilling rods, bits and sampling equipment was thoroughly cleaned before and after the drilling of each borehole. Equipment was cleaned with water and laboratory-grade, non-phosphate surfactant, and double rinsed, or high-pressure washed. Wastewater generated during this process was stored on Site in appropriate containers pending disposal. Clean, disposable gloves were worn by all field personnel when handling decontaminated equipment.

3.5 Field Screening

Soil samples were field screened using a Photo-Ionization Detector (PID). The PID was calibrated before use in the field. The calibration was performed using a reference gas of 100 parts per million (ppm) isobutylene, which is the standard for fuel hydrocarbon screening. The PID utilized a 10.6 eV lamp which provides the most direct reading of fuel hydrocarbons and related aromatics.

The results of PID field screening, as well as visual indicators of contamination such as staining, sheen, and product presence as encountered, were used in selecting soil samples for laboratory analysis, and were documented on boring logs, presented in Appendix B.

5330 Primrose Drive, Suite 147
Fair Oaks, CA 95628
916.962.1612
www.versar.com

3.6 Field Activities

Field activities were performed from March 17 to March 19, 2014 and comprised 22 borings within the boundaries of the Site; and collecting soil, groundwater and soil vapor samples for laboratory analysis. Table 1 summarizes the sample locations and analytical tests for each location.

3.6.1 Soil Borings

Most of the soil borings were advanced by first using the drill rig to bore asphalt paving. All soil borings for soil and groundwater sampling used hand augering to advance the boring to between five feet bgs and five and a half feet bgs. Borings B-13 through B-17 were advanced and sampled using only hand augering after boring the asphalt pavement.

For borings advanced deeper than five feet bgs, the remainder of the boring was advanced with a direct-push drill rig. Borings B-1, B-3, B-5, B-6, B-7, B-8, B-9, B-10 and B-11 were advanced from five feet bgs to 20 feet bgs with a direct push drill rig using dual-tube tooling; a temporary well casing was installed in each boring, and a grab groundwater sample was collected. In addition to the grab groundwater samples, two soil samples per boring were collected from borings B-1, B-5, B-6, B-10 and B-11.

Boring B-2 was advanced from five feet bgs to 10.5' bgs with a direct-push drill rig using dual-tube tooling; two soil samples were collected.

Boring B-4 was advanced from five feet bgs to 25 feet bgs with a direct-push drill rig; temporary well casing was installed and a grab-groundwater sample was collected.

For boring B-12, a Hydropunch was advanced to 20 feet bgs with a direct-push drill rig and a grab-groundwater sample collected. Hydropunch tooling was used to avoid contamination of the sample with perched water encountered at four feet bgs.

For soil vapor borings SV-1 through SV-5, hand augering was not performed; the boring was advanced from grade surface to five feet bgs with a direct-push drill rig. In boring SV-1, a tight soil was encountered; the soil vapor probe was withdrawn from five feet bgs to four feet bgs to facilitate sampling.

Locations of the soil samples are shown on Figures 2 through 6. Borings were extended to depths ranging between 5.5 and 25 feet bgs. A drilling log was created for each boring describing the soil profile, sample collection locations, field observations and PID readings. The boring logs are presented in Appendix A.

Each soil boring was abandoned by filling with neat cement containing up to five percent powdered bentonite, as required by the permit. Borings in which groundwater was encountered were filled using a Tremie pipe. Borings were filled to the surface, allowed to settle and topped off. Soil cuttings and decontamination water were contained in 55-gallon Department of Transportation (DOT)-approved drums for later disposal. The drums were labeled as non-hazardous waste with appropriate information including the contents and date of collection. The waste-containing drums were stored in a secure location on Site until removal and disposal based on their waste characteristics.

5330 Primrose Drive, Suite 147
Fair Oaks, CA 95628
916.962.1612
www.versar.com

3.6.2 Soil Sampling

Two soil samples per boring were collected from borings B-1, B-2, B-5, B-6, B-10, B-11, B-13, B-14, B-15, B-16 and B-17. One soil sample was collected from boring B-4. A total of 23 soil samples were collected. Soil samples were collected at predetermined depths, or when field observation of odor, unusual soil color or staining indicated potential contamination. All soil samples were screened using a photoionization detector prior to collection.

Samples collected by hand-augering were retained in stainless steel sleeves, with exposed sleeve ends covered with Teflon sheeting and each end capped with a pressure-fitted plastic cap. Samples collected by direct push were retained within the acetate liner of the direct push sample barrel. Samples cut from the liner were sealed, with exposed liner ends covered with Teflon sheeting and each end capped with a pressure-fitted rubber cap. The samples were separately contained in new, re-sealable plastic bags placed on ice in a cooler prior to transferring custody to the contract laboratory. All samples were handled following chain-of-custody protocols from collection through analysis.

3.6.3 Groundwater Sampling

Grab groundwater samples were collected from boring B-1 and borings B-3 through B-12, throughout the Site. Once groundwater was encountered, a 0.020-slotted polyvinyl chloride (PVC) pipe was inserted into the boring to allow continued access to the water-bearing unit. Well screens were set at 25 feet bgs in boring B-4 and 20 feet bgs in the remaining borings. Dual-tube tooling was used to advance all grab-groundwater borings with the exception of boring B-12, which was advanced via Hydropunch. Grab-groundwater samples were collected by gently lowering a pre-cleaned, polyethylene bailer into the groundwater, recovering the water-filled bailer and carefully decanting the sample into the appropriate sample container, with preservative as appropriate. Metals samples were not preserved in the field, and were laboratory-filtered before analysis.

3.6.4 Soil Vapor Sampling

The soil vapor survey was performed in accordance with the California EPA, Department of Toxic Substances Control (DTSC), *Guidance for the Evaluation and Mitigation of Subsurface Vapor Intrusion to Indoor Air (Vapor Intrusion Guidance)* (DTSC October 2011), except where otherwise noted. Soil vapor points were advanced to five feet bgs using a direct-push drill rig. Post-Run Tubing (PRT) soil vapor sampling equipment was used. Each soil vapor sampling point was allowed to equilibrate for two hours or more after completion before a sample was collected into a 1-liter certified-clean Summa canister. At point SV-1, the soil formation at five feet bgs was too tight to permit sampling; the probe was withdrawn to four feet bgs, and sampling was conducted successfully.

All soil vapor probes were constructed with a new stainless steel Post-Run Tubing drive point and adapter connected to new 0.25-inch Teflon tubing to the surface. Soil vapor probes were set in clean sand 3-4 inches above the final depth of the boring. A bentonite seal was installed at the surface of the boring.

Prior to purging or sampling soil gas, a shut-in-test was conducted to check for leaks in the above-ground fittings. The shut-in test consisted of assembling the above-ground manifold and tubing and applying a vacuum, then shutting the vacuum in with closed valves on opposite ends

5330 Primrose Drive, Suite 147
Fair Oaks, CA 95628
916.962.1612
www.versar.com

of the sampling train. The vacuum gauge was observed for at least three minutes and if there was observable loss of vacuum, the fittings were adjusted as needed until the vacuum the sample train did not noticeably dissipate. If adjustments to the fittings did not stop the loss, the manifold would be traded out and a new shut-in test conducted.

Each of the vapor wells was purged of three well volumes, calculated using the volume of the Post-Run Tubing system and blank casing, at the same rate as the sample collection, 150 ml/min. Prior to sample collection, the well and entire sampling train was placed under a shroud constructed of 2 mil plastic. Isopropyl alcohol (IPA) was applied to a cloth and placed in the sampling shroud to serve as a leak trace compound to document collection system integrity. Soil vapor sampling data sheets were prepared during the sampling and are included as Appendix E. The samples were then delivered to Sunstar Laboratories Inc., ELAP #2250 and analyzed for TPH-g and BTEX (SV-1 through SV-3) or VOCs (SV-4 and SV-5), and isopropyl alcohol (used for leak detection) by EPA Method TO-15.

3.7 Storage and Disposal of Wastes

Wastes collected during the investigation comprised soil cuttings. All collected wastes were placed into a 55-gallon, DOT -approved drum and stored at the Site pending disposal. The wastes collected and stored at the Site comprised one drum of soil. The contents of the drum and the date of collection were clearly marked on an appropriate label.

SECTION 4.0

LABORATORY ANALYSIS

Selected soil, soil vapor and groundwater samples were submitted to a California state-certified laboratory for chemical analyses: SunStar Laboratories, Inc. (SunStar), (Environmental Laboratory Accreditation Program [ELAP] Certificate No. 2250). Samples were analyzed within instrument and accuracy limits defined by the method. The samples were collected, placed in containers, preserved and analyzed within the time constraints consistent with applicable USEPA, California EPA, and industry practices. Samples were delivered under Versar's chain-of-custody protocol; custody of the samples began at the time of sample collection and was maintained by the sampling team until the samples were relinquished to the laboratory.

Soil samples were analyzed as follows:

TABLE 1:
LABORATORY ANALYSIS FOR EACH SAMPLE LOCATION

Sample	Matrix	Analyses

SECTION 5.0

INVESTIGATIVE FINDINGS

The findings of this monitoring event are presented in the following sections. Tabulated analytical results are presented in Tables 2 through 4. The laboratory analytical report and chain-of-custody documentation are included in Appendix D. Regulatory screening criteria used were the San Francisco Regional Water Quality Control Board Environmental Screening Levels (SF RWQCB ESLs – Residential, December 2013), California Human Health Screening Levels (CHHSLs – 2010) and U.S. EPA Region 9 ESLs (November, 2013). Sample results were compared to residential cleanup criteria.

5.1 Soil Samples

TPH Analysis

Gasoline-range hydrocarbons were detected in the soil sample collected from the B16 boring (Sand/Gravel/Asphalt Plant) at a depth of 2.5 feet bgs, at a concentration of 0.63 milligrams per kilogram (mg/kg). This concentration did not exceed the SFRWQCB ESL for TPH-g of 100 mg/kg. The deeper soil sample collected at 5 feet bgs was non-detect (<0.5 mg/kg) for TPH-g.

Diesel-range hydrocarbons were detected in six samples at concentrations ranging from 75 mg/kg to 530 mg/kg. The SFRWQCB ESL for TPH-d of 100 mg/kg was exceeded at four locations. The first was at the former Montgomery Ward auto repair hydraulic lift boring B4 with a concentration of 120 mg/kg at a depth of 4.5 feet bgs. The second was at the boring B6 (Montgomery Ward Oil/Water Separator) with a concentration of 340 mg/kg at a depth of 2.5 feet bgs; the deeper sample collected at 5 feet bgs was non-detect (<10 mg/kg). The third exceedance was at boring B15 (Sand/Gravel/Asphalt Plant) with a concentration of 370 mg/kg at a depth of 2.5 feet bgs; the deeper sample collected at five feet bgs was non-detect (<10 mg/kg). The fourth exceedance was at boring B16 (Sand/Gravel/Asphalt Plant) with a concentration of 530 mg/kg at a depth of 2.5 feet bgs; the deeper sample collected at five feet bgs was non-detect (<10 mg/kg).

Concentrations of TPH-d below action levels were detected in samples collected from borings B5 and B13, borings associated with the Montgomery Ward Oil/Water Separator and Sand/Gravel/Asphalt Plant, with concentrations ranging from 75 to 85 mg/kg.

Motor oil-range hydrocarbons were detected in nine soil samples at concentrations ranging from 18 to 4,700 mg/kg. The SFRWQCB ESL for TPH-mo of 100 mg/kg (Residential) was exceeded in six locations. The first was at boring B4 (Montgomery Ward Hydraulic Lifts) with a concentration of 500 mg/kg at a depth of 4.5 feet bgs. The second was at boring B5 (Oil/Water Separator) with a concentration of 790 mg/kg at a depth of 2.5 feet bgs; the deeper sample collected at five feet bgs was non-detect (<10 mg/kg). The third location was also at the Oil/Water separator location, boring B6, with a concentration of 4,700 mg/kg at a depth of 2.5 feet bgs; the deeper sample collected at five feet bgs was non-detect (<10 mg/kg). The fourth exceedance was at boring B13 (Sand/Gravel/Asphalt Plant) with a concentration of 550 mg/kg; the deeper sample collected at five feet bgs was non-detect (<10 mg/kg). The fifth location was at boring B15 (Sand/Gravel/Asphalt Plant) with a concentration of 2,200 mg/kg; the deeper sample collected at five feet bgs had a concentration of 38 mg/kg; below the ESL. The last

5330 Primrose Drive, Suite 147
Fair Oaks, CA 95628
916.962.1612
www.versar.com

location was at boring B16 (Sand/Gravel/Asphalt Plant) with a concentration of 710 mg/kg; the deeper sample collected at five feet bgs was non-detect (<10 mg/kg).

Concentrations of TPH-mo below action levels were also detected in shallow soil samples collected from boring B11 (Vail/Burner Oil/Caltrain Off-Site Release) and boring B14 (Sand/Gravel/Asphalt Plant), with concentrations ranging from 18 to 49 mg/kg.

VOC Analysis

No VOCs were detected at or above laboratory reporting limits in soil samples collected from borings B1 – B11.

SVOC Analysis

No SVOCs were detected at or above laboratory reporting limits from the soil sample collected from boring B2, the only soil sample analyzed for SVOCs.

PCB Analysis

PCB-1254 was detected above the laboratory reporting limit in the soil sample collected at boring B4 (Montgomery Ward Hydraulic Lifts) with a concentration of 0.065 mg/kg at a depth of 4.5 feet bgs; this concentration is below the applicable ESL of 0.22 mg/kg.

Metals Analysis

Barium, chromium, cobalt, copper, lead, nickel, vanadium and zinc were detected in soil samples. Barium concentrations ranged from 16 mg/kg to 65 mg/kg; chromium concentrations ranged from 7.5 mg/kg to 36 mg/kg; cobalt concentrations ranged from 6.5 mg/kg to 9.5 mg/kg; copper concentrations ranged from 12 mg/kg to 14 mg/kg; lead concentrations ranged from 4.1 mg/kg to 340 mg/kg; nickel concentrations ranged from 5.8 mg/kg to 51 mg/kg; vanadium concentrations ranged from 26 mg/kg to 32 mg/kg and zinc concentrations ranged from 26 mg/kg to 350 mg/kg.

Arsenic, cadmium, mercury, selenium and silver were not detected above reporting limits in any soil samples.

Detected concentrations of barium, chromium, cobalt, copper, nickel, vanadium and zinc were below their respective SFRWQCB ESLs.

A lead concentration of 340 mg/kg at the boring B4 location (Montgomery Ward Hydraulic Lifts) exceeded the SFRWQCB ESL of 80 mg/kg. The sample depth was 4.5 feet bgs.

pH Analysis

Soil sample pH values ranged from 7.8 to 8.3 at the boring B1 location (Shell Car Wash Clarifier). These concentrations are within acceptable limits as corrosive waste is defined as having a pH equal to or less than 2.0 or greater than or equal to 12.5 pH.

The analytical results for TPH, VOCs, SVOC, PCB, Metals and pH were compared to the SFRWQCB ESLs and are presented in Table 2 of this report. Figures 3 and 6 illustrate the detected concentrations of analytes in soil samples that exceed applicable screening levels.

www.versar.com

5.2 Groundwater Samples

TPH Analysis

Actionable concentrations of TPH were identified in groundwater samples collected at the southwestern portion of the Site at boring B12 (Vail Burner Oil/Caltrain Off-Site Release) and from the Montgomery Ward Oil/Water Separator boring B6. The B12 location included a TPH-g concentration of 19,000 micrograms per liter (µg/L), a TPH-d concentration of 120,000 µg/L and a TPH-mo concentration of 8,700 µg/L. All three concentrations exceeded the SFRWQCB ESL of 100 µg/L for the relevant TPH ranges. The B6 location had a TPH-d concentration of 170 µg/L.

No other actionable concentrations of TPH were identified in groundwater samples. TPH-hydraulic fluid was not identified at concentrations at or above laboratory reporting limits in samples collected from borings B7 – B9.

VOC Analysis

Actionable concentrations of 1,2-Dichloroethane (1,2-DCA) and Methylene chloride were identified in groundwater samples collected around the Shell Station at borings B1 and B3, respectively. At the boring B1 location (Shell Car Wash Clarifier), a 1,2-DCA concentration of 18 µg/L exceeded the ESL of 0.5 µg/L. At the boring B3 location (Shell Waste Oil Tank), a Methylene chloride concentration of 31µg/L exceeded the ESL of 5 µg/L.

Concentrations of VOCs below action levels included Isopropylbenzene (3.6 µg/L), Napthalene (5.5 µg/L) and n-Propylbenzene (6.0 µg/L) at the boring B1 location (Shell Car Wash Clarifier). At the boring B3 location (Shell Waste Oil Tank), Bromochloromethane (3.7 µg/L), Bromodichloromethane (2.7 µg/L), Chloroform (14 µg/L) and Dibromomethane (1.2 µg/L) were identified. A Chloroform concentration of 4.6 µg/L was identified at boring B4 (Montgomery Ward Hydraulic Lifts). At the boring B6 location (Montgomery Ward Oil/Water Separator), low concentrations of cis-1,2-Dichloroethene (4.0 µg/L) and Trichloroethene (1.1 µg/L) were identified.

BTEX Analysis

An actionable concentration of benzene was identified in the groundwater sample collected at boring B1 (Shell Car Wash Clarifier) with a concentration of 640 µg/L, exceeding the ESL for benzene of 1 µg/L.

The boring B1 location also had low concentrations of Toluene (2.4 µg/L), Ethylbenzene (4.6 µg/L) and Xylenes (1.2 µg/L) which were below their ESLs of 40 µg/L, 30 µg/L and 20 µg/L, respectively.

Benzene was detected at 1 µg/L in the groundwater sample collected at boring B4 (Montgomery Ward Hydraulic Lifts); this concentration is equal to the benzene ESL of 1 µg/L.

PCB Analysis

No PCBs were detected at or above laboratory reporting limits in 4 groundwater samples collected from borings B7 – B9 and B11.

5330 Primrose Drive, Suite 147
Fair Oaks, CA 95628
916.962.1612
www.versar.com

Metals Analysis

Actionable concentrations of the metals nickel, lead and cadmium were identified. Nickel exceeded the ESL aquatic habitat goal of 8.2 µg/L in seven borings with concentrations ranging from 11 µg/L to 1,700 µg/L. This included borings B1 (Shell Car Wash Clarifier) with a concentration of 120 µg/L; boring B3 (Shell Waste Oil Tank) with a concentration of 1,700 µg/L; borings B5 and B6 (Montgomery Ward Oil/Water Separator) with respective concentrations of 11 and 13 µg/L; and borings B10 – B12 (Vail Burner Oil/Caltrain Off-Site Release) with a concentrations of 430 µg/L at boring B10, 280 µg/L at boring B11 and 52 µg/L at boring B12. The California drinking water goal for nickel of 100 ug/L was exceeded at borings B1, B3, B10 and B11.

Lead exceeded the aquatic habitat and drinking water ESL of 2.5 µg/L and 15 ug/L at boring B3 (Shell Waste Oil Tank) with a concentration of 20 µg/L.

Cadmium exceeded the aquatic habitat ESL of 0.25 µg/L at boring B10 (Vail Burner Oil/Caltrain Off-Site Release) with a concentration of 3.9 µg/L.

The metals chromium and zinc were not identified in the collected groundwater samples.

pH Analysis

pH in groundwater at borings B1 (Shell Car Wash Clarifier) and B3 (Shell Waste Oil Tank) ranged from 5.8 to 6.9; within acceptable parameters.

5.3 Soil Vapor Samples

An actionable concentration of benzene was detected at soil vapor point SV-1 (Shell Car Wash Clarifier) at 4 feet bgs with a concentration of 53 micrograms per cubic meter (µg/m^3), above the SFRWQCB Table E-2 ESL for shallow soil gas screening levels for evaluation of potential vapor intrusion for residential criteria of 42 µg/m^3.

Benzene at concentrations below the action level was identified at vapor points SV-3 (Shell Waste Oil Tank) with a concentration of 3.4 µg/m^3; and at SV-4 and SV-5 (Vail Burner Oil/Caltrain Off-Site Release) with detections of 3.3 µg/m^3 and 6.2 µg/m^3, respectively. Low concentrations of toluene were identified at soil vapor points SV-1 (Shell Car Wash Clarifier) and SV-5 (Vail Burner Oil/Caltrain Off-Site Release) with concentrations of 5.7 µg/m^3 and 5.8 µg/m3, respectively. VOCs carbon disulfide (6.4 µg/m^3), heptane (9.7 µg/m^3) and hexane (4.8 µg/m^3) were identified at SV-4 (Vail Burner Oil/Caltrain Off-Site Release). No regulatory action levels have been established for these VOCs. Trichloroethene (TCE) was identified at vapor point SV-5 (Vail Burner Oil/Caltrain Off-Site Release) with a concentration of 79 (µg/m^3), below the action level of 300 µg/m^3. Vapor point SV-5 also had heptane and hexane concentrations of 17 and 15 µg/m^3, respectively.

No other compounds of concern were detected in the soil vapor samples collected.

SECTION 6.0
CONCLUSIONS AND RECOMMENDATIONS

Versar, Inc. (Versar) has performed a Phase II Environmental Site Assessment (ESA) of the Station Park Green property located 1700, 1750 and 1790 S. Delaware Street in San Mateo, San Mateo County, California (Site). This report has been prepared to conform to the scope and limitations of the American Society for Testing and Materials Standard Practice E1903-97, *Standard Guide for Environmental Site Assessments: Phase II Environmental Site Assessment Process*.

The results of the Phase II investigation has identified several locations where concentrations of contaminants of concern in soil, soil vapor and groundwater exceed applicable action levels (SFRWQCB ESLs).

At the north side of the Shell station, actionable concentrations in groundwater of benzene (640 µg/L), nickel (up to 1,700 µg/L) methylene chloride, 1,2-DCA and lead were identified in samples collected from borings advanced next to a car wash clarifier and a former waste oil tank (borings B1 and B3). Benzene in soil vapor near the car wash clarifier also exceeded the action level. The high levels of benzene and nickel indicate an apparent release from one or more of the Shell service station features. Versar recommends further definition of the benzene, nickel and VOC impacts in the Shell station area.

An apparent release of TPH in the oil and diesel range has impacted mostly soil at the south side of the Michael's (former auto service) building. Borings in this location were advanced to assess an oil/water separator, waste oil tank and interior hydraulic lifts. Lead was also actionable in soil and a detection of PCBs (0.065 mg/kg) at 4.5 feet bgs was identified at a concentration below the action level. TPH-d in groundwater (170 µg/L) was slightly above the action level of 100 µg/L. Soil at the oil/water separator location (B5 and B6) was vertically delineated; indicating the TPH impacts are likely localized to the shallow soil profile. Versar recommends horizontal and vertical delineation of the TPH, lead and PCB impacts at the B4 location, and removal and appropriate disposal of impacted soil from the area delineated by borings B4 – B6. Evidence of groundwater impact was noted, but could not be adequately assessed due to boring location constraints imposed by the Site owner.

A perched layer of groundwater at the southwestern corner of the Site (B12) had elevated gas (19,000 µg/L), diesel (120,000 µg/L) and oil (8,700 µg/L)-range petroleum hydrocarbons. Evidence of free product was noted in the boring.

Nickel in groundwater was actionable at seven locations throughout the Site with concentrations ranging from 11 to 1,700 µg/L. This included 3 locations at the southwestern side of the Site with concentrations ranging from 52 to 430 µg/L. Cadmium in groundwater was also actionable at B10 (3.9 µg/L). The highest concentration of nickel at the north end of the Shell station (1,700 µg/L) appears to be localized as the other locations around the Shell and Michaels properties had lesser concentrations, ranging from 11 to 120 µg/L. While actionable concentrations of nickel were not identified on Site, elevated concentrations are expected in areas of elevated groundwater concentrations.

Shallow soil impacts of gas, diesel and oil were identified at three locations at the southwestern side of the Site (B13, B15 and B16). Deeper soil samples collected in this area did not identify

5330 Primrose Drive, Suite 147
Fair Oaks, CA 95628
916.962.1612
www.versar.com

actionable TPH, indicating the TPH impacts are likely localized to the shallow soil profile. Versar recommends horizontal delineation of the TPH impacts and removal and appropriate disposal of impacted soil, which may be performed during Site grading activities prior to redevelopment construction.

The metals barium, chromium, cobalt, copper, lead, nickel, vanadium and zinc were detected at consistent concentrations in most soil samples tested for those metals. The detected concentrations are below applicable action levels, or within naturally-occurring background ranges for Santa Clara County.

STATEMENT OF LIMITATIONS

The data presented and the opinions expressed in this report are qualified as follows:

- The sole purpose of the investigation and of this report is to assess the physical characteristics of the Site with respect to the presence or absence of oil or hazardous materials and substances in the environment as defined in the applicable state and federal environmental laws and regulations and to gather information regarding current and past environmental conditions at the Site.

- Versar derived the data in this report primarily from visual inspections, examination of records in the public domain, and interviews with individuals with information about the Site. The passage of time, manifestation of latent conditions, or occurrence of future events may require further exploration at the Site, analysis of the data, and reevaluation of the findings, observations, conclusions, and recommendations expressed in the report.

- In preparing this report, Versar has relied upon and presumed accurate certain information (or the absence thereof) about the Site and adjacent properties provided by governmental officials and agencies, the Client, and others identified herein. Except as otherwise stated in the report, Versar has not attempted to verify the accuracy or completeness of such information.

- The data reported and the findings, observations, conclusions, and recommendations expressed in the report are limited by the Scope of Services. The Scope of Services was defined by the requests of the Client, and the availability of access to the Site.

- The findings, observations, conclusions, and recommendations expressed by Versar in this report are limited to the information obtained and should not be considered an opinion concerning the compliance of any past or current owner or operator of the Site with any federal, state, or local law or regulation. No warranty or guarantee, whether expressed or implied is made with respect to the data reported or findings, observations, conclusions, and recommendations expressed in this report. Further, such data, findings, observations, conclusions, and recommendations are based solely upon Site conditions in existence at the time of investigation.

- This report has been prepared on behalf of the Client, and is subject to and issued in connection with the Agreement and the provisions thereof.

HEALTH & SAFETY PLAN DOCUMENTATION

8.0 DOCUMENTATION

8.1 Site Safety Plan Agreement

In the situation that contamination is encountered which could come into contact with site development personnel, all details of this site safety plan will be implemented. Versar personnel have the authority to stop work performed by our subcontractors at this site if any work is not performed in accordance with the requirements of this site safety plan.

All Versar project personnel and subcontractor personnel are required to sign the following agreement prior to conducting work at the site.

A. I have read and fully understand the site safety plan and my individual responsibilities.

B. I agree to abide by the provisions of the site safety plan.

Versar -- Fair Oaks	Project: Station Park Green	
5330 Primrose Dr. #147	Project Number: 105071.0053.002	**Reported:**
Fair Oaks CA, 95628	Project Manager: Tim Berger	04/11/14 12:40

Notes and Definitions

S-LOW	Low surrogate recovery confirmed as a matrix effect by a second analysis.
S-GC	Surrogate recovery outside of established control limits. The data was accepted based on valid recovery of the remaining surrogate(s).
R-01	The Reporting Limit has been raised to account for dilution necessary due to matrix interference.
QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to possible matrix interference. The LCS was within acceptance criteria. The data is acceptable as no negative impact on data is expected.
O-05	This sample was extracted outside of the EPA recommended holding time.
MS-02	The RPD and/or percent recovery for this QC spike sample cannot be accurately calculated due to the high concentration of analyte inherent in the sample.
M-04	Due to the nature of matrix interferences, sample extract was diluted prior to analysis. The MDL and MRL were raised due to the dilution.
I-02	This result was analyzed outside of the EPA recommended holding time.
D-12	Results in the Gasoline Range are primarily due to overlap from a heavier fuel hydrocarbon product.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

To: Charles Ice, San Mateo County GPP

From: ENVIRON

Re: Environment Sampling at 470 Concar Drive and 1830 South Delaware Street

This memo summarizes soil and groundwater sampling performed in 2013 and 2014 by ENVIRON on behalf of Hines at the adjacent parcels 470 Concar Drive and 1830 South Delaware Street in San Mateo (the "Site"). Previous sampling performed in 2008 was described in a memo to you dated May 20, 2008, which is included in this memo as Attachment 1. At that time, the San Mateo GPP decided not to open a case.

Hines is planning to demolish the existing commercial buildings on the Site and build a new office building complex with underground parking. The current construction plans call for soil excavation to a depth of 18-22 feet. The City of San Mateo has required that Hines notify and consult with the County Health Services Agency prior to the start of grading on the Site.

As described in detail below, recent groundwater sampling indicates that concentrations have decreased since 2008 and are now below environmental screening levels. Recent soil sampling has indicated that the soils to be excavated do not exceed federal or state hazardous waste criteria. After reviewing this information, please provide written confirmation that no further action is required by GPP. This confirmation will be provided to the City in order to satisfy the requirement for consultation with the County Health Services Agency.

Groundwater Sampling

In September 2013, ENVIRON collected groundwater samples from the five existing piezometers at the Site to determine current concentrations of volatile organic compounds (VOCs) in shallow groundwater, which is first encountered at a depth of 3-8 ft below ground surface . The existing piezometers were installed in 2000 for geotechnical purposes by Bay Area Geotechnical Group. The sampling results are shown in Figure 1 and key findings are summarized below.

- All concentrations were below Regional Water Quality Control Board (RWQCB) Environmental Screening Levels (ESLs) for groundwater not being used as a drinking water source.
- Concentrations were generally lower than those measured in 2008.
- During the 2013 investigation, 1,2-dichloroethane (1,2-DCA) was detected at only one location at a concentration of 0.57 µg/L, as compared to a maximum concentration of 920 µg/L found in the 2008 investigation.

Soil Sampling

In November 2014, ENVIRON conducted pre-excavation soil sampling to assess whether soil to be excavated may be classified as a hazardous waste under California or federal regulations. Based on current construction plans, planned soil excavation volumes are approximately 62,000 cubic yards for the 1830 S. Delaware parcel and 24,000 cubic yards for the 470 Concar parcel. Consistent with the California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC's) "Recommended Fill Material Sampling Schedule" as detailed in *Information Advisory* –

Clean Imported Fill Material (DTSC 2001), ENVIRON collected depth-discrete composite soil samples from 68 locations at the Site to obtain analytical data for use in pre-excavation waste characterization planning.

At each of the 68 boring locations, soil samples were collected from depths of approximately 2, 10, 15, and 20 feet bgs. As shown on Figure 2, the 68 soil borings were divided into 17 groups of four borings each. Within each group, samples from the same depth were composited by the analytical laboratory, such that samples from each depth interval listed above were combined to create a four-point composite sample. Samples from the common depth intervals were composited together so that each depth interval can be characterized separately for disposal purposes.

Analytical results and a comparison to hazardous waste criteria are provided in Tables 1 and 2 and key findings are summarized below.

- The results of metals testing indicated that all metal results are below hazardous waste criteria. Metals detections were generally within the range of typical natural background concentrations for each metal. Hexavalent chromium was not detected at any location.
- Petroleum hydrocarbons were detected in the shallow soil composite samples from several locations. Concentrations of TPH-G ranged from non-detect to 9.3 mg/kg. Concentrations of TPH-D ranged from non-detect to 170 mg/kg. Concentrations of TPH-MO ranged from non-detect to 1,200 mg/kg.
- The organochlorine pesticides DDD and DDE were detected at one location at concentrations slightly above the laboratory reporting limit. The concentrations are well below hazardous waste criteria. PCBs were not detected in any of the shallow soil composite samples.
- All soil borings were screened for the presence of VOCs using a calibrated photoionization detector (PID). Composite samples in which individual sample(s) had a positive PID screening response were analyzed for VOCs. Based on the results of VOC analyses performed on select composite samples, only trace levels of VOCs were detected, including acetone, carbon disulfide, and 1,2,4-trimethybenzene.
- None of the composite samples analyzed for naturally-occurring asbestos showed any indication of asbestos fibers within the soil matrix.

NOTES

Highlighted data exceeds threshold value at which additional leaching tests are necessary to evaluate whether the material may exceed state or federal hazardous waste criteria.

Detections are shown in **bold font**.

All samples represent depth-specific four-point composite groups. At several locations, a 5th sample was added to the composite group in order to ensure a representative composite sample. Footnotes addressing these samples are defined as follows:

a: Composite sample group 470-G1-2 includes a 4 foot depth sample from Boring 3.
b: Composite sample group 1830-G2-2 includes a 5 foot depth sample from Boring 3.
c: Composite sample group 1830-G7-2 includes a 5 foot depth sample from Boring 1.
d: Composite sample group 1830-G9-2 includes a 5 foot depth sample from Boring 2.
e: Composite sample group 1830-G10-2 includes a 4 foot depth sample from Boring 1.
f: Composite sample group 1830-G11-2 includes a 5 foot depth sample from Boring 3.

--: not analyzed
bgs: below ground surface
mg/kg: milligrams per kilogram
mg/L: milligrams per liter
na: not available
ND<##: Not detected at or above laboratory reporting limit shown
STLC: Soluble Threshold Limit Concentration
TCLP: Toxicity Characteristic Leaching Procedure
TTLC: Total Threshold Limit Concentration

NOTES

Detections are shown in **bold font**.

All samples represent depth-specific four-point composite groups. At several locations, a 5th sample was added to the composite group in order to ensure a representative composite sample. Footnotes addressing these samples are defined as follows:

a: Composite sample group 470-G1-2 includes a 4 foot depth sample from Boring 3.
b: Composite sample group 1830-G2-2 includes a 5 foot depth sample from Boring 3.
c: Composite sample group 1830-G7-2 includes a 5 foot depth sample from Boring 1.
d: Composite sample group 1830-G9-2 includes a 5 foot depth sample from Boring 2.
e: Composite sample group 1830-G10-2 includes a 4 foot depth sample from Boring 1.
f: Composite sample group 1830-G11-2 includes a 5 foot depth sample from Boring 3.

--: not analyzed
1,2,4-TMB: 1,2,4-trimethylbenzene
bgs: below ground surface
DDD: 1,1-dichloro-2,2-bis(4-chlorophenyl)ethane
DDE: 1,1-dichloro-2,2-bis(4-chlorophenyl)ethene
mg/kg: milligrams per kilogram
na: not available
ND<##: Not detected at or above laboratory reporting limit shown
PCBs: Polychlorinated biphenyl
STLC: Soluble Threshold Limit Concentration
TCLP: Toxicity Characteristic Leaching Procedure
TPH: Total petroleum hydrocarbons
TTLC: Total Threshold Limit Concentration
VOCs: Volatile organic compounds

From: ENVIRON

Re: Environmental Sampling at 470 Concar Drive and 1830 South Delaware Street

The following summarizes recent environmental sampling ENVIRON performed at two adjacent parcels, 470 Concar Drive and 1830 South Delaware Street in San Mateo (the "Property"), on behalf of Hines Interests. The Property is currently used for commercial purposes. Hines is considering acquiring the property for commercial redevelopment (no residential).

- Initial sampling event completed April 1 - 3, 2008
  - Soil, groundwater, and soil gas sampled across the site
  - No organic constituents detected in soil above ESLs
  - Benzene sporadically detected at low levels in soil gas (above ESL in one location)
  - Methane detected in soil gas above 10% of LEL at three locations
  - 1,2-DCA detected in groundwater above ESLs at two locations on 470 Concar Drive
  - No other organic constituents detected in groundwater above ESLs
- Second sampling event completed April 29 - 30, 2008
  - Soil and groundwater sampled only on 470 Concar Drive
  - Sampling event designed to investigate 1,2-DCA found in groundwater during initial sampling event
  - No VOCs detected in soil above ESLs
  - 1,2-DCA detected in groundwater above ESLs at four locations (highest concentrations at the southern site boundary)
  - No other organic constituents detected in groundwater above ESLs
- Findings and Conclusions
  - Relatively low-level and sporadic detections of petroleum hydrocarbons in soil and groundwater can be addressed through soil management plan during construction
  - Relatively low levels of VOCs and other constituents (e.g., methane) in soil gas can be addressed through assessment and (if required) control of vapor intrusion that is accounted for in construction plans
  - Relatively low levels of VOCs in groundwater encountered during construction activities are generally below City of San Mateo sewer discharge limitations
  - VOCs identified on 1830 S. Delaware Street (previously characterized and found to be acceptable to the City and County during issuance of prior project approval in 2001/2) appear to be associated with off-site gasoline service stations currently being addressed under County oversight
  - Concentrations and pattern of VOCs in groundwater on 470 Concar Drive are consistent with off-site source(s) to the south

April 07, 2008

Dear Dan:

Enclosed within are:

1) The results of the **6** analyzed samples from your project: **#03-20357A; 1830 Delaware/ 470 C**
2) A QC report for the above samples,
3) A copy of the chain of custody, and
4) An invoice for analytical services.

All analyses were completed satisfactorily and all QC samples were found to be within our control limits.

If you have any questions or concerns, please feel free to give me a call. Thank you for choosing

McCampbell Analytical Laboratories for your analytical needs.

Best regards,

Angela Rydelius
Laboratory Manager
McCampbell Analytical, Inc.

6		7		8		9		10	
11		12							

The following SampIDs: 001B, 002B, 003B, 004B, 005B contain testgroup.

Prepared by: Ana Venegas

Comments: 48hr rush

NOTE: Soil samples are discarded 60 days after results are reported unless other arrangements are made (Water samples are 30 days).
Hazardous samples will be returned to client or disposed of at client expense.

Sample Receipt Checklist

Client Name: **Environ** Date and Time Received: **04/03/08 5:52:49 PM**

Project Name: **#03-20357A; 1830 Delaware/ 470 Coneas, San Ma** Checklist completed and reviewed by: Ana Venegas

WorkOrder N°: **0804089** Matrix Water Carrier: Derik Cartan (MAI Courier)

Chain of Custody (COC) Information

Chain of custody present?	Yes ☑	No ☐
Chain of custody signed when relinquished and received?	Yes ☑	No ☐
Chain of custody agrees with sample labels?	Yes ☑	No ☐
Sample IDs noted by Client on COC?	Yes ☑	No ☐
Date and Time of collection noted by Client on COC?	Yes ☑	No ☐
Sampler's name noted on COC?	Yes ☑	No ☐

Sample Receipt Information

Custody seals intact on shipping container/cooler?	Yes ☐	No ☐	NA ☑
Shipping container/cooler in good condition?	Yes ☑	No ☐	
Samples in proper containers/bottles?	Yes ☑	No ☐	
Sample containers intact?	Yes ☑	No ☐	
Sufficient sample volume for indicated test?	Yes ☑	No ☐	

Sample Preservation and Hold Time (HT) Information

All samples received within holding time?	Yes ☑	No ☐	
Container/Temp Blank temperature	Cooler Temp: 10.9°C		NA ☐
Water - VOA vials have zero headspace / no bubbles?	Yes ☑	No ☐	No VOA vials submitted ☐
Sample labels checked for correct preservation?	Yes ☑	No ☐	
TTLC Metal - pH acceptable upon receipt (pH<2)?	Yes ☐	No ☐	NA ☑

%SS3:	95		

Comments: i

* water and vapor samples are reported in µg/L, soil/sludge/solid samples in mg/kg, product/oil/non-aqueous liquid samples and all TCLP & SPLP extracts are reported in mg/L, wipe samples in µg/wipe.

ND means not detected above the reporting limit; N/A means analyte not applicable to this analysis.

surrogate diluted out of range or coelutes with another peak; &) low surrogate due to matrix interference.

h) lighter than water immiscible sheen/product is present; i) liquid sample that contains greater than ~1 vol. % sediment; j) sample diluted due to high organic content/matrix interference; J) analyte detected below quantitation limits; k) reporting limit near, but not identical to our standard reporting limit due to variable Encore sample weight; m) reporting limit raised due to insufficient sample amount; n) results are reported on a dry weight basis; p) see attached narrative; q) reported in ppm.

Comments:

* water and vapor samples are reported in µg/L, soil/sludge/solid samples in mg/kg, product/oil/non-aqueous liquid samples and all TCLP & SPLP extracts are reported in mg/L, wipe samples in µg/wipe.

ND means not detected above the reporting limit; N/A means analyte not applicable to this analysis.

surrogate diluted out of range or coelutes with another peak; &) low surrogate due to matrix interference.

h) lighter than water immiscible sheen/product is present; i) liquid sample that contains greater than ~1 vol. % sediment; j) sample diluted due to high organic content/matrix interference; J) analyte detected below quantitation limits; k) reporting limit near, but not identical to our standard reporting limit due to variable Encore sample weight; m) reporting limit raised due to insufficient sample amount; n) results are reported on a dry weight basis; p) see attached narrative; q) reported in ppm.

Zinc	ND				NA	5.0
%SS:	N/A					

Comments

*water samples are reported in µg/L, product/oil/non-aqueous liquid samples and all TCLP / STLC / DISTLC / SPLP extracts are reported in mg/L, soil/sludge/solid samples in mg/kg, wipe samples in µg/wipe, filter samples in µg/filter.

means surrogate diluted out of range; ND means not detected above the reporting limit; N/A means not applicable to this sample or instrument.

TOTAL = acid digestion.
WET = Waste Extraction Test (STLC).
DI WET = Waste Extraction Test using de-ionized water.

i) aqueous sample containing greater than ~1 vol. % sediment; for DISSOLVED metals, this sample has been preserved prior to filtration; for TOTAL metals, a representative sediment-water mixture was digested; j) reporting limit raised due to insufficient sample amount; k) reporting limit raised due to matrix interference; m) estimated value due to low/high surrrogate recovery, caused by matrix interference; n) results are reported on a dry weight basis; p) see attached narrative.

MS = Matrix Spike; MSD = Matrix Spike Duplicate; LCS = Laboratory Control Sample; LCSD = Laboratory Control Sample Duplicate; RPD = Relative Percent Deviation.

% Recovery = 100 * (MS-Sample) / (Amount Spiked); RPD = 100 * (MS - MSD) / ((MS + MSD) / 2).

MS / MSD spike recoveries and / or %RPD may fall outside of laboratory acceptance criteria due to one or more of the following reasons: a) the sample is inhomogenous AND contains significant concentrations of analyte relative to the amount spiked, or b) the spiked sample's matrix interferes with the spike recovery.

N/A = not enough sample to perform matrix spike and matrix spike duplicate.

NR = analyte concentration in sample exceeds spike amount for soil matrix or exceeds 2x spike amount for water matrix or sample diluted due to high matrix or analyte content.

Laboratory extraction solvents such as methylene chloride and acetone may occasionally appear in the method blank at low levels.

WorkOrder: 0804063

April 07, 2008

Dear Wendy:

Enclosed within are:

1) The results of the **13** analyzed samples from your project: **# 03-20357A; 1830 Delaware,**
2) A QC report for the above samples,
3) A copy of the chain of custody, and
4) An invoice for analytical services.

All analyses were completed satisfactorily and all QC samples were found to be within our control limits.

If you have any questions or concerns, please feel free to give me a call. Thank you for choosing

McCampbell Analytical Laboratories for your analytical needs.

Best regards,

Angela Rydelius

Comments:

* water and vapor samples are reported in µg/L, soil/sludge/solid samples in mg/kg, product/oil/non-aqueous liquid samples and all TCLP & SPLP extracts are reported in mg/L, wipe samples in µg/wipe.

ND means not detected above the reporting limit; N/A means analyte not applicable to this analysis.

surrogate diluted out of range or coelutes with another peak; &) low surrogate due to matrix interference.

h) lighter than water immiscible sheen/product is present; i) liquid sample that contains greater than ~1 vol. % sediment; j) sample diluted due to high organic content/matrix interference; J) analyte detected below quantitation limits; k) reporting limit near, but not identical to our standard reporting limit due to variable Encore sample weight; m) reporting limit raised due to insufficient sample amount; n) results are reported on a dry weight basis; p) see attached narrative; q) reported in ppm.

Comments:

* water and vapor samples are reported in µg/L, soil/sludge/solid samples in mg/kg, product/oil/non-aqueous liquid samples and all TCLP & SPLP extracts are reported in mg/L, wipe samples in µg/wipe.

ND means not detected above the reporting limit; N/A means analyte not applicable to this analysis.

surrogate diluted out of range or coelutes with another peak; &) low surrogate due to matrix interference.

h) lighter than water immiscible sheen/product is present; i) liquid sample that contains greater than ~1 vol. % sediment; j) sample diluted due to high organic content/matrix interference; J) analyte detected below quantitation limits; k) reporting limit near, but not identical to our standard reporting limit due to variable Encore sample weight; m) reporting limit raised due to insufficient sample amount; n) results are reported on a dry weight basis; p) see attached narrative; q) reported in ppm.

Comments:

* water and vapor samples are reported in µg/L, soil/sludge/solid samples in mg/kg, product/oil/non-aqueous liquid samples and all TCLP & SPLP extracts are reported in mg/L, wipe samples in µg/wipe.

ND means not detected above the reporting limit; N/A means analyte not applicable to this analysis.

surrogate diluted out of range or coelutes with another peak; &) low surrogate due to matrix interference.

h) lighter than water immiscible sheen/product is present; i) liquid sample that contains greater than ~1 vol. % sediment; j) sample diluted due to high organic content/matrix interference; J) analyte detected below quantitation limits; k) reporting limit near, but not identical to our standard reporting limit due to variable Encore sample weight; m) reporting limit raised due to insufficient sample amount; n) results are reported on a dry weight basis; p) see attached narrative; q) reported in ppm.

Comments					

*water samples are reported in µg/L, product/oil/non-aqueous liquid samples and all TCLP / STLC / DISTLC / SPLP extracts are reported in mg/L, soil/sludge/solid samples in mg/kg, wipe samples in µg/wipe, filter samples in µg/filter.

means surrogate diluted out of range; ND means not detected above the reporting limit; N/A means not applicable to this sample or instrument.

TOTAL = acid digestion.
WET = Waste Extraction Test (STLC).
DI WET = Waste Extraction Test using de-ionized water.

i) aqueous sample containing greater than ~1 vol. % sediment; for DISSOLVED metals, this sample has been preserved prior to filtration; for TOTAL metals, a representative sediment-water mixture was digested; j) reporting limit raised due to insufficient sample amount; J) analyte detected below quantitation limits; k) reporting limit raised due to matrix interference; m) estimated value due to low/high surrrogate recovery, caused by matrix interference; n) results are reported on a dry weight basis; p) see attached narrative.

MS = Matrix Spike; MSD = Matrix Spike Duplicate; LCS = Laboratory Control Sample; LCSD = Laboratory Control Sample Duplicate; RPD = Relative Percent Deviation.

% Recovery = 100 * (MS-Sample) / (Amount Spiked); RPD = 100 * (MS - MSD) / ((MS + MSD) / 2).

MS / MSD spike recoveries and / or %RPD may fall outside of laboratory acceptance criteria due to one or more of the following reasons: a) the sample is inhomogenous AND contains significant concentrations of analyte relative to the amount spiked, or b) the spiked sample's matrix interferes with the spike recovery.

N/A = not enough sample to perform matrix spike and matrix spike duplicate.

NR = analyte concentration in sample exceeds spike amount for soil matrix or exceeds 2x spike amount for water matrix or sample diluted due to high matrix or analyte content.

Laboratory extraction solvents such as methylene chloride and acetone may occasionally appear in the method blank at low levels.

Lab ID	Date Sampled	Date Extracted	Date Analyzed	Lab ID	Date Sampled	Date Extracted	Date Analyzed
0804063-011B	04/02/08 2:20 PM	04/02/08	04/07/08 12:19 PM	0804063-012B	04/02/08 2:25 PM	04/02/08	04/04/08 1:50 PM

MS = Matrix Spike; MSD = Matrix Spike Duplicate; LCS = Laboratory Control Sample; LCSD = Laboratory Control Sample Duplicate; RPD = Relative Percent Deviation.

% Recovery = 100 * (MS-Sample) / (Amount Spiked); RPD = 100 * (MS - MSD) / ((MS + MSD) / 2).

MS / MSD spike recoveries and / or %RPD may fall outside of laboratory acceptance criteria due to one or more of the following reasons: a) the sample is inhomogenous AND contains significant concentrations of analyte relative to the amount spiked, or b) the spiked sample's matrix interferes with the spike recovery.

N/A = not enough sample to perform matrix spike and matrix spike duplicate.

NR = analyte concentration in sample exceeds spike amount for soil matrix or exceeds 2x spike amount for water matrix or sample diluted due to high matrix or analyte content.

0804063-009A	04/02/08 3:30 PM	04/02/08	04/05/08 9:34 AM				

MS = Matrix Spike; MSD = Matrix Spike Duplicate; LCS = Laboratory Control Sample; LCSD = Laboratory Control Sample Duplicate; RPD = Relative Percent Deviation.

% Recovery = 100 * (MS-Sample) / (Amount Spiked); RPD = 100 * (MS - MSD) / ((MS + MSD) / 2).

MS / MSD spike recoveries and / or %RPD may fall outside of laboratory acceptance criteria due to one or more of the following reasons: a) the sample is inhomogenous AND contains significant concentrations of analyte relative to the amount spiked, or b) the spiked sample's matrix interferes with the spike recovery.

N/A = not enough sample to perform matrix spike and matrix spike duplicate.

NR = analyte concentration in sample exceeds spike amount for soil matrix or exceeds 2x spike amount for water matrix or sample diluted due to high matrix or analyte content.

SUBJECT: DATA REPORT - Environ Project # 03-20357A
1830 South Delaware Street, San Mateo, California

TEG Project # 80403D

Ms. Seider:

Please find enclosed a data report for the samples analyzed from the above referenced project for Environ. The samples were analyzed on site in TEG's mobile laboratory. TEG conducted a total of 36 analyses on 18 soil vapor samples.

-- 18 analyses on soil vapors for volatile organic hydrocarbons by EPA method 8260B.

-- 18 analyses on soil vapors for methane by EPA method 8015m.

The results of the analyses are summarized in the enclosed tables. Applicable detection limits and calibration data are included in the tables.

1,1 difluoroethane was used as a leak check compound around the probe rods during the soil vapor sampling. No 1,1 difluoroethane was detected in any of the vapor samples reported at or above the DTSC recommended leak check compound reporting limit of 10 µg/L of vapor.

TEG appreciates the opportunity to have provided analytical services to Environ on this project. If you have any further questions relating to these data or report, please do not hesitate to contact us.

Sincerely,

Mark Jerpbak
Director, TEG-Northern California

WorkOrder: 0804722

May 06, 2008

Dear Dan:

Enclosed within are:

1) The results of the **10** analyzed samples from your project: **#03-20357A; San Mateo Kenmark, 4**
2) A QC report for the above samples,
3) A copy of the chain of custody, and
4) An invoice for analytical services.

All analyses were completed satisfactorily and all QC samples were found to be within our control limits.

If you have any questions or concerns, please feel free to give me a call. Thank you for choosing

McCampbell Analytical Laboratories for your analytical needs.

Best regards,

Angela Rydelius
Laboratory Manager

Comments:

* water and vapor samples are reported in µg/L, soil/sludge/solid samples in mg/kg, product/oil/non-aqueous liquid samples and all TCLP & SPLP extracts are reported in mg/L, wipe samples in µg/wipe.

ND means not detected above the reporting limit; N/A means analyte not applicable to this analysis.

surrogate diluted out of range or coelutes with another peak; &) low surrogate due to matrix interference.

h) lighter than water immiscible sheen/product is present; i) liquid sample that contains greater than ~1 vol. % sediment; j) reporting limit raised due to high organic content/matrix interference; k) reporting limit near, but not identical to our standard reporting limit due to variable Encore sample weight; m) reporting limit raised due to insufficient sample amount; n) results are reported on a dry weight basis; p) see attached narrative.

MS = Matrix Spike; MSD = Matrix Spike Duplicate; LCS = Laboratory Control Sample; LCSD = Laboratory Control Sample Duplicate; RPD = Relative Percent Deviation.

% Recovery = 100 * (MS-Sample) / (Amount Spiked); RPD = 100 * (MS - MSD) / ((MS + MSD) / 2).

MS / MSD spike recoveries and / or %RPD may fall outside of laboratory acceptance criteria due to one or more of the following reasons: a) the sample is inhomogenous AND contains significant concentrations of analyte relative to the amount spiked, or b) the spiked sample's matrix interferes with the spike recovery.

N/A = not enough sample to perform matrix spike and matrix spike duplicate.

NR = analyte concentration in sample exceeds spike amount for soil matrix or exceeds 2x spike amount for water matrix or sample diluted due to high matrix or analyte content.

Laboratory extraction solvents such as methylene chloride and acetone may occasionally appear in the method blank at low levels.

	Client P.O.:	Date Completed: 05/08/08

WorkOrder: 0804765

May 08, 2008

Dear Wendy:

Enclosed within are:

1) The results of the **10** analyzed samples from your project: **#03-20357A; San Mateo Kenmark, 4**
2) A QC report for the above samples,
3) A copy of the chain of custody, and
4) An invoice for analytical services.

All analyses were completed satisfactorily and all QC samples were found to be within our control limits.

If you have any questions or concerns, please feel free to give me a call. Thank you for choosing

McCampbell Analytical Laboratories for your analytical needs.

Best regards,

Angela Rydelius

Prepared by: Ana Venegas

Comments:

NOTE: Soil samples are discarded 60 days after results are reported unless other arrangements are made (Water samples are 30 days).
Hazardous samples will be returned to client or disposed of at client expense.

Project Name: **#03-20357A; San Mateo Kenmark, 470 Concar Dr.**

Checklist completed and reviewed by: Ana Venegas

WorkOrder N°: **0804765** Matrix Water

Carrier: Michael Hernandez (MAI Courier)

Chain of Custody (COC) Information

Chain of custody present?	Yes ☑	No ☐
Chain of custody signed when relinquished and received?	Yes ☑	No ☐
Chain of custody agrees with sample labels?	Yes ☑	No ☐
Sample IDs noted by Client on COC?	Yes ☑	No ☐
Date and Time of collection noted by Client on COC?	Yes ☑	No ☐
Sampler's name noted on COC?	Yes ☑	No ☐

Sample Receipt Information

Custody seals intact on shipping container/cooler?	Yes ☐	No ☐	NA ☑
Shipping container/cooler in good condition?	Yes ☑	No ☐	
Samples in proper containers/bottles?	Yes ☑	No ☐	
Sample containers intact?	Yes ☑	No ☐	
Sufficient sample volume for indicated test?	Yes ☑	No ☐	

Sample Preservation and Hold Time (HT) Information

All samples received within holding time?	Yes ☑	No ☐	
Container/Temp Blank temperature	Cooler Temp: 8.9°C		NA ☐
Water - VOA vials have zero headspace / no bubbles?	Yes ☑	No ☐	No VOA vials submitted ☐
Sample labels checked for correct preservation?	Yes ☑	No ☐	
TTLC Metal - pH acceptable upon receipt (pH<2)?	Yes ☐	No ☐	NA ☑

%SS3:	111		

Comments: i

* water and vapor samples are reported in µg/L, soil/sludge/solid samples in mg/kg, product/oil/non-aqueous liquid samples and all TCLP & SPLP extracts are reported in mg/L, wipe samples in µg/wipe.

ND means not detected above the reporting limit; N/A means analyte not applicable to this analysis.

surrogate diluted out of range or coelutes with another peak; &) low surrogate due to matrix interference.

h) lighter than water immiscible sheen/product is present; i) liquid sample that contains greater than ~1 vol. % sediment; j) sample diluted due to high organic content/matrix interference; J) analyte detected below quantitation limits; k) reporting limit near, but not identical to our standard reporting limit due to variable Encore sample weight; m) reporting limit raised due to insufficient sample amount; n) results are reported on a dry weight basis; p) see attached narrative; q) reported in ppm.

ND means not detected above the reporting limit; N/A means analyte not applicable to this analysis.

surrogate diluted out of range or coelutes with another peak; &) low surrogate due to matrix interference.

h) lighter than water immiscible sheen/product is present; i) liquid sample that contains greater than ~1 vol. % sediment; j) sample diluted due to high organic content/matrix interference; J) analyte detected below quantitation limits; k) reporting limit near, but not identical to our standard reporting limit due to variable Encore sample weight; m) reporting limit raised due to insufficient sample amount; n) results are reported on a dry weight basis; p) see attached narrative; q) reported in ppm.

Comments: i

* water and vapor samples are reported in µg/L, soil/sludge/solid samples in mg/kg, product/oil/non-aqueous liquid samples and all TCLP & SPLP extracts are reported in mg/L, wipe samples in µg/wipe.

ND means not detected above the reporting limit; N/A means analyte not applicable to this analysis.

surrogate diluted out of range or coelutes with another peak; &) low surrogate due to matrix interference.

h) lighter than water immiscible sheen/product is present; i) liquid sample that contains greater than ~1 vol. % sediment; j) sample diluted due to high organic content/matrix interference; J) analyte detected below quantitation limits; k) reporting limit near, but not identical to our standard reporting limit due to variable Encore sample weight; m) reporting limit raised due to insufficient sample amount; n) results are reported on a dry weight basis; p) see attached narrative; q) reported in ppm.

MS = Matrix Spike; MSD = Matrix Spike Duplicate; LCS = Laboratory Control Sample; LCSD = Laboratory Control Sample Duplicate; RPD = Relative Percent Deviation.

% Recovery = 100 * (MS-Sample) / (Amount Spiked); RPD = 100 * (MS - MSD) / ((MS + MSD) / 2).

MS / MSD spike recoveries and / or %RPD may fall outside of laboratory acceptance criteria due to one or more of the following reasons: a) the sample is inhomogenous AND contains significant concentrations of analyte relative to the amount spiked, or b) the spiked sample's matrix interferes with the spike recovery.

N/A = not enough sample to perform matrix spike and matrix spike duplicate.

NR = analyte concentration in sample exceeds spike amount for soil matrix or exceeds 2x spike amount for water matrix or sample diluted due to high matrix or analyte content.

Laboratory extraction solvents such as methylene chloride and acetone may occasionally appear in the method blank at low levels.

Glossary of Terms & Qualifier Definitions

Client: Environ
Project: #03-33453A
WorkOrder: 1309652

Glossary Abbreviation	Description
95% Interval	95% Confident Interval
DF	Dilution Factor
LCS	Laboratory Control Sample
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ND	Not detected at or above the indicated MDL or RL
NR	Analyte concentration in sample exceeds spike amount for soil matrix or exceeds 2x spike amount for water matrix; or sample diluted due to high matrix or analyte content.
RL	Reporting Limit
RPD	Relative Percent Deviation
SPK Val	Spike Value
SPKRef Val	Spike Reference Value

Quality Control Qualifier	
F1	MS/MSD recovery was out of acceptance criteria; LCS validated the prep batch.

Glossary of Terms & Qualifier Definitions

Client: Environ
Project: Hines 2014
WorkOrder: 1411066

Glossary Abbreviation

95% Interval	95% Confident Interval
DF	Dilution Factor
DUP	Duplicate
EDL	Estimated Detection Limit
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
TEQ	Toxicity Equivalence

Analytical Qualifiers

a3	sample diluted due to high organic content.
d7	strongly aged gasoline or diesel range compounds are significant in the TPH(g) chromatogram
e2	diesel range compounds are significant; no recognizable pattern
e7	oil range compounds are significant

Bulk Asbestos Material Analysis

(Air Resources Board Method 435, June 6, 1991)

McCampbell Analytical, Inc.
Account Payable
1534 Wilow Pass Rd

Pittsburg, CA 94565

Client ID: A31409
Report Number: N006780
Date Received: 11/12/14
Date Analyzed: 11/19/14
Date Printed: 11/21/14

Job ID/Site: 1411372 - #03-33453C, Hines 2014

PLM Report Number: N/A

FALI Job ID: A31409
Total Samples Submitted: 16
Total Samples Analyzed: 16

Sample Preparation and Analysis:

Samples were analyzed by the Air Resources Board's Method 435, Determination of Asbestos Content of Serpentine Aggregate. Samples were ground to 200 particle size in the laboratory. Approximately 1 pint was retained for analysis. Samples were prepared for observation according to the guidelines of Exception I and Exception II as defined by the 435 Method. Samples which contained less than 10% asbestos were prepared for observation according to the point count technique as defined by the 435 Method. This analysis was performed with a standard cross-hair reticle.

Sample ID	Lab Number	Layer Description
470-G2-2	11580833	**Tan Soil**

Visual Estimation Results:

Matrix percentage of entire 100
Visual estimation percentage: **None Detected**
Asbestos type(s) detected: None Detected

Comment: This result meets the requirements of Exception I as defined by the 435 Method.

Comment: This result meets the requirements of Exception I as defined by the 435 Method.

Sample ID	Lab Number	Layer Description
470-G4-20	11580844	**Brown Soil**

Visual Estimation Results:

Matrix percentage of entire 100
Visual estimation percentage: **None Detected**
Asbestos type(s) detected: None Detected

Comment: This result meets the requirements of Exception I as defined by the 435 Method.

3777 Depot Road, Suite 409, Hayward, CA 94545 / Telephone: (510) 887-8828 (800) 827-FASI / Fax: (510) 887-4218

Bulk Asbestos Material Analysis

(Air Resources Board Method 435, June 6, 1991)

McCampbell Analytical, Inc.
Account Payable
1534 Wilow Pass Rd

Pittsburg, CA 94565

Client ID: A31409
Report Number: N006780
Date Received: 11/12/14
Date Analyzed: 11/19/14
Date Printed: 11/21/14

Job ID/Site: 1411372 - #03-33453C, Hines 2014

PLM Report Number: N/A

FALI Job ID: A31409
Total Samples Submitted: 16
Total Samples Analyzed: 16

Sample Preparation and Analysis:

Samples were analyzed by the Air Resources Board's Method 435, Determination of Asbestos Content of Serpentine Aggregate. Samples were ground to 200 particle size in the laboratory. Approximately 1 pint was retained for analysis. Samples were prepared for observation according to the guidelines of Exception I and Exception II as defined by the 435 Method. Samples which contained less than 10% asbestos were prepared for observation according to the point count technique as defined by the 435 Method. This analysis was performed with a standard cross-hair reticle.

Sample ID	Lab Number	Layer Description
1830-G10-2	11580845	**Brown Soil**

Visual Estimation Results:

Matrix percentage of entire 100
Visual estimation percentage: **None Detected**
Asbestos type(s) detected: None Detected

Comment: This result meets the requirements of Exception I as defined by the 435 Method.

Sample ID	Lab Number	Layer Description
1830-G10-10	11580846	**Brown Soil**

Visual Estimation Results:

Matrix percentage of entire 100
Visual estimation percentage: **None Detected**
Asbestos type(s) detected: None Detected

Comment: This result meets the requirements of Exception I as defined by the 435 Method.

Sample ID	Lab Number	Layer Description
1830-G10-15	11580847	**Tan Soil**

Visual Estimation Results:

Matrix percentage of entire 100
Visual estimation percentage: **None Detected**
Asbestos type(s) detected: None Detected

Comment: This result meets the requirements of Exception I as defined by the 435 Method.

Sample ID	Lab Number	Layer Description
1830-G10-20	11580848	**Tan Soil**

Visual Estimation Results:

Matrix percentage of entire 100
Visual estimation percentage: **None Detected**
Asbestos type(s) detected: None Detected

Comment: This result meets the requirements of Exception I as defined by the 435 Method.

Tad Thrower, Laboratory Supervisor, Hayward Laboratory

Note: Limit of Quantification (LOQ) = 0.25%. Trace denotes the presence of asbestos below the LOQ. ND = None Detected.

Analytical results and reports are generated by Forensic Analytical Laboratories Inc. (FALI) at the request of and for the exclusive use of the person or entity (client) named on such report. Results, reports or copies of same will not be released by FALI to any third party without prior written request from client. This report applies only to the sample(s) tested. Supporting laboratory documentation is available upon request. This report must not be reproduced except in full, unless approved by FALI. The client is solely responsible for the use and interpretation of test results and reports requested from FALI. Forensic Analytical Laboratories Inc. is not able to assess the degree of hazard resulting from materials analyzed. FALI reserves the right to dispose of all samples after a period of thirty (30) days, according to all state and federal guidelines, unless otherwise specified. All samples were received in acceptable condition unless otherwise noted.

Glossary of Terms & Qualifier Definitions

Client: Environ
Project: #03-33453C; Hines 2014
WorkOrder: 1411430

Glossary Abbreviation

95% Interval	95% Confident Interval
DF	Dilution Factor
DUP	Duplicate
EDL	Estimated Detection Limit
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
TEQ	Toxicity Equivalence

Analytical Qualifiers

a3	sample diluted due to high organic content.
d7	strongly aged gasoline or diesel range compounds are significant in the TPH(g) chromatogram
e2	diesel range compounds are significant; no recognizable pattern
e7	oil range compounds are significant

Quality Control Qualifiers

F1	MS/MSD recovery and/or RPD was out of acceptance criteria; LCS validated the prep batch.
